2. Automatic or habitual behavior patterns develop over time through reinforcement, but can be unlearned

B Behavioral therapy is effective in developing skills in individuals with limited cognitive skills (e.g., children, mentally retarded) and for individuals with disorders with significant behavioral components (e.g., phobias, compulsions)

C Consistent nursing responses are essential for behavioral interventions

D Examples of behavioral therapy include

1. Contracting: client agrees, orally or in writing, to change dysfunctional behavior; contracts include specific behavior to be modified, the positive reinforcers, and the consequences if contract is broken
2. Token/reward system: desired behavior receives concrete positive reinforcement (e.g., colorful stickers during toilet training for child)
3. Desensitization (exposure therapy): client is exposed to slowly increasing experiences with an anxiety-producing stimulus while practicing behavioral techniques such as relaxation or deep breathing
4. Flooding: client is exposed to anxiety-producing stimulus continuously in a supportive environment until intensity of response diminishes

## Maslow's Humanistic Theory

A Maslow's humanistic theory, a nondevelopmental theory, postulates that people are guided by a variety of needs, from basic physiologic ones to self-actualization, the need to achieve one's full potential

B The existence of unmet needs and the desire to achieve optimum self-potential are fundamental sources of human motivation. Maslow's Hierarchy of Needs are

1. Physiologic—satisfying needs for oxygen, water, food, shelter, sleep, and relief of sexual tension
2. Safety—avoiding harm and achieving security and safety
3. Love and belonging—giving and receiving affection, developing companionship, group acceptance
4. Esteem—achieving recognition from others leads to self-esteem, prestige, and work

success

5. Self-actualization—achieving one's own unique potential

C With the gratification of basic needs, other higher needs emerge, moving one toward self-potential

D People may simultaneously be working to achieve needs on more than one level

# Anxiety and Coping Behaviors

## Overview

A Anxiety (see [Chapter 19](#), Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood)

1. Diffuse feeling of uneasiness, uncertainty, and helplessness that occurs as a result of a threat to an individual's self-concept, esteem, identity, or safety
2. Usual response to a real or perceived threat
3. Different from fear, which has a specific source or object that can be identified and described
4. An emotion that is subjective in nature and without a specific object
5. Related to one's culture, because culture influences one's values
6. Causes are uncertain, but research indicates a combination of physical, psychosocial, and environmental factors
7. Activates the fight-or-flight response in the autonomic nervous system (See Stress Response in [Chapter 1](#))

B Levels of anxiety

1. Mild—alertness level: automatic response of the central nervous system (CNS) that prepares the body for danger by regulating internal processes and concentrating all energies for internal activity; perceptual field is increased; may enhance learning
2. Moderate—apprehension level: response to anticipation of short-term threat that prepares the individual for efficient performance; perceptual field is narrowed, since focus is on the immediate concern
3. Severe—high anxiety level: focus is on a specific detail, and behavior is aimed at relieving anxiety; needs direction by others to focus on another detail or area; marked reduction in the perceptual field limits cognitive abilities
4. Panic—extreme level: involves disorganization of the personality and is associated with dread and terror; communication abilities and problem solving are nonexistent; has great difficulty following commands even with direction; perceptual field is distorted; prolonged period of panic results in exhaustion and death; intervention is essential

C Behavioral defenses against anxiety ([Table 15-1: Coping Skills: Affective and Problem Solving](#))

---

**Table 15-1**

**Coping Skills: Affective and Problem Solving**

---

Affective	Problem Solving
Pray	Seek advice
Daydream	Obtain another's perspective
Eat, drink, and smoke	Learn new information/skill
Exercise	Set goals
Seek comfort from others	Ask for help
Meditate and do yoga	Do research
Withdraw	Delegate responsibilities
Bathe	Seek alternatives
Sleep	Brainstorm ideas
Make a joke	Draw on past experiences
Cry	Develop new resources
Watch TV or go to a movie	Take action
Take a drive	
Journal	

1. Consciously directed, task-oriented behaviors that are deliberate attempts to problem solve, resolve conflicts, and gratify; they tend to involve the individual's deliberate effort to maintain control, reduce tension, and limit anxiety; they include attack, withdrawal, and compromise behaviors
  - a. Attack behavior: an attempt to overcome obstacles to satisfy a need
    - (1) Constructive behaviors reflect use of problem solving
    - (2) Destructive behaviors usually are accompanied by feelings of anger and hostility and may violate rights, property, and well-being of others
  - b. Withdrawal behavior: can be expressed physically or psychologically
    - (1) Physical withdrawal involves removing oneself from the source of threat
    - (2) Psychologic withdrawal occurs when one admits defeat, becomes apathetic, or lowers aspirations; when this behavior isolates the person or interferes with work production, it causes additional problems
  - c. Compromise is essential in situations that cannot be resolved through attack or withdrawal; it occurs by changing usual methods of operating, altering goals, or adjusting personal needs
    - (1) Compromise behaviors usually are constructive and are noted in approach-approach and avoidance-avoidance situations
    - (2) Compromise solutions can later offer opportunities for renegotiation or adapting different coping mechanisms
2. Task-oriented reactions and effective problem solving are influenced by the

- expectation of some degree of success and drawing on one's past successes to deal with current stressful situations
3. Problem-solving perseverance and the belief that one can endure the discomfort help one find the courage to cope with anxiety
  4. Task-oriented reactions are not always successful in coping with stressful situations; therefore, ego-oriented reactions (defense mechanisms) are often used to protect the self

## Defense Mechanisms

A Defense mechanisms are unconscious cognitive responses that provide protection for the personality from overwhelming anxiety

B Defense mechanisms are most helpful in coping with mild and moderate levels of anxiety because they offer protection from feelings of inadequacy and worthlessness; when used, the individual may have a clear, slightly distorted, or more distorted perception of reality; if used to extreme they may impede interpersonal relationships and limit productivity ([Table 15-2: The Use of Defense Mechanisms in Relation to the Perception of Reality](#))

**Table 15-2**

### The Use of Defense Mechanisms in Relation to the Perception of Reality

Clear Perception of Reality	Slightly Distorted Perception of Reality	More Distorted Perception of Reality
Fantasy	Compensation	Denial
Identification	Conversion	Dissociation
Introjection	Displacement	Regression
Rationalization	Intellectualization	Repression
Sublimation	Projection	
Substitution	Reaction formation	
Suppression	Splitting	
	Undoing	

C Identifiable patterns of response begin to form when individuals respond to most situations with the same type of behavior

D Commonly used defense mechanisms

1. Help an individual to cope with reality
2. Used when instincts are a threat to the self

- a. Compensation: the individual makes up for a perceived lack in one area by emphasizing capabilities in another
- b. Identification: the individual internalizes characteristics of an idealized person
- c. Rationalization: the individual makes acceptable excuses for behavior, feelings, outcomes; attempts to explain behavior by logical reasoning but does not address underlying feelings
- d. Sublimation: the individual substitutes a socially acceptable behavior for an unacceptable instinct
- e. Substitution: the individual replaces an unacceptable emotion or goal by another that is more acceptable

#### E Compensatory-type defense mechanisms

1. Adaptive when used in moderation; if used to excess, frequently they create greater emotional problems
2. As the use of these compensatory defenses increases and encompasses more of the individual's life, contact with reality is disrupted and distortions begin
3. These patterns of behavior are considered deviations and usually are viewed as signs of emotional stress and mental health problems
  - a. Conversion: emotional conflict is unconsciously changed into a physical symptom that can be expressed openly and without anxiety
  - b. Denial: emotional conflict is blocked from the conscious mind, and the individual cannot recognize its existence
  - c. Displacement: emotions related to an emotionally charged situation or object are shifted to a relatively safe substitute situation or object
  - d. Dissociation: separation of any group of mental or behavioral processes from the rest of the individual's consciousness or identity
  - e. Fantasy: conscious distortion of unconscious wishes and needs to obtain gratification and satisfaction
  - f. Intellectualization: use of thinking, ideas, or intellect to avoid emotions
  - g. Introjection: acceptance of another's opinions and values as one's own
  - h. Projection: unconscious denial of unacceptable feelings and emotions in oneself while attributing them to others
  - i. Reaction formation: unconscious prevention of unacceptable thoughts or behaviors from being expressed by exaggerating opposite thoughts or behaviors
  - j. Regression: return to an earlier stage of behavior when stress is overwhelming at the present stage of development
  - k. Repression: involuntary exclusion from consciousness of those ideas, feelings, and situations that are creating conflict and causing discomfort
  - l. Splitting: viewing others or situations as either all good or all bad; failure to integrate the positive and negative qualities in oneself
  - m. Suppression: voluntary exclusion from consciousness of those ideas, feelings, and situations that are creating conflict and causing discomfort
  - n. Undoing: act or communication that attempts to compensate for or negate a previous one

# Dysfunctional Patterns of Behavior

A Various theories (psychoanalytic, developmental, neurobiologic, sociocultural, behavioral, cognitive) identify factors that lead to patterns of behavior that are dysfunctional

1. Psychoanalytic theories focus on interpersonal relationships and communication patterns that are especially influenced by childhood experiences
2. Developmental theories focus on the ability to accomplish age-related tasks
3. Neurobiologic theories focus on brain structure and/or neurochemistry
4. Sociocultural theories focus on learned values, beliefs, norms, and rituals that reinforce behavior
5. Behavioral theories focus on behaviors as learned patterns that have been reinforced
6. Cognitive theories focus on the relationship among beliefs, mindsets, and behavior

B Most dysfunctional behavior result from multiple stressors

C Most people use these behaviors at times to cope, but it is the frequency, extent, and impact they have on overall functioning that will determine if the behaviors are dysfunctional

C Dysfunctional behavior is precipitated by stressors that become overwhelming; influencing factors include the severity, multiplicity, and duration of stressors

D Dysfunctional patterns of behavior usually reflect long-term problems in ability to cope with reality; continued use of these patterns impairs the individual's ability to grow and change and therefore creates further stress

E Dysfunctional patterns of behavior and specific psychiatric diagnoses that can be correlated to certain patterns of dysfunctional behavior include

1. Withdrawn behavior
  - a. Pathologic retreat from, or an avoidance of, people and reality; withdrawn behavior can range from poor socialization to retreat into a private world of delusion, hallucination, and fantasy
  - b. Associated with autism, depression, anxiety, dementia, schizophrenia and other psychotic disorders
2. Projective behavior
  - a. Denial of one's own feelings, faults, and failures while attributing them to other people or objects; projective behavior can range from displacing anger onto a less threatening person to blaming others for one's own addiction or aggressive behavior
  - b. Associated with substance abuse, antisocial personality, paranoid personality, phobias
3. Aggressive behavior
  - a. Physical, symbolic, or verbal behavior that is forceful or hostile and enacted to intimidate others; aggression occurs on a continuum ranging from angry body language to physical violence
  - b. Associated with substance abuse, conduct disorders, mania, delirium, dementia, domestic violence, sexual assault

#### 4. Self-destructive behavior

- a. Indulging in actions that could lead to self-harm (e.g., nonadherence to medical regimens, substance abuse, engaging in high-risk activities) or violence against self (e.g., cutting, overdose); self-destructive behaviors can range from a client with a cardiac problem who fails to follow dietary restrictions to a client who attempts/commits suicide
- b. Associated with depression, mania, borderline personality

#### 5. Addictive behavior

- a. Repeated or chronic use of a substance (e.g., alcohol, drugs, cigarettes) with a resulting dependency on the substance; continued use of the substance despite the occurrence of related problems; the use of a substance may be a form of self-medication for an underlying mental illness. Behaviors such as gambling addiction and compulsive overeating that continue despite occurrence of related problems have not been classified in the DSM-IV-TR but usually are viewed as addictive disorders
- b. Associated with substance abuse, personality disorders, bipolar illness, schizophrenia, attention deficit hyperactivity disorder (ADHD)

## CHAPTER 16

# The Practice of Mental Health/Psychiatric Nursing

---

# Legal Concepts Related to Mental Health/Psychiatric Nursing

## Overview

A A fundamental component of psychiatric nursing is to understand the legal framework used to regulate the care and treatment of clients with mental illness; each state has its own mental health code that delineates the law in this area; therefore, the mental health laws vary from state to state; case law may also set precedents that guide care

B Adherence to the Patient Care Partnership (formerly The Patient's Bill of Rights) is essential

C All civil rights are maintained

D Clients have the right to be treated in the least restrictive environment; any curtailment of autonomy must be substantiated by documentation supporting the need to limit the client's freedom; clients retain the right to a lawyer and the right to request a court hearing; clients may execute a psychiatric advance directive stating treatment preferences

E Types of hospital admissions

1. Voluntary admission: clients of lawful age may apply in writing to be admitted for treatment to a mental health facility; written notice of intent to leave may be required with a waiting period during which the health care provider may choose to change admission status to involuntary
2. Involuntary admission (commitment): clients who have not agreed to treatment are placed in a mental health facility; criteria for involuntary admission in some states are very circumscribed (danger to self or others); in other states requirements are more liberal (mentally ill and in need of treatment, gravely disabled, and/or unable to provide for own basic needs); most states have various routes for involuntary admission that may include
  - a. Emergency hospitalization: used to intervene when there is an immediate threat by a client to self or others; this short-term (48 to 72 hours) commitment is allowed for the assessment of the client and to determine if more long-term commitment is needed or the client can be discharged to outpatient treatment
  - b. Court ordered observational admission: used to assess the mental status of a person in relation to legal activities (e.g., competency to stand trial)
  - c. Formal commitment: used to treat clients with chronic mental illnesses over a prolonged period; periodic reviews may be made at 3, 6, or 12 months
  - d. Two health care provider commitment: two health care providers document that the client has met the state's criteria for involuntary care; most states provide for an intermediate length of time (1 to 6 weeks) admission
  - e. Physician's Emergency Certificate: allows the facility to keep people against their will

F Seclusion and restraint: a client who is a threat to self or others may be placed in a seclusion room or in four-point restraints to prevent injury or harm

1. A health care provider must give an order for seclusion or restraint for each incident and renew it every few hours as determined by state mental health law; prn seclusion and restraint orders are not acceptable
  2. The nurse must document the initial and continued need for seclusion or restraints; the client must be observed constantly if in restraints and checked every 15 minutes if in seclusion; hourly physical assessment must be performed if the client's condition permits
  3. Hydration, nutrition, and elimination needs must be met while the client is in seclusion or restraints
  4. When it is determined that the client is no longer a threat to self or others, the client must be released from seclusion or restraints
  5. Chemical restraint: the nurse may administer a prescribed prn medication without the client's consent if the client is dangerous to self or others
- G Court-ordered medication: a client's right to refuse treatment may be overruled, and the client may be court mandated to take medication to decrease the threat of injury to self or others
- H Psychiatric advance directive: a client with a recurrent/chronic psychiatric disorder may establish an advance directive to guide treatment during a future episode of mental illness when judgment is impaired

## **The Nurse's Responsibilities in Relation to the Law**

- A Implement care that meets the Scope and Standard of Psychiatric-Mental Health Clinical Nursing Practice as described by the American Nurses Association (ANA) and nursing practice laws of the state where practicing (e.g., health promotion, case management, treatment of human responses)
- B Remain current with skills and knowledge base
- C Keep accurate and concise client records
- D Maintain client/family confidentiality; an exception must be made to notify others (e.g., police, intended victim) if a credible threat against another person is made by the client
- E Know the laws governing practice within the state, the rights and duties of the nurse, and the rights of the client
- F Maintain current malpractice liability insurance coverage

# Community Health Services

## Overview

### A Purposes

1. Provide prevention, treatment, and rehabilitation services for individuals with emotional problems; also support for families
2. Maintain individuals and families in the community
3. Provide hospital care within the community in those instances when the individual cannot be maintained on an outpatient basis
4. Emphasize managed care mandates that shift care from costly inpatient treatment to community and home health visits

### B Types of settings in which services are provided

1. Outpatient services
  - a. Storefront clinics, daycare centers, mobile units, intensive outpatient programs, partial hospitalization programs, or day treatment centers
  - b. Walk-in clinics in hospitals and psychiatric emergency departments
  - c. Emergency services
  - d. Crisis intervention centers, mobile crisis units, hot-line phone centers and the Internet
  - e. Private community practice, schools, and shelters
  - f. Dual-diagnoses programs (mental health and chemical dependency)
  - g. Mental health home nursing
  - h. Forensic settings
  - i. Assertive Community Treatment (ACT)
2. Inpatient services
  - a. Specialized psychiatric hospitals, both long-term and short-term care
  - b. General hospital psychiatric units
  - c. Short-term placement; provide respite for caregivers, provide safe environment during episodes of aggressive acting-out
3. Aftercare services
  - a. Foster homes
  - b. Halfway houses
  - c. Sheltered workshops
  - d. Daycare centers

### C Types of services

1. Observation, diagnosis, and determination of client needs
2. Crisis intervention
3. Direct care services to clients, including
  - a. Individual, family, and group therapy
  - b. Pharmacologic therapy
  - c. Electroconvulsive therapy
  - d. Occupational therapy

e. Recreational therapy

4. Therapeutic milieu

a. Supports the individual during the period of crisis

b. Helps the individual learn new ways of coping with problems

5. Referral to other community agencies for necessary services

6. Vocational counseling

7. Health screening

8. Education for professionals and consumers of mental health care

## **The Nurse's Role in Community Nursing**

A Case finding

B Assessment of the individual's needs

C Establishment of the therapeutic milieu

D Consultation and collaboration with other professionals including the interdisciplinary team: health care providers (e.g., physicians, psychologists, advanced practice nurses, physicians assistants), social workers, school teachers, clergy, nursing home and managed adult residential facility staff

E Active participation with the health team, including the individual and family

F Involvement in individual, family, and group therapy

G Supervision of licensed and unlicensed staff members

H Coordination of health services for the individual and family; referral and preparation of client for scheduled appointments

I Education of groups within the community

J Function as client advocate including seeking health insurance parity for reimbursement of costs for psychiatric treatment

K Advanced practice nurses may prescribe medication in some states

# Therapeutic Nurse-Client Relationship

## Overview

- A Phases of a therapeutic nurse-client relationship (see The Nurse-Client Relationship under Communication in [Chapter 2](#))
- B Themes of communication (see The Communication Process under Communication in [Chapter 2](#))
- C Therapeutic communication requires a basic understanding and use of interviewing techniques (see The Nurse-Client Relationship under Communication in [Chapter 2](#))
- D Issues that interfere with a therapeutic relationship during the working phase of a therapeutic relationship
1. Transference: the client superimposes feelings from other relationships onto the nurse-client relationship (e.g., client gets angry easily at nurse who resembles a former significant other with whom the client had a contentious relationship)
  2. Countertransference: the nurse superimposes feelings from other relationships onto the nurse-client relationship (e.g., older nurse treats a younger client like a son or daughter)
  3. Resistance: client fails to engage in or sabotages treatment (e.g., forgets appointments, keeps changing subject)
  4. Blurring of a professional versus a social relationship (see [Table 16-1: Differences Between a Social and a Professional Relationship](#))

**Table 16-1**  
**Differences Between a Social and a Professional Relationship**

Social	Professional
Unstructured time frame	Structured time
Not goal directed	Goal directed
Focus on mutual needs	Focus on client's needs
Nontheoretical	Theory-based interaction
Independent relationships	Part of a treatment team
Informal duties	Legal and ethical duties
No financial concerns	Financial issues
	Confidentiality
	Documentation

## General Nursing Care of Clients with Mental

# Health/Psychiatric Problems

- A Help people to prevent mental health problems and assist clients to cope with mental health problems
- B Accept and respect people as individuals and strive to separate the person from behavior that may be dysfunctional
- C Reorient client to person, place, time, and situation
- D Limit or reject inappropriate behavior without rejecting the individual
- E Help individuals set appropriate limits for themselves or set limits for them when they are unable to do so
- F Recognize that all behavior has meaning and is meeting the needs of the person performing it, regardless of how distorted or meaningless it appears to others
- G Accept the dependency needs of individuals while supporting and encouraging moves toward independence; build on ego strengths
- H Create a nonjudgmental environment that encourages individuals to express their feelings
- I Recognize that individuals need to use their dysfunctional defenses until other healthier defenses can be substituted
- J Recognize how feelings, behavior, and thoughts are interactive and influence relationships
- K Recognize that individuals frequently respond to the behavioral expectations of others: family, peers, and authority figures (e.g., health team members)
- L Recognize that all individuals have a potential for movement toward higher levels of emotional health
- M Include family members in the health care team when they can be supportive and with client approval; recognize that in many cultures family bonds and support are important
- N Base interventions on research evidence (evidence-based practice)

# Crisis Intervention

## Overview

A crisis is an acute, time-limited emotional response to a stressful event or series of stressful events that can be real, potential, or imagined; a crisis can overwhelm a person’s coping abilities ([Table 16-2: Types of Crises](#))

**Table 16-2**  
**Types of Crises**

Type of Crisis	Description
Maturational	Transitions in development require new behaviors and skills (basis of Erikson’s theory); considered normal and often are predictable so that preventive strategies can be implemented (e.g., retirement planning)
Situational	Specific common external events that are not anticipated and create stress (e.g., job loss, amputation of a limb)
Adventitious	Disaster type events that affect groups (e.g., tornado) or unpredictable unusual individual event (e.g., rape)  Some theorists believe that crisis intervention immediately after an adventitious crisis can reduce the incidence of posttraumatic stress disorder

B Crises progress through four distinct phases ([Table 16-3: Caplan’s Phases of Crisis Development](#))

**Table 16-3**  
**Caplan’s Phases of Crisis Development**

Phase	Description
Phase 1	Exposure to stressor (can be real or imagined) causes increasing anxiety as usual coping skills do not bring resolution to the problem.
Phase 2	Utilization of more dysfunctional coping behaviors occurs as high level of anxiety impedes problem solving.
Phase 3	Anxiety reaches panic level when effective coping is lost.
Phase 4	Anxiety overwhelms the individual, who feels immobilized or acts out with violence and self-destructive behaviors; personality disorganization occurs.

C Continuing stress increases vulnerability and causes anxiety and physical discomfort and threatens the person’s self-esteem, integrity, and safety

D The response to a stressor varies from person to person and will be determined by perception of the situation, prior coping skills, the client’s support system, and psychologic and physical health (e.g., some may experience a midlife crisis or empty-nest

syndrome and others may not)

E Crises are usually self-limiting and last between 4 and 6 weeks

F Ineffective coping during a crisis can lead to personality disorganization and long-term maladaptive behaviors

G Crisis intervention is a focused short-term therapy for clients in situations in which their usual coping has been overwhelmed

H The goal is to return the client to precrisis level of functioning, but as the individual tries to regain psychologic equilibrium, there is the opportunity for personal growth by learning new coping skills and developing additional resources

## **Nursing Care of Clients in Crisis**

A Implement interventions that are directive and goal oriented because of the short time frame; focus on present problem and immediate crisis issues only

B Progress through stages: intervening immediately, stabilizing the client, facilitating a realistic understanding of the event, facilitating use of resources, encouraging self-reliance, developing and utilizing healthy support systems

C Assess the client's developmental level, perception of the event, past and current coping skills, resources and support systems, and potential for violence/suicide

D Encourage the client to express feelings and develop healthier coping skills

E Refer the client for more long-term care treatment, to support groups, and to social services as needed

# Nursing Care in Relation to Violence

## Domestic Violence

### Overview

- A Includes child abuse, partner abuse, and elder abuse
- B Abuse can be physical, emotional, sexual, and/or financial
- C Neglect of a dependent child or elder is more common than abuse; neglect is the failure to provide basic care needs such as nutrition, shelter, and health care
- D The incidence of psychiatric illness and addiction disorders is higher in families where there is domestic violence
- E Families where abuse occurs are often isolated, with few support systems, have a history of abusive behaviors, and experience stressors such as unemployment or illness
- F The child who is most likely to be abused has a physical or mental handicap, was born prematurely or at a difficult time in the family's history; such children become scapegoats and are blamed for the family's problems; an elder adult who is abused may have physical or cognitive disabilities that make them more vulnerable and require caregivers to take on more responsibility
- G Societal influences of violence, sexual imagery, cultural norms about family roles, and the use of physical punishment to discipline may increase the tendency toward domestic violence

### Nursing Care of Situations of Domestic Violence/Neglect

- A Identify signs of violence/neglect
  1. Unexplained or frequent injuries or accidents, conflicting stories about injuries, delayed treatment for injuries, injuries in various stages of healing
  2. Failure to thrive; delayed growth and development
  3. Inadequate hygiene, inappropriate dress, and eating and sleeping disorders
  4. Depression
  5. Sexually transmitted infections; inappropriate (premature) sexual knowledge
- B Report suspicions of child and elder abuse to the appropriate governmental agency, which is a requirement for nursing licensure in most states; the nurse does not need to be absolutely certain and provide proof, there only needs to be a reasonable suspicion
- C Implement nursing care
  1. Interventions for elder and child abuse include education about usual growth and development, methods of discipline of children, referral to support groups and social services, anger management, assertiveness training, and relaxation therapy
  2. Removal of at-risk children; dependent adults may be removed from the home for their safety
  3. Victims of partner abuse usually require several attempts before successfully leaving an abusive situation; victims should be helped to develop strategies for exiting an abusive situation, which include identifying financial resources, safe houses, and

support groups; nurses should guard against expressing frustration to victims who choose to remain in their current situations

## Anger Management

### Overview

A A form of therapy that focuses on clients with a history of hostile/aggressive behavior  
B Teaches clients to assume responsibility for hostile actions, identify anger triggers, and learn new methods of responding

### *Nursing Care Associated with Anger Management Therapy*

A Teach clients enhanced communication skills  
B Teach clients relaxation techniques  
C Encourage cognitive therapy strategies to redefine anger triggers and responses

## Assertiveness Training

### Overview

A Clients learn the differences among aggressive, nonassertive, passive-aggressive, and assertive communication and behavior  
B Techniques include role playing, cognitive restructuring, and fogging/clouding (concur with another's statement without being defensive or agreeing to change)

### *Nursing Care Associated with Assertiveness Training*

A Teach differences among aggressive, nonassertive, passive-aggressive, and assertive communication and behavior  
B Role model assertive communication and behavior  
C Provide positive reinforcement for assertive communication and behavior

## Rape Counseling

### Overview

A Rape counseling is a form of therapy directed to victims of sexual assault; sexual assault occurs when there is lack of consent regarding the event; minors and people with cognitive impairments are regarded as being unable to give consent; sexual activity between a minor or a cognitively impaired adult and a competent adult is a form of sexual assault; rape is an assault, the use of power to overwhelm someone  
B Sexual assaults may include actions such as fondling or indecent exposure  
C Although most victims of rape are women, men also can be victims of rape  
D Myths such as the woman must have done something to provoke the rape often keep women from reporting rapes  
E The acute reaction to rape is often shock, disbelief, and dissociation from the event

F Somatic problems, sleep disorders, phobias, social withdrawal, and depression may occur as later responses, especially if therapy is not sought and received

### ***Nursing Care of Clients Who Have Experienced Sexual Assault***

A Treat physical injuries, protect against sexually transmitted infections, offer pregnancy prevention and emotional support

B Create a safe environment in which the victim may express feelings and regain some sense of choice and control

C Provide support to family and friends of the victim and direct them how to support the victim appropriately

D Refer to rape counselors and/or rape counseling centers for immediate help and for longer-term support

E Focus on providing physical care and emotional support; assist with gathering evidence for criminal prosecution if needed

# Nursing Care in Relation to Therapeutic Modalities

## Group Therapy

### Overview

A Group therapy uses the dynamics of the group to achieve results less likely to occur in a one-to-one nurse-client relationship (e.g., decreasing sense of isolation, instilling hope through example of others, providing opportunities to help others)

B Group process describes how the group is functioning; group content describes what topics or tasks are addressed

C Groups can be effective or ineffective (see [Table 16-4: Comparison of Group Effectiveness](#))

**Table 16-4**  
**Comparison of Group Effectiveness**

Factor	Effective Group	Ineffective Group
Atmosphere	Relaxed and interested	Tense and bored
Goal setting	Clearly defined and accepted Modified as needed	Vague and not supported
Goal emphasis	Process and task functions balanced	Tasks and process needs are not balanced
Cohesiveness	Built through trust and mutual support	Too close and overcontrolling or limited connection among members
Conflict	Accept differences Work to resolve conflicts	Avoid facing conflicts or unresolved ongoing conflicts
Power	Shared Determined by ability	Based on position only
Leadership	Based on needs and ability Delegates appropriately	Overcontrolling or weak
Communication	Open and two-way	Closed and one-way Dominated by a few members
Decision making	Consensus when appropriate	From leader down with little input from members
Problem solving	Encourage constructive criticism	Limited by inflexibility
Creativity	Open to new ideas	New ideas discouraged
Self-evaluation	Open to all members Frequently performed	Performed by only a few members infrequently

### Nursing Care Associated with Group Therapy

A Select clients suitable for the group (level of attention and communication skills)

B Orient group members to the group process

C Maintain individual member's psychologic and physical safety

D Facilitate group process when necessary

E Assist the group to achieve therapeutic goals by encouraging member participation; all communication has value

## Therapeutic Milieu

### Overview

A Therapeutic milieu is the provision of an environment that consistently encourages the highest level of functioning of clients

- B The environment supports client independence and responsibility, as well as improves social interactions (e.g., daily schedule of activities, communal dining, wearing street clothes) while maintaining safety
- C Clients and health team members interact and work together to improve clients' functions

### ***Nursing Care Associated with Maintaining a Therapeutic Milieu***

- A Develop and maintain a schedule of unit activities
- B Encourage client independence in daily activities as appropriate
- C Provide opportunities for healthy socialization
- D Maintain client safety by increasing supervision and removing dangerous objects

## **Relaxation Therapy**

### ***Overview***

- A Promotion of relaxation through meditation, progressive relaxation, deep breathing, guided imagery, and biofeedback
- B Integration of many types of treatment for clients who need to develop healthier methods for coping with stress

### ***Nursing Care Associated with Relaxation Therapy***

- A Teach and reinforce relaxation techniques
- B Lead relaxation groups

## **Family Therapy**

### ***Overview***

- A Derived from systems theory and group therapy
- B The guiding principle is that treating the individual in isolation from the family allows dysfunctional interpersonal patterns to continue once the client returns to the family environment, which often undermines progress made in individual therapy
- C Many of the problems identified in an individual may in actuality be responses to dysfunctional family interactions
- D This therapy may be used for a variety of clients and may be the best type of intervention for domestic violence

## **Related Pharmacology: Psychotropic Medications**

### ***Overview***

- A Chemicals produce profound effects on the mind, emotions, and body
- B Within one decade (the 1950s) three major classes of psychotropic drugs—antimanic, antipsychotic, and antidepressant—were developed

- C These compounds significantly advanced the treatment of bipolar illness, psychoses, and depression
- D The decrease in state hospital census has been attributed to the introduction of psychotropic drugs
- E Psychotropic drugs include antianxiety or anxiolytic agents; antipsychotic or neuroleptic agents; antidepressants, antimanic, and mood-stabilizing agents; and sedative and hypnotic agents
- F The safety of psychotropic drugs during pregnancy is of concern; consultations with a health care provider and a pharmacist before administration is advised
- G Response to psychotropic medications, both therapeutic and side effects, varies greatly from person to person
- H The goal of psychopharmacology is to administer the medication and dosage that will maximize therapeutic effects and minimize side effects
- I Medication is only one component of treatment; used to increase clients' abilities to engage in other forms of therapy
- J Relapse in clients with psychiatric problems most often is related to failure to adhere to the medication regimen

## ***Antianxiety/Anxiolytic Medications***

### **Description**

- A Used in the treatment of acute anxiety, for alcohol withdrawal, and in the induction of sleep
- B Exert a general depressing effect on the central nervous system (CNS); many also exert skeletal muscle-relaxant and anticonvulsant effects
- C Available in oral and parenteral (intramuscular [IM], IV) preparations
- D Intended for short-term use when the individual has difficulty in coping with environmental stresses and accomplishing daily activities
- E Benzodiazepines: enhance the gamma-aminobutyric acid (GABA) activity (the primary inhibitory neurotransmitter in the brain), resulting in further opening of the chloride ion channel and a further inhibition of neuronal activity; a decrease in the firing rate of neurons results in lowering of anxiety

### **Types**

#### **A Benzodiazepines**

- 1. Short-acting
  - a. Alprazolam (Xanax)
  - b. Midazolam
  - c. Oxazepam
  - d. Triazolam (Halcion)
- 2. Medium-acting
  - a. Lorazepam (Ativan)

b. Temazepam (Restoril)

3. Long-acting

a. Chlordiazepoxide (Librium)

b. Clonazepam (Klonopin)

c. Clorazepate (Tranxene)

d. Diazepam (Valium)

e. Flurazepam (Dalmane)

B Nonbenzodiazepines

1. BusPIRone (BuSpar)

2. DiphenhydrAMINE (Benadryl)

3. Eszopiclone (Lunesta)

4. Hydroxyzine (Vistaril)

5. Ramelteon (Rozerem)

6. Zaleplon (Sonata)

7. Zolpidem (Ambien)

C Antidepressants indicated for anxiety

1. ClomiPRAMINE (Anafranil)

2. Fluoxetine (Prozac)

3. Fluvoxamine (Luvox)

4. Paroxetine (Paxil)

5. Sertraline (Zoloft)

6. Venlafaxine (Effexor XR)

## Precautions

A Drug interactions: these drugs potentiate depressant effects of alcohol or sedatives

B Adverse effects: related to diminished mental alertness; caution about driving or operating hazardous machinery until tolerance develops; Asians and Eskimos at greater risk for toxic levels

C Tolerance to the sedative and hypnotic effects develops eventually with all these drugs, although it develops more slowly with the benzodiazepines than other drugs; tolerance can contribute to self-medication and dosage escalation

D Can lead to physical and emotional dependence if taken in large enough doses or for extended time periods

E A drop in blood pressure (BP) of 20 mm Hg (systolic) on standing warrants withholding the drug and notifying the health care provider

F Physical withdrawal symptoms can occur any time these drugs are stopped after being taken continuously for more than 2 weeks; signs and symptoms closely resemble the original sleep or anxiety problems

G Caffeine can worsen symptoms of anxiety; it is thought to interfere with medications used to treat these disorders

H Benzodiazepines

1. Should not be discontinued abruptly to avoid a withdrawal syndrome

2. Should be discontinued if the client is receiving electroconvulsive therapy (ECT)

3. Because tolerance and dependency may develop with long term use, chronic anxiety disorders are usually treated with antidepressant medications
  4. Overdose necessitates administration of flumazenil (Romazicon) to counter adverse effects
- I BusPIRone (BuSpar)
1. Potent antianxiety agent with no identified addictive potential
  2. Not effective in the management of drug or alcohol abuse
  3. Therapeutic effects are not apparent for 3 to 6 weeks; this is a much longer lag time than other drugs in this category

## ***Nursing Care of Clients Receiving Antianxiety/Anxiolytic Medications***

- A Assess the client's medication history, knowledge level, and use of current medications (e.g., prescribed, over-the-counter (OTC), and illicit drugs), medication allergies, and pattern of alcohol, tobacco, and herbal use because all may interfere with the action of anxiolytics
- B Explore the client's perceptions and feelings about medications; clarify misinformation and concerns
- C Monitor the effects of medication (e.g., effects on target symptoms, side effects, and adverse reactions)
- D Administer medications exactly as prescribed and in accordance with schedule restrictions
- E Teach the client about the medication; desired effect; side effects; food, herbal, and activity restrictions; and lag period between onset of treatment and symptom remission
- F Provide education regarding benzodiazepines
1. OTC drugs such as antihistamines may increase potency
  2. Driving or working with machinery should be avoided while sedative side effects are present
  3. CNS depressants and alcohol potentiate effects
  4. Drugs should not be discontinued abruptly
  5. If prior assessment reveals use of herbal or related products (St. John's wort, kava, ginseng, etc.), consult with health care provider and pharmacist
- G Supplement verbal teaching with appropriate written or audiovisual materials
- H Evaluate client's response to medications and understanding of teaching
- I Encourage client involvement in therapy to decrease stressors and improve coping to limit long-term need for antianxiety medication

## ***Antipsychotic Agents***

### **Description**

- A Used to treat agitated and aggressive behavior and psychotic symptoms (e.g., out of touch with reality); makes client better able to participate in therapy
- B Act by blocking dopamine receptors in the CNS; they also block the muscarinic

receptors for acetylcholine and the alpha receptors for norepinephrine

1. Positive (type I) symptoms of schizophrenia (e.g., hallucinations, delusions) respond to traditional and newer antipsychotic drugs
  2. Negative (type II) symptoms (e.g., apathy, flat affect) are more responsive to the newer atypical antipsychotic drugs
- C Available in oral and parenteral (IM, IV) preparations
- D Effective in treating symptoms of psychosis noted in schizophrenia, schizoaffective disorder, and delusional disorder
- E May be prescribed in conjunction with benzodiazepines, which is thought to minimize the dose of antipsychotics and diminish the potential for tardive dyskinesia
- F May be prescribed at the onset of mania for sedative effects until therapeutic levels of antimanic medication is achieved
- G Antipsychotic effects usually occur within 1 to 2 weeks after initiating treatment, but sedative effect can be immediate

## Types

A Traditional drugs (first-generation drugs)—phenothiazines

1. ChlorproMAZINE
2. Thioridazine
3. Fluphenazine
4. Perphenazine
5. Prochlorperazine
6. Trifluoperazine

B Traditional drugs (first-generation drugs)—nonphenothiazines

1. Haloperidol (Haldol)
2. Thiothixene (Navane)
3. Loxapine (Loxitane)
4. Pimozide (Orap)

C Atypical drugs (second-generation drugs)

1. Aripiprazole (Abilify)
2. Clozapine (Clozaril)
3. Olanzapine (Zyprexa, Zydis)
4. Quetiapine (Seroquel)
5. Risperidone (Risperdal)
6. Ziprasidone (Geodon)

## Precautions

A Drug interactions

1. Potentiate the action of alcohol, barbiturates, antihypertensives, and anticholinergics; concomitant use should be avoided if possible
2. Should be temporarily discontinued when spinal or epidural anesthesia is necessary

B Adverse effects

1. Agranulocytosis (may be manifested by signs and symptoms of a cold or sore throat)
2. Jaundice (hepatotoxicity)
3. Drowsiness (highest incidence in initial days of therapy because of CNS depression)
4. Orthostatic hypotension (autonomic nervous system [ANS] depression)
5. Anticholinergic side effects: dry mouth, blurred vision, constipation and urinary retention
6. Anorexia (depressed appetite center)
7. Hypersensitivity reactions: tissue fluid accumulation, visual changes, impotence, cessation of menses or ovulation
8. Cardiac toxicity (direct toxic effect)
9. Weight gain and metabolic syndrome (abdominal obesity, dyslipidemia, hypertension, and insulin resistance leading to diabetes)
10. Photosensitivity
11. Extrapyramidal side effects (EPS)
  - a. Dystonia: occurs early in treatment, possibly after initial dose; involves grimacing, torticollis, intermittent muscle spasms
  - b. Pseudoparkinsonism: resembles true parkinsonism (tremor, masklike facies, drooling, restlessness, shuffling stooped gait, rigidity)
  - c. Akathisia: motor agitation (restless legs, "jitters," nervous energy); most common of all EPS
  - d. Akinesia: fatigue, weakness (hypotonia), painful muscles, lack of energy (anergia)
  - e. Tardive dyskinesia: late-appearing after prolonged use of antipsychotic drugs; not related to dopamine-acetylcholine imbalance; most severe effect characterized by involuntary movements of face, jaw, and tongue; lip smacking, grinding of teeth, rolling or protrusion of tongue, tics, diaphragmatic movements that may impair breathing; condition disappears during sleep; antiparkinsonian drugs ineffective and condition is usually irreversible; all antipsychotics should be discontinued to determine if symptoms subside
12. Neuroleptic malignant syndrome: infrequent yet extreme life-threatening condition occurring in severely ill clients and is thought to be the result of dopamine blockage in the hypothalamus; associated with high-potency antipsychotic drugs, especially when given in a large loading dose; symptoms are hyperthermia (cardinal symptom), muscular rigidity, tremors, impaired ventilation, muteness, altered consciousness, unstable BP, and autonomic hyperactivity

C Antiparkinsonian drugs are given to block the EPS that are related to dopamine and acetylcholine imbalance

1. Anticholinergics are most used for EPS: benztropine (Cogentin), biperiden (Akineton), trihexyphenidyl; a missed dose should be taken up to 2 hours before next dose; tend to worsen some anticholinergic effects of the antipsychotics
2. Antihistamine: diphenhydramine (Benadryl)
3. Others
  - a. Used for neuroleptic malignant syndrome: amantadine, bromocriptine (Parlodel),

dantrilene (Dantrium)

- b. Used for akinesia and akathisia: lorazepam (Ativan) diazepam (Valium),  
clonazepam (Klonopin)

## ***Nursing Care of Clients Receiving Antipsychotic Agents***

A Monitor BP

1. Assess in both supine and standing positions
2. Assess before each dose is administered
3. Assess for tachycardia, which usually is a response to hypotension
4. Consult health care provider as to safe systolic/diastolic parameters for each client
5. Maintain safety if hypotension occurs (e.g., assist with ambulation, assist client to rise from bed slowly and sit on bed before ambulating, keep side rails up when nonambulatory)

B Use precautions to avoid drug contact with skin; can cause contact dermatitis

C Assess for EPS; antiparkinsonism agent may be prescribed to decrease symptoms

D Monitor laboratory results during long-term therapy (e.g., periodic complete blood counts (CBCs), liver function tests, lipid profiles, glucose tolerance, blood glucose levels, and chemistry analysis; weekly white blood cell (WBC) count if administering clozapine [Clozaril])

E Monitor for signs of hepatic toxicity (e.g., jaundice)

F Monitor for signs of infection (e.g., sore throat)

G Monitor dietary intake to avoid weight loss resulting from caloric expenditure caused by EPS

H Monitor for weight gain associated with metabolic syndrome

I Instruct client to

1. Avoid administration with other CNS depressants, including concurrent use of alcohol
  2. Avoid engaging in potentially hazardous activities
  3. Avoid exposure to direct sunlight; wear protective clothing and sunglasses outdoors
  4. Recognize signs and symptoms of EPS and report their occurrence immediately
  5. Avoid changing positions rapidly
  6. Notify health care provider if sore throat, fever, or weakness occur; avoid crowded, potentially infectious places
  7. Use sugar-free chewing gum or hard candy to increase salivation and relieve dry mouth
  8. Increase water intake and eat high-fiber diet to avoid constipation
  9. Expect weight gain; control weight with appropriate diet
  10. Avoid mixing with certain juices or liquids (e.g., coffee, tea, or cola beverages), which may decrease effectiveness of drug
  11. Avoid antacids or take them 1 to 2 hours after antipsychotic drug is taken because antacids decrease absorption of antipsychotics
  12. Eliminate or minimize smoking because it decreases serum levels of antipsychotics
- J Recognize that nonadherence to drug regimen is common; monitor clients during administration to ensure medication is taken to prevent “cheeking” (client may discard tablet or save tablets to attempt overdose); consult health care provider about use of

longer-acting drugs such as fluphenazine (Prolixin), haloperidol (Haldol), or risperidone (Risperdal); liquid forms of medications; or rapidly dissolving tablets such as olanzapine (Zyprexa, Zydis)

K Evaluate client's response to medication and understanding of teaching

## **Antidepressants**

### **Description**

A Primarily used for major depressive illness; also used in the treatment of panic disorder, other anxiety disorders, posttraumatic stress disorder, narcolepsy, attention deficit disorders, and enuresis in children

B Treatment is based on the restoration of acceptable levels of neurotransmitter systems by blocking the uptake in the presynaptic nerve ending, inhibiting breakdown, stimulating the release, and reducing stimulation at the site of the postsynaptic beta receptors (i.e., down-regulation)

C Affect the neurotransmitters norepinephrine and/or serotonin by partially blocking their reuptake; roles for other neurotransmitters are unclear and under study

D Available in oral and parenteral (IM) preparations

E May need to be taken for 1 to 4 weeks before therapeutic response occurs; side effects may occur with initial doses

F BuPROPion (Wellbutrin), an atypical antidepressant, also is used as an adjunctive treatment for smoking cessation

G Selective serotonin reuptake inhibitors, with their low side effect profile, are being used to treat eating disorders and obsessive-compulsive disorder

H Monoamine oxidase inhibitors (MAOIs) elevate norepinephrine levels in brain tissues by interfering with the enzyme MAO; act as psychic energizers; rarely used because of serious drug and food interactions that cause hypertensive crisis

### **Types**

A Tricyclic drugs (TCAs) or nonselective cyclic drugs

1. Clomipramine (Anafranil)
2. Desipramine (Norpramin)
3. Doxepin (Silenor)
4. Imipramine (Tofranil)
5. Nortriptyline (Aventyl, Pamelor)
6. Protriptyline (Vivactil, Triptil)
7. Trimipramine (Surmontil)

B Monoamine oxidase inhibitors (MAOIs)

1. Isocarboxazid (Marplan)
2. Phenelzine sulfate (Nardil)
3. Selegiline (Eldepryl, Emsam)
4. Tranylcypromine sulfate (Parnate)

## C Selective serotonin reuptake inhibitors (SSRIs)

1. Citalopram (Celexa)
2. Fluoxetine (Prozac, Prozac Weekly, Sarafem)
3. Fluvoxamine (Luvox)
4. Escitalopram (Lexapro)
5. Paroxetine (Paxil)
6. Sertraline (Zoloft)

## D Atypical new generation drugs

1. BuPROpion (Wellbutrin, Wellbutrin SR, Zyban)
2. Mirtazapine (Remeron)
3. Trazodone (Oleptro)
4. Venlafaxine (Effexor, Effexor XR)

## E Serotonin-norepinephrine reuptake inhibitors (SNRIs)

1. Desvenlafaxine (Pristiq)
2. Duloxetine (Cymbalta)

## Precautions

### A Tricyclic antidepressants (TCAs)

1. Drug interactions: potentiate effects of anticholinergic drugs and CNS depressants (e.g., alcohol and sedatives)
2. Adverse effects
  - a. Orthostatic hypotension, skin rash, drowsiness, dry mouth, blurred vision, constipation, urine retention, and tachycardia
  - b. CNS stimulation in older adults (e.g., excitement, restlessness, incoordination, fine tremor, nightmares, delusions, disorientation, insomnia)
3. Should not be prescribed for clients with narrow-angle glaucoma
4. Contraindicated during recovery phase of myocardial infarction or when client's history indicates cardiac dysrhythmias and cardiac conduction defects
5. Should not be administered concurrently with MAOIs to prevent hypertensive crisis; there should be a minimum of 14 days between switching the TCA-resistant client to an MAOI
6. Abrupt discontinuation of TCAs can cause nausea, headache, and malaise

### B Monoamine oxidase inhibitors (MAOIs)

1. Drug interactions: MAOIs potentiate the effects of alcohol, barbiturates, anesthetic agents, cocaine, antihistamines, narcotics, corticoids, anticholinergics, and sympathomimetic drugs
2. Drug-food interactions: hypertensive crisis with vascular rupture, occipital headache, palpitations, stiffness of neck muscles, emesis, sweating, photophobia, and cardiac dysrhythmias may occur when neurohormonal levels are elevated by ingestion of foods with high tyramine content (e.g., pickled herring, beer, wine, chicken livers, aged or natural cheese, chocolate, caffeine, cola, licorice, avocados, bananas, and bologna); processed cheeses and fresh cheese (e.g., cottage cheese) are low in tyramine
3. Adverse effects

- a. Orthostatic hypotension (CNS effect)
- b. Skin rash (hypersensitivity)
- c. Drowsiness (CNS depression)
- d. Dry mouth, blurred vision, urinary retention, tachycardia (anticholinergic effect)
- e. Sexual dysfunction (autonomic effect)
- f. Nightmares, delusions, disorientation, insomnia (CNS stimulation)

C Selective serotonin reuptake inhibitors (SSRIs) and serotonin-norepinephrine reuptake inhibitors (SNRIs)

1. Drug interactions: may interact with tryptophan, diazepam, warfarin, and digoxin; should be discontinued 4 to 6 weeks before switching to an MAOI
2. Adverse effects: insomnia, headache, dry mouth, sexual dysfunction, anxiety, diarrhea and other GI complaints
3. Serotonin syndrome: confusion, coma, agitation, tachycardia, BP changes, nausea, myoclonus, hyperreflexia, tremors, ataxia, hyperpyrexia; usually resolves with elimination of SSRIs and supportive care
4. Usually these drugs are administered before noon to avoid insomnia or sleep disturbances

D Atypical new-generation drugs

1. Adverse effects: increased appetite, weight gain, and sleep disturbances; mild anticholinergic side effects noted
2. Bupropion (Wellbutrin) is thought to affect dopamine reuptake and agitation is sometimes produced

## ***Nursing Care of Clients Receiving Antidepressants***

A Monitor for self-destructive behavior, particularly during the second week of drug therapy when suicidal ideation remains and energy increases; maintain suicide precautions

B Monitor serum glucose levels in clients with diabetes mellitus

C Instruct client to

1. Change positions slowly
2. Avoid engaging in hazardous activities
3. Use sugar-free chewing gum or hard candy to stimulate salivation
4. Check with the health care provider before taking all OTC preparations, alcohol, and cough or herbal medicines (e.g., St. John's wort)
5. Expect therapeutic effect to be delayed; may take up to 3 weeks with MAOIs and 2 to 4 weeks with other antidepressants

D Avoid concurrent administration of adrenergic drugs; limit or eliminate caffeine use to prevent exacerbation of depression

E MAOIs

1. Maintain dietary restrictions; avoid foods containing tyramine; provide for nutritional education
2. Monitor client for signs and symptoms of hypertensive crisis (e.g., occipital headache, palpitations, and stiff neck); treat with NIFEdipine (Procardia) and phentolamine

(Regitine)

F Recommend fluoxetine (Prozac), weekly capsule (90 mg), to treat clients who do not adhere to the drug regimen

G Evaluate client's response to medication and understanding of teaching

## ***Antimanic and Mood-Stabilizing Agents***

### **Description**

A Used to control the manic episode of mood disorders and for maintenance in clients with a history of mania

B Improves productivity by decreasing psychomotor activity or response to environmental stimuli

C Available in oral capsules and tablets, both regular and sustained-release forms, and in concentrates

D Lithium affects the neurotransmitters of multiple systems including dopamine, norepinephrine, serotonin, acetylcholine, and GABA

### **Types**

A Antimanic agents and mood stabilizers

1. Lithium carbonate
2. Lithium carbonate sustained release (Lithobid)
3. Lithium citrate concentrate (Cibalith)

B Alternative antimanic agents and mood stabilizers

1. Carbamazepine (Tegretol)
2. Gabapentin (Neurontin)
3. Lamotrigine (Lamictal)
4. Topiramate (Topamax)
5. Valproates (Depakene, Depakote, Depakote ER, Depacon)

C Some antipsychotic agents such as aripiprazole (Abilify) and ziprasidone (Geodon) may be used during the acute manic phase of bipolar illness to assist with symptom control until therapeutic levels of other antimanic medications are achieved

### **Precautions**

A Drug interactions: diuretics increase the reabsorption of lithium, resulting in possible toxic effects; when given with haloperidol (Haldol) encephalopathic syndrome can occur; sodium bicarbonate or sodium chloride increases the excretion of lithium

B Drug-food interaction: restriction of sodium intake increases drug substitution for sodium ions, which causes signs of hyponatremia (e.g., nausea, vomiting, diarrhea, muscle fasciculations, stupor, seizures); daily intake of more than 250 mg of caffeine with lithium decreases effect of antianxiety drugs

C Adverse effects: headache, drowsiness, dizziness, dry mouth, anorexia, nausea, hypotension, edema

D Toxic effects: vomiting, diarrhea, tremors, weakness, lassitude, severe thirst, tinnitus, dilute urine; drug blood levels above 1.5 mEq/L indicate toxicity; toxicity easily occurs because the difference between the therapeutic level and toxic level is slight

E One to 2 weeks of treatment is necessary to achieve a clinical response; antipsychotic agents or benzodiazepines may be used in combination with lithium to control manic symptoms initially until antimanic clinical response occurs

## ***Nursing Care of Clients Receiving Antimanic and Mood-Stabilizing Agents***

- A Recognize that therapeutic effects will be delayed for several weeks
- B Check concurrent medications for potential interactions
- C Administer with meals to reduce gastrointestinal (GI) irritation; ensure that drug is not crushed or chewed; liquid forms are available
- D Encourage avoidance of hazardous activities
- E Teach that medication should not be discontinued abruptly and that if it is discontinued, it should be done with medical supervision
- F Provide nursing care specific to lithium
1. Maintain sodium and adequate fluid intake because dehydration and hyponatremia predispose to lithium toxicity
  2. Monitor weight and for signs of dependent edema
  3. Assess therapeutic blood levels (0.5 to 1.5 mEq/L) weekly for 1 month and then at 2- to 3-month intervals
  4. Teach about signs and symptoms of side effects and toxicity
  5. Refer pregnant woman to health care provider; cessation of lithium during pregnancy is recommended to avoid teratogenic effects during first trimester
- G Provide nursing care specific to valproates
1. Administer elixir alone; do not dilute with carbonated beverages
  2. Teach about side effects: sedation, drowsiness, nausea, vomiting, diarrhea, constipation, heartburn
  3. Teach about signs of toxicity: visual disturbances, rash, diarrhea, light-colored stools, jaundice, protracted vomiting
- H Evaluate client's response to medication, including CBC results
- I Evaluate client's understanding of self care related to the medication regimen

## ***Sedative and Hypnotic Agents***

### **Description**

- A Benzodiazepines have almost entirely replaced barbiturates in the treatment of anxiety and sleep disorders; sedative and hypnotic agents are primarily used in general medicine rather than psychiatry
- B Sedative-hypnotic preparations are generally intended for either occasional or short-term use
- C Insomnia, hypersomnia, narcolepsy, parasomnias, periodic leg movements (nocturnal

myoclonus), and sleep apnea are among the disorders that are responsive to these agents; specific psychiatric conditions predispose clients to insomnia (mood disorders, anxiety, and dementias)

D CNS depressants have antianxiety effects in low dosages, produce sleep in high dosages, and have general anesthetic-like states in very high dosages

E Sedatives reduce nervousness, excitability, and irritability without inducing sleep, but a sedative can become a hypnotic in large doses

F All hypnotic drugs probably alter either the character or the duration of rapid eye movement (REM) sleep

G Hypnotics cause sleep and have a more potent effect on the CNS than sedatives

H Sedative-hypnotics are classified chemically into three groups: barbiturates, benzodiazepines, and nonbenzodiazepines

## Types

A Barbiturates: pentobarbital (Nembutal)

B Benzodiazepines: see [Antianxiety/Anxiolytic Medications](#)

C Nonbenzodiazepine hypnotics: see [Antianxiety/Anxiolytic Medications](#)

D Antidepressant: trazodone (Oleptro)

E Antihistamines: diphenhydramine (Benadryl); hydroxyzine (Vistaril)

F Beta-adrenergic blocker: propranolol (Inderal)

G Anxiolytic: buspirone (BuSpar)

## Precautions

A The sedative-hypnotics are CNS depressants

B Adverse effects:

1. Hypnotic drugs have undesirable effects (e.g., physiologic addiction, fatal overdose potential, and dangerous interactions with other drugs and alcohol)
2. Barbiturate sedatives increase the metabolism of anticoagulants because they induce liver enzyme synthesis

C Tolerance develops to sedative and hypnotic agents; therefore, the client in the outpatient setting may resort to increasing doses to produce the desired effect

D Physical and emotional dependence occurs if taken in large dosages or for a long time period. Once physical dependence develops, abrupt discontinuation of sedative-hypnotics leads to withdrawal

E Once physical dependence develops, abrupt discontinuation of sedative-hypnotics leads to withdrawal

1. Withdrawal characteristics: insomnia, weakness, muscle tremors, anxiety, irritability, sweating, anorexia, fever, nausea and vomiting, headache, incoordination, and restlessness
2. After several days, severe symptoms of withdrawal may develop: postural hypotension, tinnitus, incoherence, delirium, psychosis, seizures, status epilepticus, cardiovascular collapse, loss of temperature regulation, and/or death

F To avoid severe withdrawal that could result in death, it is important to slowly and gradually taper the dose with the same drug or one that is cross-tolerant

G Treatment for overdose: removal of the drug from the stomach by aspiration, resuscitative measures (e.g., assisted ventilation, cardiac massage), hemodialysis of diffusible drug, vasopressor administration to counteract vascular collapse, and correction of acidosis

H Follow-up drug supervision is needed to avoid repetition of the problem

I Psychotherapy may be required for depressed clients

J Refer to Precautions under Antianxiety/Anxiolytic Medications for additional information

## ***Nursing Care of Clients Receiving Sedative and Hypnotic Agents***

A Assess for history of drug or alcohol abuse or suicide attempts by overdose because of the increased risk for abuse

B Assess for pregnancy and breastfeeding, because safe use has not been established

C Explore the client's perceptions and feelings about medications; clarify any misinformation and concerns

D Plan for client teaching about specific sedative-hypnotic agents; institute safety precautions

E Supplement verbal teaching with appropriate written or audiovisual materials

F Administer controlled substances according to schedule restrictions

G Evaluate client's response to medication and understanding of teaching

H Assess for undesired effects (e.g., respiratory depression, increased sedation, and hypotension)

I Review methods to improve sleep (e.g., minimizing daytime napping, increasing physical activity except just before bedtime, eliminating caffeine intake after dinner, establishing bedtime routines, maintaining a regular sleep schedule)

J Refer to Nursing Care of Clients Receiving Antianxiety/Anxiolytic Medications

## ***Anti-Alzheimer Agents***

### **Description**

A Temporary improvement in cognitive function but progression of disease continues

B Cholinesterase inhibitors: impedes cholinesterase in the CNS thereby increasing acetylcholine

1. Used to treat mild to moderate Alzheimer disease
2. Unlabeled use includes vascular dementia

C N-methyl-d-aspartate (NMDA) receptor antagonist: impedes action of CNS NMDA receptors, thereby lowering the glutamate level in the brain; protects CNS neurons

1. Used to treat moderate to severe Alzheimer disease
2. Unlabeled use includes vascular dementia

## Types

A Cholinesterase inhibitors

1. Donepezil (Aricept)
2. Rivastigmine (Exelon)
3. Galantamine (Razadyne)

B NMDA receptor antagonist

1. Memantine (Namenda)

## Precautions

A Cholinesterase inhibitors

1. Drug interactions: synergistic effect with other cholinesterase inhibitors; donepezil (Aricept) should not be administered within 2 weeks of MAOIs because hypertensive crisis may occur
2. Adverse effects: GI disturbances (e.g., nausea, vomiting, diarrhea), headache, insomnia, dizziness

B NMDA receptor antagonist

1. Drug interactions: alter effects of both NMDA and other medication; hydrochlorothiazide (HCTZ), H<sub>2</sub>-histamine antagonists (e.g., cimetidine [Tagamet], ranitidine [Zantac])
2. Adverse effects: dizziness, confusion, headache, vomiting, constipation

## ***Nursing Care of Clients Receiving Anti-Alzheimer Agents***

A Administer donepezil between meals; administer rivastigmine and galantamine with meals; administer memantine without regard to meals

B Provide assistance with ambulation during beginning therapy because dizziness may occur

C Assess GI status and for behavioral changes, less confusion, increase in mood

D Assess ability to swallow medication; some are supplied in oral solution, oral disintegrating tablets, transdermal route, extended release product that can be sprinkled on food

## CHAPTER 17

# **Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence**

---

# Overview

A These disorders may be characterized by physical as well as psychologic signs and symptoms and must be distinguished from expected variances in growth and development

B The Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition, Text Revision (DSM-IV-TR) criteria for diagnosis are behavioral manifestations that are not age appropriate, deviate from cultural norms, and create deficits or impairments in adaptive functioning. (In 2013, the DSM-V is expected to be published. Diagnostic categories will change through addition of new diagnoses and deletion or merging of others. This is particularly expected in the area of child and adolescent mental disorders.)

C Psychiatric care of the child or adolescent is a subspecialty within psychiatric nursing. Although there is a wide range of deficits with these disorders, there are fundamental principles that apply

D Care should be based on the child's developmental level and directed toward helping the child grow emotionally. All children, especially these children, require

1. Protection from danger, including impulsive acts and self-destructive behavior
2. Love and acceptance
3. Basic physiologic needs to be met
4. Meaningful trusting relationships
5. Opportunities to explore the environment

E There is increasing awareness of mental illnesses in children and adolescents that were formerly believed to occur only in adults. This includes bipolar disorder, schizophrenia, depression, and posttraumatic stress disorder (PTSD). Manifestations of these illnesses in the younger population may differ from those in adults. Treatments may be modified to meet the developmental level of the child and adolescent.

# General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

## A Assessment/Analysis

1. Attainment or delay of developmental milestones (e.g., motor, language, social, etc.)
2. Parental behavior and attitude (e.g., expectations, acceptance/rejection, encouragement/pressure)
3. Personal and family health history (e.g., vision, hearing, general health, perinatal history, familial disorders)
4. Onset, characteristics, and pattern of speech; ability to communicate with others
5. Level of anxiety, frustration, self-esteem
6. Behavioral manifestations (e.g., ability to perform activities of daily living (ADLs), hyperactivity, distractibility, attention span, impulsiveness, repetitive behaviors, tics, reports of somatic symptoms)
7. Social abilities (e.g., ability to connect with others/environment, aggressiveness, ability to follow directions/rules, respect for others and their belongings)

## B Planning/Implementation

1. Develop a trusting relationship with the child and family
  - a. Be as truthful as possible
  - b. Provide consistent caregivers
  - c. Make explanations as clear as possible and at the appropriate cognitive level
2. Help the child to see self as worthwhile
  - a. Encourage verbalization of feelings
  - b. Accept child and focus on strengths to raise self-esteem
  - c. Foster independence by emphasizing abilities and achievements rather than limitations
  - d. Provide opportunities for the child to experience success and satisfaction
  - e. Use positive reinforcement for child's strengths and abilities
  - f. Teach and role model more adaptive coping behaviors
  - g. Increase sense of empathy through role modeling, role playing, group therapy
  - h. Support and encourage the child's movement toward independence but allow dependency when necessary
3. Establish an environment in which the child can gain or regain a favorable equilibrium
  - a. Set realistic, attainable goals
  - b. Maintain routines based on the child's usual schedule; maintain safety
  - c. Manage hyperactivity and aggressive behaviors: progress from avoiding situations that precipitate unacceptable behavior to monitoring behavior for increasing anxiety, signaling child to use self-control, and finally to placing child in "time out" when appropriate
  - d. Set limits that are as realistic as possible but as firm as necessary, avoiding manipulation
  - e. Provide for consistency, both in approach and in rules/regulations

- f. Use a firm system of rewards and punishments within set limits
- g. Point out reality, but accept the child's views of it
- h. Recognize that the maladaptive behavior has meaning for the child or may be beyond the child's control (e.g., tic disorder)
- i. Plan activities to provide a balance between energy expenditure and quiet time
- j. Introduce new situations gradually; permit child to have a familiar, comforting object
- k. Engage in parallel play to connect with a withdrawn child in a nonthreatening manner

4. Involve family in parenting education and management training

- a. Assist parents to
  - (1) Gain an accurate understanding of their child's strengths and weaknesses
  - (2) Cope with feelings such as guilt, failure, or anger
  - (3) Provide firm and consistent discipline and ignore temper tantrums
- b. Help parents and child to identify triggers to maladaptive behaviors
- c. Involve family in multifamily therapy to work through problems of daily life and to gain new information and more adaptive coping skills
- d. Provide parents with a list of available community resources
- e. Assist family with placement of child when home care can no longer be provided because of changes in child or ability of caregivers

5. Administer prescribed medications

- a. Pervasive developmental disorders: antipsychotics, stimulants
- b. Attention deficit hyperactivity disorder: methylphenidate (Ritalin, Concerta); give after breakfast to ensure dietary intake; a second dose should be administered before 6 PM to limit insomnia
- c. Tic disorders: sedatives, anticonvulsants (antiseizure); prescribed but usually have minimal effect
- d. Enuresis: desmopressin (DDAVP, Stimat); tricyclic antidepressants for children older than 5 years of age
- e. Anxiety disorders: stimulants, antianxiety agents

6. Minimize long-term consequences

- a. Identify and ensure that deficits are treated early
- b. Support attendance at school, therapeutic nursery program, day treatment program, or special education program depending on age and degree of disability
- c. Provide ongoing assistance to promote social and academic success
- d. Provide activities appropriate for age and disorder (e.g., play, games, sports)
- e. Allow child time to verbalize, without completing words or sentences for child; use picture boards; use sign language; avoid nonverbal behavior that implies impatience
- f. Support child and parents receiving treatment
  - (1) Physical therapy
  - (2) Occupational therapy
  - (3) Speech therapy

- (4) Stimulation therapy
- (5) Early intervention programs
- (6) Psychotherapy (e.g., play, group, or individual)

# Major Disorders First Evident in Infancy, Childhood, or Adolescence

## Mental Retardation

See Cognitive Impairment ([Mental Retardation](#)) in [Chapter 31, Nursing Care of Toddlers](#)

## Learning Disorders (LD)

### **Data Base**

A Difficulty processing language, auditory or visual processing disorders, difficulty with calculating numbers (dyscalculia)

B Causative factors: environmental, genetic predisposition, perinatal injury, neurologic dysfunction, and medical conditions

C Behavioral/clinical findings

1. Achievement on individually administered, standardized tests in reading, mathematics, or written expression is substantially below (defined as 2 or more standard deviations between achievement and IQ) that expected for age, schooling, and level of intelligence; LDs must be differentiated from usual variations in academic attainment and from scholastic difficulties resulting from lack of opportunity, inadequate teaching, cultural factors, or impaired vision or hearing
2. Demoralization, low self-esteem, and deficits in social skills may be associated
3. Employment difficulties and social adjustment are noted in adolescence and adulthood

### **Nursing Care of Children with Learning Disorders**

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### **Evaluation/Outcomes**

1. Participates in school and home activities
2. Follows directions
3. Completes tasks
4. Benefits from remediation

## Motor Skills Disorders

### **Data Base**

A Developmental motor and coordination disorders that interfere with academic achievement or ADLs; no specific neurologic disorders are present

B Causative factors: No definitive cause has been identified

C Behavioral/clinical findings: lack of coordination that may continue through

adolescence and adulthood

## ***Nursing Care of Children with Motor Skills Disorders***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Maintains or increases mobility/agility
2. Engages in activities suitable to interests, capabilities, and developmental level

## **Communication Disorders**

### ***Data Base***

A Developmental type: inability to begin or interruption in patterns of speech in the absence of physiologic causes

B Acquired type: impairment in expressive language from a physiologic cause (e.g., brain tumor, brain attack, head trauma); may occur at any age, with sudden onset or presence of faulty speech patterns that are persistent and increased by stress

C Behavioral/clinical findings

1. Two common types
  - a. Cluttering: abnormally rapid, erratic, dysrhythmic speech patterns that make communication very difficult to follow
  - b. Stuttering: frequent repetition of sounds or syllables that impairs speech fluency although child has acceptable laryngeal skills; usually occurring at the beginning of a word or phrase
2. Communication disorders are associated with anxiety, avoidance of social situations, and loss of self-esteem

## ***Nursing Care of Children with Communication Disorders***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Demonstrates a decrease in speech pattern disturbances
2. Demonstrates increased participation in social and public situations

## **Pervasive Developmental Disorders (Including Autistic Disorder and Asperger Disorder)**

### ***Data Base***

A Autism is viewed as a behavioral disorder caused by abnormal brain function,

resulting in an alienation or withdrawal from reality; signs may be evident before 2 years of age but it usually is diagnosed by 3 years of age; prognosis is guarded and depends on a multiplicity of factors

B Asperger disorder is similar to but differs from autism in that it has a later onset and has no delay in cognitive and language development; problems with social relationships become evident when child enters school

C Interference with intellect may be so profound that child appears mentally retarded; turns to inanimate objects and self-centered activity for security

D Puberty can be a crucial stage for showing improvement or further deterioration

E Behavioral/clinical findings

1. Severe and pervasive impairment in reciprocal social interaction (e.g., indifferent or aversion to affection and physical contact)
2. Severe and pervasive impairment of communication skills (verbal: e.g., misuse of pronouns; nonverbal: e.g., lack of eye contact)
3. Exhibits stereotypical behavior, interests, and activities (e.g., adheres to routines and rituals with aversion to minor changes; repetitive motor mannerisms)
4. Disinterest in eating; bizarre, unpredictable, uncontrolled behavior

## ***Nursing Care of Children with Pervasive Developmental Disorders***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Remains safe from injury
2. Decreases inappropriate behavior (e.g., self-destructive behavior)
3. Uses fewer stereotypical/repetitive motor behaviors
4. Increases use of first-person speech

## **Attention Deficit Hyperactivity Disorder (ADHD)**

### ***Data Base***

A Thought to have a neurobiologic basis (e.g., genetic, perinatal stress); sometimes complicated by family dynamics and progressive consequences of related learning problems

B More common in males; often diagnosed as child enters the school system

C Symptoms persist in less severe form into adulthood

D Behavioral/clinical findings

1. Inappropriately inattentive; short attention span; easily distracted; learning disabilities
2. Excessive talking and impulsiveness (e.g., cannot take turns, interrupts)
3. Difficulty organizing tasks and activities; does not complete tasks
4. Squirming and fidgeting; hyperactivity may or may not be present

## ***Nursing Care of Children with Attention Deficit Hyperactivity Disorder***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Participates in home and school activities
2. Completes tasks
3. Follows directions

## **Unspecified Conduct Disorder/Oppositional Defiant Disorder**

### ***Data Base***

A Disregard for society's rules/norms and rights of others

B Disregard and lack of empathy for the feelings of others

C Onset may occur as early as age 5 or 6, but usually is in late childhood or early adolescence; often diagnosed as having an antisocial personality disorder in adulthood

D Behavior is repeated despite rational arguments and consequences; causes significant impairment in social, academic, or work performance

E Behavioral/clinical findings

1. Aggression toward people and animals
2. Unfeeling toward others
3. Destruction of property
4. Deceitfulness or theft
5. Serious violations of rules and laws

## ***Nursing Care of Children with Unspecified Conduct Disorder/Oppositional Defiant Disorder***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Decreases destructive acts
2. Demonstrates increased ability to delay gratification

## **Tic Disorders**

### ***Data Base***

A Causative factors: thought to be an imbalance in neurotransmitters; familial or autosomal-dominant patterns exist in high percentage of tic disorders; more common in males

B Diagnosis based on the duration, variety of tics, and age of onset

C Behavioral/clinical findings

1. Tourette disorder: evidence of multiple motor tics (e.g., involuntary, uncontrolled, multiple, rapid movements of muscles such as eye blinking, twitching, and head shaking that occur in episodes throughout the day) and at least one vocal tic (e.g., involuntary production of sounds such as throat clearing, grunting, barking, or the utterance of socially unacceptable words [coprolalia])
2. Chronic motor or vocal disorder: evidence of single or multiple motor or vocal tics, but not both
3. Transient disorder: evidence of motor and/or vocal tics lasting for at least 1 month, but no more than 12 consecutive months
4. Can be controlled for short duration; not usually present during sleep; increased during times of stress

### ***Nursing Care of Children with Tic Disorders***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Demonstrates a decrease in tic behavior
2. Functions socially despite presence of tic

## **Elimination Disorders**

### ***Data Base***

A Incontinence of feces or urine in inappropriate places

B No identifiable physical problems

C Chronologic age is at least 4 years or equivalent developmental level

D Behavioral/clinical findings

1. Functional encopresis: involuntary or intentional defecation in inappropriate places, including clothing
2. Functional enuresis: involuntary or intentional micturition in inappropriate places, including clothing; nocturnal bedwetting is most frequent; child may or may not be aware of voiding or recall a dream about the act of urinating
3. Avoidance of social situations (e.g., school, play groups) because of loss of self-esteem, anxiety, and/or rejection by peers

### ***Nursing Care of Children with Elimination Disorders***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. Demonstrates a decrease in encopresis or enuresis
2. Exhibits an increase in self-esteem

## **Anxiety Disorders of Infancy, Childhood, or Adolescence**

### ***Data Base***

A Some anxiety is expected in childhood and adolescence because fears and worries are part of development

B Anxiety becomes a problem when there is a failure to move beyond the fears of a particular developmental stage

C Behavior interferes with daily functioning and educational and social achievement

D Behavioral/clinical findings

1. Separation anxiety: excessive anxiety centered on harm befalling self, family, or those to whom child has attachment
  - a. Onset occurs as early as 2 years of age with the peak between 7 to 9 years of age; a mild form is a common/expected developmental response in children younger than 2 years of age
  - b. Refusal to attend activities that require temporary parental separation
  - c. Physical signs and symptoms when separation is anticipated
  - d. Problems with sleeping
2. School phobia: Severe anxiety about attending school
  - a. Overwhelming shyness and insecurity
  - b. Psychophysiologic symptoms used to justify nonattendance
  - c. Anxiety increases in response to attempts to force attendance
  - d. Nonattendance at school has emotional and legal implications
3. Selective mutism: persistent failure to speak in specific social situations
  - a. Social involvement limited to family members or people who are familiar to the child
  - b. Excessive shyness or timidity with strangers
4. Reactive attachment disorder: disturbed or developmentally inappropriate behavior that leads to psychosocial deprivation; begins before age 5
  - a. Failure to initiate or respond to most social interactions
  - b. Difficulty in choice of attachment figures

### ***Nursing Care of Children with Anxiety Disorders of Infancy, Childhood or Adolescence***

(See [General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence](#) for Assessment/Analysis and Planning/Implementation)

### ***Evaluation/Outcomes***

1. States a decrease in anxiety and worry
2. Demonstrates a decrease in physiologic symptoms

3. Develops relationships outside of family members
4. Attends school on a consistent basis

# CHAPTER 18

# Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

---

# Overview

A The primary initial deficit occurs in cognition, although there may be changes in mood and behavior

B Includes disorders associated with

1. Temporary or permanent changes in brain tissue that were formerly classified as organic brain syndrome or organic mental disorders (e.g., delirium, dementia)
2. Persistent disturbances in memory resulting from a medical condition or substance use
3. Psychosis that may be acute and short-term or chronic and debilitating; includes schizophrenia, delusional paranoid, and schizoaffective disorders; brief psychotic and shared psychotic disorders; and psychotic disorders caused by medical conditions or substance use

# **General Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception**

- A Provide a safe, familiar environment, direct supervision as necessary, and a consistent caregiver to foster trust
- B Reorient to time, place, person, and situation (e.g., clocks, calendar, incorporation of statements into ordinary conversation that reorient the client); however, avoid excessive use of reorientation because it may cause anxiety; keep statements short, simple, and concrete and use nonverbal cues
- C Keep involved in reality-based activities and in the home situation as long as possible
- D Allow to assume as much responsibility for self-care as possible
- E Provide a quiet environment but do not understimulate; reduce unfamiliar stimuli; promote relationships
- F Plan care so that the client can be approached when receptive
- G Attempt to follow familiar routines; keep schedule of activities flexible to make use of the client's lability of mood and easy distractibility
- H Provide prompting for completion of activities of daily living (ADLs)
- I Encourage adequate nutritional intake; set limits on hyperorality; monitor intake and output I&O
- J Provide diversional activities including exercises that are enjoyable and realistic
- K Observe for changing physiologic and neurologic signs and symptoms
- L Protect from physical harm to self or others related to confusion, aggression, or fluid and electrolyte imbalance
- M Support and educate family caregivers; maintain nonjudgmental attitude
- N Encourage the responsible others to obtain periodic relief from total care; refer to community agencies that provide homecare helpers or respite care if appropriate
- O Support family's decision to place client in a long-term facility

# Major Disorders Related to Alterations in Cognition and Perception

## Delirium

### Data Base

A Etiologic factors

- 1. Temporary, reversible syndrome from which the client usually recovers after treatment
- 2. Occurs secondary to a physical disorder or drug response
- 3. Clinical manifestations develop over a short period (hours or days), and cognitive impairment fluctuates during a 24-hour period
- 4. Stressors
  - a. Infection
    - (1) Intracranial or nervous system (e.g., meningitis or encephalitis)
    - (2) Systemic (e.g., infection, acute or chronic respiratory disorders)
  - b. Head trauma
  - c. Circulatory disturbances resulting in impairment of blood flow to the brain
  - d. Metabolic disorders: electrolyte imbalances resulting from dehydration, diarrhea, or vomiting; fever; endocrine imbalances
  - e. Ingestion of psychoactive substances, accumulative central nervous system (CNS) effect of prescribed medications or street drugs, or withdrawal syndromes (e.g., alcohol withdrawal delirium)
  - f. Multiple etiologies (e.g., combination of medical condition and substance interaction)

B Behavioral/clinical findings ([Table 18-1: Comparison of Clinical Findings of Delirium and Dementia](#))

**Table 18-1**  
**Comparison of Clinical Findings of Delirium and Dementia**

Delirium	Dementia
Acute onset (hours/days)	Chronic
Rapidly progressive	Insidious
Intense anxiety and irritability	Short attention span
Tremors/hyperreflexia	Recent memory loss; later long-term loss
Insomnia	Impaired new learning
Hyperactivity	Lack of initiative/apathy
Fever and tachycardia	Blunted or labile affect
Hypertension	Loss of judgment
Hallucinations and delusions	Motor disturbances
Seizures	Exaggeration of traits
Death	Lower personal care standards

- 1. Confusion, hallucinations (perception in absence of an external stimulus), illusions (misinterpretation of an actual stimulus), and delusions (fixed false belief)
- 2. Disorientation and confusion as to time, place, person, and situation

3. Memory defects for both recent and remote events and facts
4. Slurring or rapid speech that may occur concurrently with an indistinct pronunciation or use of words
5. Tremors, incoordination, imbalance, and incontinence
6. Physical signs and symptoms such as hyperthermia, tachycardia, and gastrointestinal (GI) changes (e.g., anorexia, nausea, vomiting, diarrhea)
7. Agitation and irritability
8. Insomnia

#### C Therapeutic interventions

1. Reduction of causative agent such as fever or toxins
2. Prevention of further damage
3. Diet high in calories, protein, and vitamins and an increase in fluid intake if not contraindicated by physical status; elimination of caffeine
4. Mild sedatives if necessary

## ***Nursing Care of Clients with Delirium***

### **Assessment/Analysis**

1. History of onset and progression of symptoms from family members
2. Potential causative factors (e.g., illness, medications, substance abuse)
3. Orientation to time, place, person, and situation
4. Occurrence of memory defects
5. Mood swings or behavior associated with delirium
6. State of consciousness
7. Vital signs and physical symptoms

### **Planning/Implementation**

1. See General Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception, Nursing Care of Clients with Dementia, and Nursing Care of Clients with Amnesic Disorders
2. Implement prescribed measures to reduce causative factors
3. Reassure family members that symptoms associated with delirium may subside with treatment
4. Assign a one-to-one caregiver during restless or agitated periods
5. Provide a safe, quiet environment with increased supervision
6. Reorient to time, place, person, and situation
7. Communicate with simple direct statements in calm voice; use nonverbal cues
8. Channel agitation into safe activities

### **Evaluation/Outcomes**

1. Remains free from injury
2. Remains oriented ×4 (time, place, person, and situation) to time, place, person, and

situation

3. Assumes increased responsibility for self-care
4. Maintains a diet high in calories, protein, and vitamins
5. Avoids intake of pharmacologic substance associated with delirium
6. Continues to visit health care provider for treatment and amelioration of underlying cause

## Dementia

### **Data Base**

#### A Etiologic factors

1. Not associated with expected aging processes
2. Dementia of the Alzheimer type and vascular dementia are the two most common causes; death occurs after years of mental and physical decline; Alzheimer disease is the fourth leading cause of death in the United States
3. Stressors
  - a. Anatomic changes in the brain from trauma, tumors, and degeneration of tissue (e.g., atrophy, widening ventricles, senile plaques caused by deposits of amyloid protein, neurofibrillary tangles)
  - b. Infections such as tertiary syphilis and acquired immunodeficiency syndrome (AIDS)
  - c. Circulatory disturbances causing anoxia and permanent brain damage (e.g., cerebral arteriosclerosis, brain attack)
  - d. Nutritional deprivation of brain cells (e.g., pellagra)
  - e. Toxins (e.g., chronic alcohol abuse)
  - f. Decreased level of neurotransmitters, especially acetylcholine
  - g. Chromosomal defects (e.g., Huntington disease)
  - h. Immunologic defects creating prolonged inflammatory response in brain tissue

#### B Behavioral/clinical findings ([Table 18-1: Comparison of Clinical Findings of Delirium and Dementia](#))

1. Dementia has an insidious onset with symptoms following a progressively downhill course
2. Early recognition of cognitive deficits may lead to anger, anxiety, and depression; as cognitive deficits progress and self-awareness declines, symptoms may be replaced by apathy and social withdrawal; anxiety may occur when cognitive abilities are overwhelmed and confusion increases
3. Progression moves from mild forgetfulness for recent events and mild expressive aphasia to inability to perform ADLs and mutism
  - a. Aphasia (language disturbance)
  - b. Apraxia (impaired motor activities)
  - c. Agnosia (inability to recognize familiar objects)
  - d. Amnesia (loss of memory)
  - e. Ataxia (impaired coordination)

- f. Disturbance in planning, organizing, sequencing, and abstracting (executive function)
  - g. Emotional lability or flat affect
  - h. Hallucinations, illusions, and delusions
  - i. Sundowning phenomenon: agitated behaviors of physical aggression between 2 and 9 PM; nighttime sleeplessness and wandering between midnight and 6 AM
4. “4 As” of dementia of the Alzheimer type: amnesia, apraxia, agnosia, aphasia
- C Therapeutic interventions
1. The same as those for delirium with greater emphasis on preventing further damage (see Therapeutic Interventions under [Delirium](#))
  2. Medications for depression, agitation, and cognitive decline
    - a. Antidepressants: may improve overall level of functioning (see [Chapter 16, Related Pharmacology: Psychotropic Medications](#), Antidepressants)
    - b. Antipsychotics: may decrease agitation and aggressive behavior (see [Chapter 16, Related Pharmacology: Psychotropic Medications](#), Antipsychotic Agents)
    - c. Antidementia agents: provide a temporary improvement in cognitive function but progression of disease continues (see [Chapter 16, Related Pharmacology: Psychotropic Medications](#), Anti-Alzheimer Agents)

## ***Nursing Care of Clients with Dementia***

### **Assessment/Analysis**

1. History of onset and progression of symptoms
2. Physical and emotional status in relation to needs associated with nutrition, fluid and electrolyte status, hygiene and toileting capabilities, and safety
3. History of premorbid personality, abilities, and level of functioning
4. History of impaired memory
5. History of hallucinations (often visual) and delusions (often persecution)
6. Identification of caregivers and their ability to provide adequate care
7. Existence of advance directives
8. Screening with the Mini-Mental State Exam (MMSE); assesses orientation (e.g., identifying year, date, location), registration (e.g., repeating names of objects), attention and calculation (e.g., identifying serial numbers, spelling a word backward), recall (e.g., restating words previously said by examiner), language (e.g., naming objects, following a three-stage command, reading and obeying a command); maximum score is 30; score less than 23 is indicative of cognitive impairment

### **Planning/Implementation**

1. See Nursing Care of Clients with Delirium and Nursing Care of Clients with Amnestic Disorders
2. Toilet frequently
3. Assist with feeding

4. Protect from self and environment; modify environment to prevent injury and wandering; increase supervision
5. Support attempts at independence when appropriate
6. Support family's decisions regarding present and future care; encourage completion of advance directives while client has capacity
7. Assess effectiveness of medication to delay progression of cognitive symptoms
8. Support caregivers as necessary (e.g., respite care, home health aides, long-term residence, support groups)

## Evaluation/Outcomes

1. Remains free from injury
2. Maintains maximal potential for as long as possible
3. Family uses community resources as necessary

## Amnestic Disorders

### **Data Base**

#### A Etiologic factors

1. Disturbance in memory related to medical condition (e.g., head trauma, brain attack)
2. Disturbance in memory related to persistent effects of substance (e.g., drug abuse, medication, or toxin exposure)

#### B Behavioral/clinical findings

1. Impaired ability to learn new information
2. Difficulty recalling previously learned information or past events
3. Absence of anxiety related to a traumatic event
4. Impaired social and occupational abilities

#### C Therapeutic interventions: see [Dementia](#)

### **Nursing Care of Clients with Amnestic Disorders**

## Assessment/Analysis

1. History of onset and progression of symptoms
2. History of previous level of functioning
3. Causative agent
4. Physical and emotional status

## Planning/Implementation

1. See Nursing Care of Clients with Substance-Induced Amnestic Disorders, Nursing Care of Clients with Delirium, and Nursing Care of Clients with Dementia
2. Maintain a safe environment
3. Support attempts at independence when appropriate
4. Support client and family regarding present and future care decisions

## Evaluation/Outcomes

1. Demonstrates remission of amnesia
2. Returns to previous level of functioning
3. Family utilizes community resources

## Substance-Induced Amnestic Disorders

### **Data Base**

#### A Etiologic factors

1. Nervous system, particularly the CNS, directly affected by factors such as medications and toxins and their excessive use
2. Vitamin deficiency such as thiamine, especially in long-term alcohol abuse resulting in Korsakoff syndrome
3. Persistent memory disturbance long after drug or toxin exposure has ended

#### B Behavioral/clinical findings

1. Specific neurologic and psychologic signs and maladaptive behavior such as euphoria, dysphoria, apathy, confabulation, psychomotor agitation, excitement or depression, hypervigilance, and violent behavior
2. Dementia or delirium may be present, depending on substance used
3. Physical symptoms such as depressed respirations, cardiac irregularities, and GI changes
4. Significant impairment in social and work activities with a decline in previous level of function
5. Memory disturbances; impairment in ability to recall previously learned information or to learn new information

#### C Therapeutic interventions: see [Delirium](#)

## ***Nursing Care of Clients with Substance-Induced Amnestic Disorders***

### **Assessment/Analysis**

1. History, physical examination, laboratory findings related to drug abuse or toxin exposure
2. History of symptom onset (rapid/slow)
3. Orientation to time, place, person, and situation
4. Ability to have short-term and long-term recall
5. Level of consciousness and stimulation necessary to evoke a response

### **Planning/Implementation**

1. See Planning/Implementation under Nursing Care of Clients with Amnestic Disorders, Nursing Care of Clients with Dementia, and Nursing Care of Clients with Delirium

## Evaluation/Outcomes

1. Abstains from injurious substances
2. Reduces maladaptive behavior
3. Remains free from injury
4. Becomes cognitively stable or slightly improves

## Schizophrenic Disorders

### Data Base

#### A Etiologic factors

1. Foremost etiology is the biologic perspective (e.g., neuroanatomy, genetics, endocrinology, and immunology all produce symptoms; trauma and disease as causation continue to be researched)
2. Biologic components
  - a. Heredity and genetics
  - b. Neuroanatomic differences and neurochemicals (e.g., dopamine hyperactivity or overproduction)
    - (1) Structure and function of nervous system
    - (2) Teratogenic drug exposure
    - (3) Neuroanatomic differences in brain (e.g., enlarged ventricles)
  - c. Neurotransmitter function: abnormal neurotransmitter-endocrine interactions
  - d. Immunologic factors: viral exposure during pregnancy
  - e. High arousal levels from stress, disease, drugs, and trauma
    - (1) Stress such as bombardment of stimuli from life events may contribute to relapse and return of symptoms
    - (2) Diseases such as encephalitis
    - (3) Trauma from birth complications, head trauma
    - (4) Drugs such as cannabis and cocaine
3. Psychosocial considerations are significant; causative models postulate that biologic vulnerability interacts with stressful environmental influences
4. Onset in men usually between ages 18 and 25 years; later onset for women, between 25 and 35 years; incidence slightly higher in men
5. Chronic insecurity and failure in interpersonal relationships impair functioning
6. Disturbed relationship with environment and family is an almost universal characteristic regardless of the etiology
7. Course of disease is either acute or chronic; some demonstrate almost normal functioning with intermittent psychotic episodes; others have diminished functioning with intermittent psychotic episodes; about 10% to 25% demonstrate severely diminished functioning with ongoing psychotic symptoms

#### B Types

1. Classification of types is not static; there is overlapping symptomatology; individuals diagnosed in one classification frequently are diagnosed at a later time in another

classification

2. Paranoid: delusions of persecution and/or grandiosity; less often noted are delusional themes of jealousy, religiosity, or somatization
3. Disorganized: disorganized speech and behavior; childlike affect and uninhibited sexual behaviors; socially inept
4. Catatonic type: marked psychomotor disturbance that may involve motor immobility (waxy flexibility), excessive motor activity, extreme negativism, mutism, posturing, echolalia, or echopraxia
5. Undifferentiated: delusions, hallucinations, disorganized speech, disorganized behavior; excludes behaviors observed in paranoid, disorganized, or catatonic types
6. Residual: criteria for schizophrenia subtypes listed above are not met; there is continuing evidence of negative symptoms and two or more of these characteristic symptoms (e.g., delusions, hallucinations, disorganized speech, and gross disorganization); develops later in the course of the disease

### C Behavioral/clinical findings

1. Characteristic symptoms generally fall into two broad categories ([Table 18-2: Schizophrenia: Symptom Categorization](#))

**Table 18-2**

**Schizophrenia: Symptom Categorization**

Type I Symptoms	Type II Symptoms
Hallucinations	Apathy
Delusions	Social withdrawal
Loose association	Flat affect
Concrete thinking	Poor ADLs
Neologisms	Anhedonia
Catatonia	Paucity of ideas
Agitation/violence	Paucity of speech

#### a. Positive symptoms (additional behaviors)

- (1) Disorganized or bizarre alterations in thinking, speech, perception (e.g., altered reality testing, hallucinations, delusions), behavior, and mood
- (2) More apparent during acute relapses
- (3) More responsive to medication and interactive therapies

#### b. Negative symptoms (deficits of behaviors)

- (1) Flat affect, apathy/avolition, anhedonia, and attention deficit
- (2) More apparent during nonacute periods
- (3) Less responsive to therapy; more complex and difficult to treat

2. Problems in cognitive functioning: attention deficits, abstract concept formation, decision making, and problem solving
3. Alterations in mood: dysphoria, suicidality, and hopelessness; approximately 15% commit suicide
4. Ability to test reality is distorted by psychopathology
5. Social and occupational role dysfunction
6. Duration of at least 6 months

## D Therapeutic interventions

1. Psychotherapy (e.g., individual, family, group)
2. Motivational therapy
3. Occupational and vocational therapy
4. Daycare treatment programs in community settings that foster interpersonal relationships
5. Pharmacologic therapy (see [Chapter 16, Related Pharmacology](#), Antipsychotic Agents)
  - a. Positive symptoms: traditional antipsychotic drugs
  - b. Negative symptoms: atypical antipsychotic drugs
6. Paranoid schizophrenia is most responsive to treatment when compared with other subtypes; clients appear to function at a higher level

## ***Nursing Care of Clients with Schizophrenic Disorders***

### **Assessment/Analysis**

1. History of onset of disorder
2. Delusional ideation (fixed false belief) and/or hallucinations (perceived stimuli without external stimuli); specific assessment for command hallucinations (demand an action that may hurt self or others)
3. Suspiciousness and/or feelings of paranoia; presence and extent of fear of other clients and staff
4. History of work and social functioning
5. Precipitating or current stress factors
6. Unclear or incomplete client and family communication patterns; double-bind communication (contradictory invalidating messages)
7. Physical status

### **Planning/Implementation**

1. Respect as a human being with both dignity and worth; establish a therapeutic relationship
2. Accept at present level of functioning; meet basic physiologic needs; initially focus interactions on nonthreatening topics
3. Accept that hallucinations and delusions are real to client and possibly frightening; avoid trying to argue out of delusions or hallucinations; stay with client and provide support; focus on feelings, not misperceptions of reality
4. Encourage development of interpersonal relationships; provide consistent interactions to promote development of trust
5. Point out reality but do not impose staff's concept of reality; involve in reality-based activities such as ADLs
6. Monitor nutritional status and hygiene
7. Use distraction or set limits on inappropriate or unsafe behavior
8. Clarify unclear communication such as neologisms (invented words that have meaning)

only to client)

9. Encourage to follow a plan of organized activity and the prescribed drug regimen
10. Monitor for adverse reactions to antipsychotic medications
11. Teach to recognize and report extrapyramidal side effects (EPS); administer prescribed antiparkinsonian agents to minimize EPS
12. Encourage to continue medications even after signs and symptoms abate
13. Maintain safety, especially during acute phase; safety is the priority because of impaired judgment and/or command hallucinations

## Evaluation/Outcomes

1. Remains free from injury to self and others
2. Differentiates between hallucinations and reality
3. Demonstrates a reduction in anxiety through verbalization or body language
4. Demonstrates improved functioning with ADLs and socialization
5. Remains free from adverse side effects of psychotropic drug regimen
6. Continues therapeutic/pharmacological regimen

## Delusional (Paranoid) Disorders

### Data Base

A Etiologic factors

1. Neurobiologic perspective
  - a. Exact physiologic disruption is not well-defined
  - b. Psychotic disorders thought to involve: neurochemicals such as dopamine, serotonin, and norepinephrine; abnormal transmission of neural impulses; and difficulties at the synaptic level
  - c. Neurologic and cognitive impairments are fewer and prognosis seems better than other subtypes of schizophrenia
  - d. See Biologic components under [Schizophrenic Disorders](#)
2. Paranoid defenses considered by some to be a protective mechanism against unconscious homosexuality or overt hostility
3. Premorbid personality used the compensatory mechanisms of the projective pattern of behavior
4. Cultural and religious background variations
5. Course varies but is more hopeful than other psychotic disorders, because they are most responsive to treatment

B Behavioral/clinical findings

1. Elaborate, highly organized paranoid delusional system while preserving other functions of the personality
2. Delusions (fixed false beliefs) draw from real-life situations and have a coherent theme; delusions are not bizarre; usually limited to specific areas in client's life; predominant theme determines type of paranoia (e.g., grandiose, jealous, persecutory)

3. Suspiciousness and delusions do not exhibit the thinking and behavioral disorganization or the personality disintegration found in the other psychoses
4. Hallucinations usually are auditory and relate to the delusional theme
5. Intellectual and occupational functioning less impaired than social or marital relationships

#### C Types

1. Erotomaniac: belief that another person is in love with client; idealized, romantic love or spiritual union, rather than sexual attraction
2. Grandiose: belief that client has some great (but unrecognized) talent or insight or has made an important discovery; less commonly, claims a special relationship with a prominent person or is a prominent person
3. Jealous: belief of unfaithfulness by one's spouse or lover based on incorrect inferences
4. Persecutory: belief that client is being conspired against, spied upon, cheated, followed, poisoned or drugged, maligned, harassed, or obstructed in the pursuit of long-term goals
5. Somatic: belief that something abnormal or dangerous is happening to the body

#### D Therapeutic interventions

1. Pharmacotherapy with antipsychotic agents (see [Chapter 16, Related Pharmacology, Psychotropic Medications Antipsychotic Agents](#))
2. Individual psychotherapy

## ***Nursing Care of Clients with Delusional (Paranoid) Disorders***

### **Assessment/Analysis**

1. History of onset of disorder
2. Hallucinations, delusional ideation, and suspiciousness; may constitute a danger to self or others
3. Absence of odd or bizarre behavior and other criteria related to schizophrenia
4. Social and marital functioning

### **Planning/Implementation**

1. Provide an environment with some intellectual challenges that do not threaten security
2. Accept and recognize client's need for a superior attitude
3. Meet sarcasm and ridicule in a matter-of-fact manner; avoid counteraggression and retaliation
4. Set limits on inappropriate behaviors that are derived from delusions
5. Accept misinterpretations of events; point out reality but do not challenge delusions directly
6. Provide consistency in staff; gradually integrate into unit activities to foster social interaction

### **Evaluation/Outcomes**

1. Avoids factors that stimulate delusional thinking
2. Continues to function in society

## Schizoaffective Disorder

### ***Data Base***

#### A Etiologic factors

1. Unrelated to direct physiologic effects of a substance or medication or a general medical condition
2. Uninterrupted period of illness including a major depressive episode or manic episode concurrent with symptoms of schizophrenia (e.g., delusions or hallucinations, disorganized speech or behavior, and negative symptoms)
3. Onset in early adulthood

#### B Behavioral/clinical findings

1. Mixture of symptoms associated with both schizophrenia and mood disorders (mania or depression)
2. Thought processes and bizarre behavior appear schizophrenic in conjunction with alterations in mood (e.g., marked elation, depression)

#### C Therapeutic interventions

1. Antipsychotic and/or mood stabilizers; antidepressants may be used to treat symptoms (see [Chapter 16, Related Pharmacology](#), Antipsychotic Agents)
2. Therapy depends on type and severity of symptoms

### ***Nursing Care of Clients with a Schizoaffective Disorder***

See Nursing Care of Clients with Schizophrenic Disorders in this chapter and Nursing Care of Clients under Major Disorders Related to Alterations in Mood in [Chapter 19](#).

# CHAPTER 19

# Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood

---

# Overview

A Primary initial deficit occurs in mood or ability to manage anxiety, although there may be changes in cognition and behavior

B Anxiety disorders are the most common of all psychiatric disorders, resulting in distress and functional impairment; rarely treated in inpatient settings unless anxiety is extreme and functioning is impaired or if treated concurrently with another mental health disorder

C Anxiety and depressed mood may find expression in physical symptoms associated with somatoform and dissociative disorders

D Acting out occurs because of fear, not antisocial tendencies

E Anxiety is contagious and can be communicated to others

# Major Disorders Associated with Anxiety

## General Nursing Care of Clients with Anxiety Disorders

- A Provide an environment that limits demands and permits attention to resolution of conflicts; establish a trusting relationship
- B Identify precipitating stressors and limit them if possible
- C Intervene to protect from acting out on impulses that may be harmful to self or others
- D Accept symptoms as real to client; do not emphasize or call attention to them
- E Attempt to limit client's use of negative defenses, but do not try to stop them until ready to give them up
- F Help to develop appropriate ways of managing anxiety-producing situations through problem solving and cognitive/behavioral therapies; assist to expand supportive network; assist significant others to understand the client's situation
- G Plan a routine schedule of activities
- H Manage aggressive behavior progressively (e.g., diversion, limit setting, medication administration, seclusion, restraints)
- I Collect and document information to assist with determining presence of both an anxiety disorder and depression (comorbidity)
- J Encourage to develop a balance between work and relaxation

## Generalized Anxiety Disorder (GAD)

### **Data Base**

- A Etiologic factors
  1. Psychologic, behavioral, and neurobiologic theories are postulated; the latter is most promising
  2. Functions to permit some measure of social adjustment
  3. Commonly begins in early adulthood as a result of environmental factors and pressures of decision making; early life is rigid and orderly
  4. Excessive anxiety and worry involves at least two life situations
  5. Unrelated to physiologic effects of substances or a medical condition
- B Behavioral/clinical findings
  1. Persistent anxiety (longer than 6 months) and excessive worry associated with three or more of the following symptoms: restlessness (akathisia) or feeling on-edge, becomes easily fatigued, difficulty concentrating, irritability, muscle tension, and sleep disturbance
  2. Inability to control the anxiety
  3. Impairment in social or occupational relationships
  4. Symptoms of autonomic hyperarousal (e.g., tachycardia, tachypnea, dizziness, and dilated pupils); however, they are less prominent than in other anxiety disorders
- C Therapeutic interventions: same as those listed under Panic Disorders

# ***Nursing Care of Clients with Generalized Anxiety Disorder***

See [General Nursing Care of Clients with Anxiety Disorders](#) under Major Disorders Associated with Anxiety and [Nursing Care of Client with Panic Disorder](#) under Panic Disorder

## **Panic Disorder**

### ***Data Base***

#### A Etiologic factors

1. Biochemical and genetic theories are most often cited as the underlying cause; no one gene or biochemical dysfunction has been identified
2. Onset varies, most often noted between late adolescence and mid-30s; infrequently may begin in childhood or after age 45; early life rigid and orderly
3. Discrete periods of intense discomfort for more than 1 month in duration
4. Recurrent attacks of severe anxiety may be associated with a stimulus or can occur spontaneously
5. Pressures of decision making regarding lifestyle that occur in early adult years act as precipitating factors
6. Functions to permit some measure of social adjustment

#### B Behavioral/clinical findings

1. Brief attacks of overwhelming, intense discomfort
2. Attack must be accompanied by four or more of the following symptoms: palpitations or accelerated heart rate; sweating; trembling or shaking; shortness of breath; feelings of choking, chest pain, or discomfort; nausea or abdominal distress; depersonalization; fear of losing control; fear of dying; paresthesias; and chills or hot flashes

#### C Therapeutic interventions

1. Complete diagnostic workup to rule out physical illness
2. Psychotherapy, family therapy, group therapy, cognitive/behavioral therapies
3. Psychotropic medications: sedative/hypnotic and antianxiety agents are used short term when client is unable to cope or accomplish daily activities and until healthier coping emerges; antidepressants are used prophylactically in long-term therapy (see [Chapter 16](#), Related Pharmacology, Psychotropic Medications, Sedative and Hypnotic Agents and Antianxiety/Anxiolytic Medications)

## ***Nursing Care of Clients with Panic Disorder***

### **Assessment/Analysis**

1. Progression of somatic symptoms
2. Interference in activities of daily living (ADLs) and social and occupational functioning
3. Situational triggers that may precipitate the onset of an attack
4. Determination whether panic symptoms are related to a phobia (e.g., agoraphobia)

## Planning/Implementation

1. See [General Nursing Care of Clients with Anxiety Disorders](#)
2. Remain with client during an attack; maintain safety
3. Remain calm and in control of the situation
4. Assign to a private room if hospitalized because it decreases environmental stimuli
5. Administer prescribed medications

## Evaluation/Outcomes

1. Identifies situations that increase anxiety
2. Demonstrates increased use of anxiety-reducing behaviors
3. Follows prescribed treatment regimen
4. Reports a decreased number of panic attacks

## Phobic Disorders

### ***Data Base***

#### A Etiologic factors

1. Anxiety unconsciously transferred to an inanimate object or situation, which then symbolically represents the conflict and can be avoided
2. Anxiety is severe if the object, situation, or activity cannot be avoided
3. Multiple theories as to cause (e.g., genetic, psychologic, developmental, and environmental); etiology is unverified
4. Onset begins in childhood; traumatic phobias can occur throughout the life span
5. Pressures of decision making regarding lifestyle that occur in the early adult years act as precipitating factors

#### B Behavioral/clinical findings

1. Anxiety develops when exposed to a situation that threatens the sense of security
2. Active attempts to avoid the precipitating object/situation
3. Lifestyle is often greatly limited depending on the phobic object/situation
4. Fear of being trapped, embarrassed, or humiliated in social situations
5. Able to recognize that the fear is excessive or unreasonable but cannot control it

#### C Types

1. Agoraphobia: fear of being alone or in public places where help would not be immediately available if necessary (e.g., tunnels, bridges, crowds, buses, trains)
2. Social phobia: fear of doing something in public that could be embarrassing or cause negative evaluations (e.g., speaking, dancing, eating)
3. Specific phobia: fear of a particular object, animal, or situation

#### D Therapeutic interventions

1. Same as those listed under Panic Disorder
2. Behavior modification: a counter-conditioning technique to overcome fears by gradually increasing exposure to feared object, situation, or animal (desensitization) or by continuous exposure to the feared stimulus until anxiety is extinguished (flooding)

3. Pharmacologic and cognitive therapies

## ***Nursing Care of Clients with Phobic Disorders***

### **Assessment/Analysis**

1. Presence, type, and duration of phobia
2. Interference in ADLs and social and occupational functioning
3. Avoidance behaviors to prevent exposure to phobic object or stress-producing situation
4. Pervasive anxiety and fear
5. Behaviors associated with other anxiety disorders

### **Planning/Implementation**

1. See [General Nursing Care of Clients with Anxiety Disorders](#)
2. Identify and accept client's feelings about phobic object or situation
3. Provide constant support if exposure to phobic object or situation cannot be avoided
4. Assist with relaxation and cognitive/behavioral techniques to control or diminish anxiety levels

### **Evaluation/Outcomes**

1. Copes with anxiety-producing object or situation effectively
2. Continues prescribed treatment regimen
3. Uses relaxation techniques to diminish anxiety

## **Obsessive-Compulsive Disorder (OCD)**

### ***Data Base***

#### **A Etiologic factors**

1. Chronic anxiety disorder with decreased levels of serotonin
2. Control of anxiety with obsessions (intrusive recurring thoughts) or compulsions (repetitive ritualistic behaviors)
3. Compulsive behavior precedes obsessive thinking
4. Symptoms worsen with stress
5. OCD symptoms are similar in adults and children; adults recognize behavior is excessive and interferes with daily activities but cannot be controlled; children do not have this insight
6. Pressures of decision making regarding lifestyle that occur in the early adult years act as precipitating factors; some evidence that early life patterns were rigid and orderly

#### **B Behavioral/clinical findings**

1. Major defensive mechanisms are isolation, undoing, and reaction formation; intellectual and verbal defenses are used
2. Thoughts persist and become repetitive and obsessive

3. Demonstrates indecisiveness and a striving for perfection and superiority
4. Anxiety and depression present in various degrees, particularly if rituals are prevented
5. Obsessions or compulsions consume most of client's waking hours (at minimum more than 1 hour per day) and interfere with ADLs, occupation, social activities, or relationships
6. Limiting or interrupting a ritual increases anxiety

#### C Therapeutic interventions

1. Same as those listed under Panic Disorder
2. Behavior modification to attempt to limit length and/or frequency of ritual
3. Cognitive therapy
4. Psychotropic medications: clomipramine (Anafranil) and fluvoxamine (Luvox) to control symptoms

## ***Nursing Care of Clients with Obsessive-Compulsive Disorders***

### **Assessment/Analysis**

1. Type and use of ritual or obsession
2. Level of anxiety (e.g., mild, moderate, severe, panic)
3. Level of interference in lifestyle
4. Extent of danger inherent in ritual or obsession
5. Behaviors associated with other anxiety disorders

### **Planning/Implementation**

1. See [General Nursing Care of Clients with Anxiety Disorders](#)
2. Allow performance of the ritual initially unless ritual causes harm and must be stopped (e.g., excessive hand washing causing skin damage); eventually attempt to limit length and frequency of the ritual
3. Support attempts to reduce dependency on the ritual
4. Role model appropriate behavior and discuss adaptive responses

### **Evaluation/Outcomes**

1. Decreases obsessive thoughts and length and frequency of ritual
2. Follows prescribed treatment regimen
3. Learns new adaptive coping responses

## **Posttraumatic Stress Disorder (PTSD)**

### ***Data Base***

#### A Etiologic factors

1. Follows a devastating event that is outside the range of usual human experience (e.g., rape, assault, military combat, hostage situations, natural or precipitated disasters)
2. Neurobiology of PTSD does not follow the usual fight-or-flight stress response; studies

indicate a complex interaction of neuroendocrinology, neuroanatomy, genetics, and traumatic stress

3. Adult's response involves intense fear, helplessness, or horror; child's response involves disorganized or agitated behaviors
4. Traumatic event is persistently reexperienced as flashbacks, distressing dreams, sense of reliving the experience, or exposure to situations (including anniversaries) that foster recall of the event

#### B Behavioral/clinical findings

1. Exposure to a traumatic event resulting in death, threatened death, or serious injury to others or self
2. Responds to traumatic event with intense fear, confusion, helplessness, horror, or denial
3. Feelings of isolation and detachment; depression
4. Interrupted concentration; difficulty sleeping
5. Violent outbursts of anger
6. Hypervigilance; hyperarousal; exaggerated startle reflex; avoidance of associated stimuli
7. Risk taking behaviors; substance abuse in attempt to control symptoms

#### C Therapeutic interventions

1. Same as those listed under Panic Disorder
2. Behavior modification to provide controlled exposure to recall of event
3. Use of eye movement, desensitization, reprocessing techniques (EMDR)
4. Imagery, relaxation, and meditation
5. Cognitive restructuring and reframing

## ***Nursing Care of Clients with Posttraumatic Stress Disorder***

### **Assessment/Analysis**

1. History of traumatic experience
2. Sleep-pattern disturbances, outbursts of anger, and decreased concentration
3. Screening for symptoms of major depression, phobias, and substance abuse
4. Behaviors associated with other anxiety disorders

### **Planning/Implementation**

1. See [General Nursing Care of Clients with Anxiety Disorders](#)
2. Stay with client when memory of event returns to conscious level
3. Protect from acting out violently with disregard for safety of self or others

### **Evaluation/Outcomes**

1. Uses positive coping mechanisms to manage anxiety and reactions to the traumatic event and its flashbacks
2. Verbalizes a decrease in dreams or flashbacks regarding the traumatic event

3. Follows prescribed treatment regimen

# Major Somatoform Disorders

## General Nursing Care of Clients with Somatoform Disorders

- A Identify when anxiety is translated into physical illness or bodily complaints (somatization)
- B Establish a trusting relationship
- C Provide an environment that limits demands on and permits attention to resolution of conflicts
- D Identify pattern of recurring clinically significant somatic symptoms; accept that symptoms are real to client
- E Attempt to limit client's use of negative defenses, but do not try to stop them until ready to give them up
- F Help to develop appropriate ways of managing anxiety-producing situations through problem solving and cognitive therapies
- G Accept physical symptoms but do not talk about, emphasize, or call attention to them
- H Minimize sick-role behavior; encourage independence within abilities; avoid providing secondary gains
- I Encourage to develop a balance between work and relaxation
- J Help to identify and label needs met by symptoms

## Conversion Disorders

### **Data Base**

- A Etiologic factors
  1. Anxiety unconsciously converted to physical symptoms that are not under voluntary control; usually localized to one area of the body; symptoms permit avoidance of an unacceptable activity
  2. Symptom or deficit is not related to an underlying medical condition, to substances, or to a cultural norm; distinguishes conversion from psychophysiologic disorders associated with tissue changes
  3. Symptoms permit some measure of social adjustment
  4. Onset before 30 years of age; may recur
  5. Physical illness frequently used by family as excuse for problems; early life often rigid and orderly
  6. Pressures of decision making regarding lifestyle in early adult years act as precipitating factors
- B Behavioral/clinical findings
  1. Symptoms or deficits that affect voluntary motor or sensory function (e.g., paralysis, blindness, deafness)
  2. Conflicts or stressors (usually dependence versus independence) precede initiation or exacerbation of symptoms or deficits

3. Noticeable lack of concern about problem (“la belle indifference”)
4. Impairment may vary over different episodes; may not follow anatomic structure (e.g., paralysis or numbness may circle foot or arm [stocking-and-glove anesthesia])

#### C Therapeutic interventions

1. Complete diagnostic workup to rule out physical problems
2. Psychotherapy, family therapy, group therapy as necessary to resolve severe emotional problems
3. Psychotropic medications: antidepressants (selective serotonin reuptake inhibitors [SSRIs]); antianxiety agents rarely helpful (see [Chapter 16](#), The Practice of Mental Health/Psychiatric Nursing, Related Pharmacology: Psychotropic Medications, Antidepressants)

## ***Nursing Care of Clients with Conversion Disorders***

### **Assessment/Analysis**

1. Presence of physical symptoms with no pathophysiologic basis
2. Level of concern regarding physical symptoms
3. Degree of impairment
4. Level of anxiety

### **Planning/Implementation**

See [General Nursing Care of Clients with Somatoform Disorders](#)

### **Evaluation/Outcomes**

1. Uses problem solving rather than physical symptoms to manage anxiety-producing situations
2. Decreases episodes that use physical symptoms to manage anxiety

## **Body Dysmorphic Disorders**

### ***Data Base***

#### A Etiologic factors

1. Preoccupation (not of a delusional intensity) with a defect in appearance, either imagined or exaggerated, even if there is a slight defect
2. Onset usually during adolescence but can begin in childhood; may continue for years
3. No predisposing factor in early life or family patterns is identified

#### B Behavioral/clinical findings

1. History of multiple plastic surgeries to correct imagined defects
2. Preoccupation with imagined deficit causes avoidance or impairment in social and occupational relationships
3. Often exhibits symptoms of depression or obsessive-compulsive personality traits

#### C Therapeutic interventions

1. Same as those listed under Conversion Disorder

## ***Nursing Care of Clients with Body Dysmorphic Disorders***

### **Assessment/Analysis**

1. Preoccupation with imagined physical defects
2. History of medical and surgical therapies to correct imagined defects
3. Ability to manage stressful situations
4. Level of anxiety

### **Planning/Implementation**

See [General Nursing Care of Clients with Somatoform Disorders](#)

### **Evaluation/Outcomes**

1. Uses problem solving rather than physical defect to manage anxiety-producing situations
2. Verbalizes that emphasis on physical defect is exaggerated
3. Accepts and is comfortable with self

## **Hypochondriasis**

### ***Data Base***

A Etiologic factors

1. Preoccupation with belief that there is a serious illness because of misinterpretation of physical symptoms
2. Diagnostic evaluation does not support beliefs and does not allay client fears
3. Client's knowledge of symptoms associated with a disease aids in development of a similar set of symptoms, leading to a conclusion that the disease is present
4. Psychosocial stresses influence development of this disorder
5. Usually begins between 20 and 30 years of age; can occur across the life span

B Behavioral/clinical findings

1. Misinterpretation and exaggeration of physical symptoms
2. Inability to accept reassurance even after exhaustive testing and therapy; leads to "doctor shopping"
3. History of repeated absences from work
4. Adoption of sick role and invalid lifestyle

C Therapeutic interventions

1. Same as those listed under Conversion Disorder

## ***Nursing Care of Clients with Hypochondriasis***

### **Assessment/Analysis**

1. Level of preoccupation with symptoms
2. Duration and degree of impaired functioning associated with symptoms
3. History of psychosocial precipitant stressors

## **Planning/Implementation**

See [General Nursing Care of Clients with Somatoform Disorders](#)

## **Evaluation/Outcomes**

1. Accepts that there is no physical basis for the symptoms
2. Uses more effective coping mechanisms to manage anxiety
3. Continues therapy even after condition has improved

## **Dissociative Disorders**

### ***Data Base***

A Characterized by either a sudden or a gradual disruption in integrated functions of consciousness, memory, identity, or perception of the environment

B May be transient or become a well-established pattern

C Etiologic factors: related to increased stress or traumatic event(s) such as sexual abuse during childhood

D Types

1. Dissociative amnesia: inability to recall important personal information, usually of a traumatic or stressful nature as distinguished from ordinary forgetfulness
2. Dissociative fugue: sudden, unexpected travel accompanied by an inability to recall one's past, identity confusion, or assumption of a new identity
3. Dissociative identity (also known as multiple personality disorder): coexistence of two or more distinct personalities within an individual
4. Depersonalization: persistent or recurrent feeling of being detached from one's mental processes or body that is accompanied by intact reality testing

E Behavioral/clinical findings

1. Inability to recall important personal information usually of a traumatic or stressful nature
2. Gaps in recalling aspects of one's life history; usually related to traumatic episodes

F Therapeutic interventions

1. Complete diagnostic workup to rule out possibility of organic causes (e.g., brain tumor)
2. Psychotherapy (e.g., individual, family)
3. Development of more effective and satisfying ways to manage anxiety

### ***Nursing Care of Clients with Dissociative Disorders***

## **Assessment/Analysis**

1. Identity; memory; consciousness
2. Physical condition
3. Psychosocial component to discover fundamental anxiety source
4. History of emotional trauma in childhood
5. Suicidal risk
6. Recent use of alcohol or drugs

## **Planning/Implementation**

1. See [General Nursing Care of Clients with Anxiety Disorders](#)
2. Assist with treatment plan to alleviate symptoms
3. Reinforce effective coping skills
4. Assist with problem solving
5. Encourage involvement in individual long-term therapy and family therapy

## **Evaluation/Outcomes**

1. Recalls and identifies past experiences accurately
2. Verbalizes increased satisfaction with family and work relationships
3. Ceases incidents of being absent without explanation
4. Develops more effective coping mechanisms to manage anxiety

# Major Disorders Related to Alterations in Mood

## General Nursing Care of Clients with Mood Disorders

- A Monitor nutritional intake and elimination
- B Keep environment nonchallenging with decreased stimuli; avoid boredom; focus on feelings
- C Observe for mood swings, irritability, and depressive episodes
- D Protect from suicide or violent acting out; keep under constant observation if necessary; keep communication open and direct; ask if client has a specific plan to commit suicide
- E Keep activities simple, uncomplicated, and repetitive and of short duration requiring little concentration
- F Base activities on client's status: psychomotor retardation in depression and hyperactivity in mania; initiate one-to-one interactions with client and eventually expand to one or two other people
- G Observe for adverse effects of drugs; monitor therapeutic blood levels if appropriate
- H Encourage to continue medications even after symptoms abate
- I Provide information regarding special dietary precautions when taking certain medications (e.g., monoamine oxidase inhibitors [MAOIs])
- J Assist with developing coping strategies; plan for follow-up support and supervision

## Bipolar Disorder

### **Data Base**

- A Characterized by a cyclical disturbance of mood, encompassing emotional extremes: episodes of vehement energy of mania, despair and lethargy of depression, or a mixture of both
- B Presence of one or more manic or hypomanic episodes with a history of depressive episodes; predominant mood is elevated or irritable, accompanied by one or more of these symptoms: hyperactivity, lack of judgment with no regard for consequences, pressured speech, flight of ideas, distractibility, inflated self-esteem, risky behavior, and hypersexuality
  1. Hypomanic: mood elation with higher than usual activity and social interaction, but not as expansive as full mania; a distinct period of elevated or irritable mood that is different from mania; duration of at least 4 days
  2. Mania: elevated, expansive, or irritable mood accompanied by hyperactivity, grandiosity, and loss of reality
- C Neurobiologic perspective
  1. Neurotransmitters, or certain chemicals in the brain that regulate mood, have been identified (e.g., serotonin, dopamine, norepinephrine, and gamma-aminobutyric acid [GABA])
    - a. Increased levels of norepinephrine, dopamine, and serotonin in acute mania

- b. Decreased levels of norepinephrine, dopamine, and serotonin in depression
- 2. Research suggests this disorder results from complex interactions among chemicals, including neurotransmitters and hormones
- 3. Family and twin studies suggest a genetic component, but no gene has been identified except in rare, familial forms of the disorder
- 4. Biologic rhythms and physiology related to depression show abnormal sleep electroencephalogram (EEG), sensitivity to absence of sunlight, and circadian rhythm disturbance
- D Physiologic theory postulates that mood also may respond to drugs or a variety of physical disorders
- 1. Drugs associated with depressive status: alcohol, sedative-hypnotics, amphetamine withdrawal, glucocorticoids, propranolol, risperidone, and steroid contraceptives
- 2. Drugs associated with manic status: cocaine, MAOIs, tricyclic antidepressants, steroids, and levodopa
- 3. Physical illness, such as brain attack (cerebrovascular accident) and some endocrine disorders (e.g., Cushing disease and hypothyroidism) can lead to depressive episodes
- 4. Obesity is a related factor to depression
- E May be response to loss (dysfunctional grieving), increased stress, or change in life events, role, and sleeping and/or eating patterns; overreaction to stress may lead to suicide
- F Generally occurs between 20 and 40 years of age; however, reported in clients older than 50 years, and increasingly in children and adolescents
- G Resumption of customary activities between episodes

## Depressive Episode of a Bipolar Disorder

### **Data Base**

A Etiologic factors: see [Data Base](#) under Bipolar Disorder

B Behavioral/clinical findings

- 1. Either a depressed mood or loss of interest or pleasure, occurring during a 2-week period, with a change in level of functioning, plus five or more of the following:
  - a. Change in weight
  - b. Insomnia (especially early morning awakening)
  - c. Psychomotor agitation or retardation
  - d. Fatigue
  - e. Worthless feelings or inappropriate guilt
  - f. Somatic complaints
  - g. Diminished hygiene
  - h. Concentration difficulties
  - i. Inability to make decisions
  - j. Social withdrawal
  - k. Pessimism
  - l. Suicidal behavior progresses from suicidal ideation, suicide threats, suicide

gestures, suicide attempts, to successful suicides; presuicidal behaviors include no interest in the future, giving away personal possessions

2. Orientation and logic unaffected
3. Sex drive (libido) decreased
4. Constipation and urinary retention
5. Anniversary reaction: depression and suicidal gestures may increase as anniversary of loss of loved object nears

#### C Therapeutic interventions

1. Antidepressant medications that increase the level of norepinephrine and serotonin (see [Chapter 16](#), The Practice of Mental Health/Psychiatric Nursing, Related Pharmacology: Psychotropic Medications, Antidepressants)
2. Cognitive and behavioral psychotherapy
3. High-protein, high-carbohydrate diet; dietary supplements if necessary
4. Electroconvulsive therapy (ECT)
  - a. Brief electrical stimulus applied to brain, resulting in a seizure that alters brain chemistry and eventually alters mood
  - b. Used most often for recurrent depressions, delusions, suicidal ideation, and clients who are resistant to drug therapy
  - c. A depolarizing muscle relaxant causes paralysis (e.g., succinylcholine [Anectine]), which reduces intensity of muscle contractions during tonic/clonic stage of seizure; given after a short-acting barbiturate or other sedative/anesthetic such as propofol (Diprivan)
  - d. Side effects: fatigue, muscle soreness, mild temporary confusion, and short-term memory loss; effects should resolve a few weeks after treatment ends

## ***Nursing Care of Clients during a Depressive Episode of Bipolar Disorder***

### **Assessment/Analysis**

([Table 19-1](#): Bipolar Disorder: Symptoms of Depression)

---

#### **Table 19-1**

#### **Bipolar Disorder: Symptoms of Depression**

---

Affect	Cognition	Physiology	Behavior
Apathy	Pessimism	Anorexia	Decreased ADLs
Anhedonia	Worry	Insomnia	Irritability
Anxiety	Poor	Early-morning awakening	Agitation
Anger	concentration	Fatigue	Psychomotor
Guilt	Slowed thinking	Constipation	retardation
Helplessness	Indecisiveness	Impotence	Social withdrawal
Loneliness	Hypochondriasis	Decreased libido	Crying
Low	Suicidal ideation	Hypersomnia and compulsive	Self-abusive acts
self-esteem	Negative	eating initially in some	Substance abuse
Sadness	self-appraisal	clients; this changes to	
Emptiness	Psychosis	anorexia and insomnia as	
Flat expression		depression worsens	

1. Feelings of worthlessness, guilt; often fearful of feelings
2. Suicidal ideation or acting out; presence of a plan increases the danger of suicide; may be ambivalent about suicide
3. Depressed mood, loss of interest or pleasure, and slowing of psychomotor activity
4. Weight for recent changes and to establish a baseline
5. Changes in sleep patterns
6. Changes in ability to concentrate

## Planning/Implementation

1. See [General Nursing Care of Clients with Mood Disorders](#)
2. Accept inability to carry out daily routines; assist with ADLs
3. Set expectations that can be achieved
4. Provide realistic praise whenever possible
5. Involve in simple repetitious tasks and activities
6. Accept feelings of worthlessness as real; do not deny, condone, or approve feelings
7. Spend time with client to demonstrate recognition of client's worth
8. Protect from acting on suicidal thoughts, especially when depression begins to lift; suicide is a real and ever-present danger throughout entire illness
9. Teach about ECT procedure
  - a. Informed consent required
  - b. Never left alone during and after the procedure; remain in recovery for 1 to 3 hours after procedure; criteria for return to unit includes stable vital signs, alert, oriented, and able to ambulate without assistance
  - c. Eliminate food and fluids for 6 to 8 hours before procedure

- d. Asleep at beginning of procedure; short-acting sedative administered
  - e. Oxygen administered before and after the procedure
  - f. Full-body muscle response is minimized by medication; muscle-paralyzing agent administered
  - g. Brief electrical stimulus (no more than 2 seconds) precipitates seizure that eventually causes an elevation in mood
  - h. May experience disorientation, headache, and muscle aches for about 1 hour after procedure; analgesic given to treat headache
  - i. May experience temporary memory loss during and for several weeks after completion of therapy
10. Refer for grief counseling, assertiveness training, and anger management

## Evaluation/Outcomes

- 1. Remains free from injury
- 2. Verbalizes feelings
- 3. Verbalizes increased feelings of self-worth
- 4. Continues prescribed treatment regimen
- 5. Returns to preillness level of functioning

## Manic Episode of a Bipolar Disorder

### Data Base

A Etiologic factors: see [Data Base](#) under Bipolar Disorder

B Behavioral/clinical findings

- 1. Persistently elevated, expansive, or irritable mood for a duration of 1 week, plus three or more of the following:
  - a. Grandiosity
  - b. Insomnia
  - c. Verbosity (pressured speech)
  - d. Flight of ideas
  - e. Hypersexuality
  - f. Distractibility
  - g. Social intrusiveness
  - h. Psychomotor agitation
  - i. Excessive involvement in pleasurable activities without regard for consequences (e.g., shopping, gambling, sexual activity)
- 2. Marked impairment in daily functioning, occupational and social activities, and relationships
- 3. Excessive overactivity requiring hospitalization to prevent harm to self or others
- 4. Symptoms are unrelated to physical illness or physiologic effects of a substance

C Therapeutic interventions

- 1. High-protein, high-carbohydrate diet; handheld foods should be available; adequate

fluids

2. Behavioral and cognitive therapy when medication has decreased mania
3. Pharmacologic approach: improves productivity by decreasing psychomotor activity or response to environmental stimuli; antimanic and mood stabilizing agents (e.g., lithium, anticonvulsants) (see [Chapter 16](#), Practice of Mental Health/Psychiatric Nursing, Related Pharmacology: Psychotropic Medications, Antimanic and Mood Stabilizing Agents)

## ***Nursing Care of Clients during a Manic Episode of a Bipolar Disorder***

### **Assessment/Analysis**

([Table 19-2](#): Bipolar Disorder: Symptoms of Mania)

**Table 19-2**

**Bipolar Disorder: Symptoms of Mania**

Affect	Cognition	Physiology	Behavior
Extroverted	Poor insight	Weight loss	Pressured speech
Irritable/brittle	Impulsive	Dehydration	Increased libido
Overly optimistic	Poor judgment	Poor nutrition	Spending sprees
Euphoric/high	No introspection	Lack of sleep	Restlessness
Labile	Poor concentration	Does not feel tired	Wastes energy
Lack of shame or guilt	Flight of ideas		Legal troubles
Overly humorous	Loose association		Aggressive
Low intimacy	Poor reality testing		Irresponsible
	Distractibility		Inappropriate attire
	Grandiose and persecutory delusions		Socially intrusive
	Weak ego boundaries		

1. Progression of manic behavior
2. Extent of elevated mood
3. Extent of psychomotor agitation
4. Impairment in performing ADLs
5. Feelings of grandiosity and euphoria
6. Nutrition, hygiene, and rest patterns
7. Danger to self or others

## 8. Physiologic status

### Planning/Implementation

1. See [General Nursing Care of Clients with Mood Disorders](#)
2. Accept client while rejecting objectionable behavior
3. Permit expression of hostility and ambivalence without reinforcement of guilt feelings that usually are precipitated by anxiety
4. Approach in a calm, collected manner and maintain self-control
5. Set limits for intrusive, aggressive, and hyperactive behavior; channel excess energy into safe, nonstrenuous, noncompetitive activities
6. Communicate in a nonargumentative manner
7. Use client's easy distractibility to interrupt hyperactive behavior, which may avoid injury and exhaustion
8. Advise caregivers to approach client in a consistent manner
9. Limit physical exhaustion and maintain physical health; provide foods that can be eaten on the run
10. Maintain environmental safety for client, other clients, and staff
11. Maintain client's contact with reality by helping with grooming and dressing
12. Monitor medications and side effects
13. Educate family as to early symptoms of hypomanic episode

### Evaluation/Outcomes

1. Exhibits a decrease in manic behavior
2. Verbalizes feelings of increased self-worth
3. Maintains adequate nutrition
4. Adheres to medication regimen
5. Demonstrates an absence of destructive behaviors

## Major Depression

### Data Base

#### A Etiologic factors

1. See [Data Bases](#) under Bipolar Disorder and [Depressive Episode of a Bipolar Disorder](#)
2. Neurotransmitter dysregulation includes serotonin, norepinephrine, dopamine, acetylcholine, and GABA systems; altered neuropeptides include corticotropin-releasing hormones
3. Individuals with chronic or severe medical conditions are at increased risk
4. Psychosocial stressors associated with a major loss play a significant role in first or second depressive onset
5. Familial history among close biologic relatives increases risk for disorder
6. Onset usually in late 20s, but may occur across life span

#### B Behavioral/clinical findings

1. Recurrent pessimistic thoughts; suicidal ideation with or without a plan ([Table 19-3: Suicide: Stressors and Risk Factors and Lethality of Means Chosen](#))

**Table 19-3**  
**Suicide: Stressors and Risk Factors and Lethality of Means Chosen**

Stressors and Risk Factors	
Older adults	
Male gender	
Single status	
Social isolation	
Chronic and painful illnesses	
Substance abuse (including overdose, intoxication, withdrawal)	
History of attempts	
Specific plan	
Availability of means to commit suicide	
Recent stressors	
Psychiatric illness (especially depression and schizophrenia)	
Inadequate coping skills	
Religious/cultural attitudes	
Lethality of intended means of suicide	
Lethality of Means Chosen	
Higher	Lower
Hanging	Overdose
Guns	Wrist cutting
Jumping	

People die from “lower lethality” methods. All suicidal threats, gestures, and attempts must be taken seriously.

2. Interruption in thinking and concentration that may interfere with occupational and social functioning; difficulty making decisions
3. Diminished interest or pleasure in all activities (anhedonia); apathy
4. Decreased appetite with weight loss or overeating with weight gain
5. Psychomotor retardation; anergia; constipation
6. Anxiety, somatic ailments, tearfulness, fearfulness, and hopelessness
7. Insomnia or hypersomnia
8. Feelings of worthlessness

9. Inappropriate guilt

C Therapeutic interventions

See [Depressive Episode of a Bipolar Disorder](#), Data Base, Therapeutic interventions

### ***Nursing Care of Clients with Major Depression***

See [General Nursing Care of Clients with Mood Disorders](#) and [Nursing Care of Clients during a Depressive Episode of a Bipolar Disorder](#)

## **Cyclothymic Disorder**

### ***Data Base***

A Etiologic factors

1. Numerous hypomanic episodes dispersed with periods of depressed mood and lack of interest in pleasurable activities
2. No evidence of obvious manic or major depressive episodes
3. Mood disturbance not caused by physiologic effects of substances or a physical illness
4. Symptom-free intervals usually are shorter than 2 months' duration
5. Duration: at least 2 years in adults; in children/adolescents irritable mood can continue for at least 1 year

B Behavioral/clinical findings

1. Alternating mood swings between elation and sadness; apparently unrelated to external environment
2. Individual is regarded as temperamental, moody, unpredictable, inconsistent, or unreliable
3. Mood swings do not have obvious emotional intensity
4. See Data Base under Bipolar Disorder for hypomanic symptoms

C Therapeutic interventions

1. Often unnecessary; if required, same as those listed under Depressive or Manic Episode of a Bipolar Disorder
2. Medication often unnecessary; if required, same as those listed under Depressive or Manic Episode of a Bipolar Disorder

### ***Nursing Care of Clients with a Cyclothymic Disorder***

See [General Nursing Care of Clients with Mood Disorders](#), [Nursing Care of Clients during a Depressive Episode of a Bipolar Disorder](#) and [Nursing Care of Clients during a Manic Episode of a Bipolar Disorder](#)

## **Dysthymic Disorder**

### ***Data Base***

A Etiologic factors

1. Biochemical theories continue to be researched

2. Genetic transmission theories derived from family studies

3. Feelings of guilt or brooding about the past

4. Depression may progress to suicide

B Behavioral/clinical findings

1. Depressed mood for most of day

2. Two or more of the following: depressed appetite or overeating, insomnia, low energy or fatigue, low self-esteem, concentration/problem-solving difficulties, feelings of hopelessness, anergia

3. Some impairment in social, occupational, and other roles (less than with major depression)

4. No evidence of manic or hypomanic episodes in present or past history

5. In children/adolescents symptoms noted are irritability and depression, low self-esteem, poor social skills, pessimism, and impaired school performance and social interactions

6. Duration: at least 2 years in adults; irritable mood for at least 1 year in children and adolescents

C Therapeutic interventions

1. Often unnecessary; if required, same as those listed under Depressive Episode of a Bipolar Disorder

2. Medications often unnecessary; if required, same as those listed under Depressive Episode of a Bipolar Disorder

## ***Nursing Care of Clients with a Dysthymic Disorder***

See [General Nursing Care of Clients with Mood Disorders](#) and [Nursing Care of Clients during a Depressive Episode of a Bipolar Disorder](#)

# CHAPTER 20

# Nursing Care of Clients with Disorders Related to Alterations in Behavior

---

# Overview

A The primary/initial deficit occurs in behavior, although there will be changes in the client's mood and cognition

B Includes disorders with dysfunctional behaviors

1. Sleep disorders
2. Eating disorders
3. Personality disorders
4. Adjustment disorders
5. Substance abuse
6. Factitious disorders (although not classified as psychiatric illnesses in the Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition, Text Revision (DSM-IV-TR), they are also maladaptive behaviors and will be presented here)

# Major Disorders Related to Alterations in Behavior

## Sleep Disorders

### *Data Base*

#### A Basic information

1. A common problem in adults, rarely treated in an inpatient psychiatric setting, can present as a symptom of depressive, manic, or anxiety disorders
2. Sleep consists of two distinct states: REM (rapid eye movement), also called dream sleep, and NREM (non-REM) sleep, which is divided into four stages
3. Sleep is a cyclic phenomenon with restorative qualities
4. Sleep disorders are conditions that repeatedly disrupt the pattern of sleep, leading to diminished performance

#### B Etiologic factors

1. The sleep cycle evolves throughout the life cycle and decreases with age
2. It is a disorder from which the client usually recovers, because the changes may be reversible and temporary if treated
3. Neuroendocrine arousal system is thought to release corticosteroids by the hypothalamic-pituitary-adrenal axis, as well as stimulate the neurotransmitter system, producing norepinephrine and serotonin
4. Genetic factors show a biologic tendency that may be inherited (e.g., light sleepers in a family); no single gene has been identified
5. Environmental factors are thought to contribute to sleep disturbances, such as jet lag, shift work, fast pace of life, stress, and noise
6. Biologic factors such as cardiovascular, endocrine, psychiatric, infections, cough related to pulmonary disease, pain, use of stimulants including caffeine, and side effects or drug interactions of many medications contribute to sleep-related problems
7. Impaired function results from sleep deprivation

#### C Types

1. Primary
  - a. Insomnia: disorder of initiating or maintaining sleep not caused by physical or mental illness
  - b. Parasomnias: disorders associated with sleep stages (e.g., sleepwalking, night terrors, nightmares, restless leg syndrome, and enuresis); most common in children
  - c. Narcolepsy: disorder of repeated uncontrollable brief episodes of sleep while engaging in meaningful activities
2. Secondary
  - a. Sleep disorders related to mental disorders—noted in this category are anxiety-related disorders, depressive disorders, and manic episodes
  - b. Substance-induced sleep disorders—included in this subclass are conditions related to intoxication, periods of withdrawal, use of stimulants, and side effects of

many medications

- c. Sleep disorders related to general medical condition—included in this category is sleep apnea; etiology must be established through history, physical examination, or laboratory findings in this subclass

#### D Behavioral/clinical findings

1. Onset usually in young adulthood; more prevalent with increasing age
2. Difficulty initiating or maintaining sleep, or nonrestorative sleep, for at least 1 month
3. Depression usually associated with fragmented sleep patterns
4. Sleeplessness as a cardinal feature noted in manic disorders; an early sign of impending mania in bipolar disorders
5. Abuse of alcohol or stimulants, heavy smoking, and use of over-the-counter (OTC) cold remedies cause decreased total sleep time
6. Insomnia precipitated by anxiety

#### E Therapeutic interventions

1. Relaxation techniques
2. Sleep hygiene practices (interventions that enhance sleep)
3. Sedative/hypnotic agents (see [Chapter 16](#), The Practice of Mental Health/Psychiatric Nursing, Related Pharmacology: Psychotropic Medications, Sedative and Hypnotic Agents; used judiciously, particularly in older adults; used short-term, not long-term)

## ***Nursing Care of Clients with Sleep Disorders***

### **Assessment/Analysis**

1. History of onset, duration, and sleep patterns
2. Daily routines, night rituals
3. Diet and physical activity
4. Stressors
5. Level of daytime alertness, nap patterns
6. Restless leg movement, snoring
7. Drug, alcohol, caffeine, nicotine use
8. Pharmacologic or herbal remedies
9. Sleep journal

### **Planning/Implementation**

1. Assist with ruling out medical conditions that contribute to sleep-related problems
2. Obtain a diet diary to assess food/liquid intake and caffeine consumption
3. Control physical disturbances at night; provide a private room if necessary
4. Administer prescribed hypnotic
5. Teach sleep hygiene practices
  - a. Establish a daily exercise regimen during the day hours to reduce stress
  - b. Engage in diversional activities during the day to avoid napping
  - c. Eat a larger meal at noon rather than at dinner

- d. Avoid stimulants (e.g., coffee, tea, chocolate, nicotine, and OTC cold remedies) before bedtime
- e. Perform relaxation techniques
- f. Establish set sleep patterns (bedtime and awakening schedule)
- g. Ensure a quiet, restful environment at bedtime
- h. Avoid physical exercise or mental stimulation just before bedtime
- i. Limit bedroom activities to sleep and sex; leave the bedroom if unable to sleep

## Evaluation/Outcomes

- 1. Copes with anxiety-producing situations effectively
- 2. Uses relaxation techniques
- 3. Limits use of stimulants
- 4. Reports restorative sleep
- 5. Reports improved sense of well-being

## Eating Disorders

### Overview

- A Eating behaviors and perceptions of body shape and weight are severely disturbed
- B Anorexia and bulimia nervosa may be present in the same client or exist separately
- C Compulsive overeating, although not currently classified as an eating disorder, is another maladaptive behavior involving eating

### General Nursing Care of Clients with Eating Disorders

- A Recognize that the adolescent or adult requires
  - 1. Basic physiologic and safety needs to be met
  - 2. Acceptance
  - 3. Meaningful relationships
  - 4. Limit setting of manipulative behavior
  - 5. Monitoring during and after mealtime
  - 6. An awareness of type, amount, and patterns of food eaten (food diary)
  - 7. Consultation with nutritionist to determine adequate dietary regimen
- B Provide care for clients with eating disorders
  - 1. Establish a relationship based on trust
  - 2. Promote self-worth
  - 3. Set limits that are realistic
  - 4. Be consistent in approach and in rules and regulations
  - 5. Support and encourage independence
  - 6. Teach more effective ways of coping
  - 7. Encourage participation in individual and family therapy

## Anorexia Nervosa

# **Data Base**

## A Etiologic factors

1. Decreased levels of norepinephrine, serotonin, and dopamine
2. Combination of genetic, neurochemical, developmental, psychologic, social, cultural, and familial factors cited
3. More common in females
4. Avoidance of food may result from excessive concern with obesity
5. Apparent failure to separate from mother and become autonomous; unconscious fear of maturing
6. Onset usually during adolescence through young adulthood; less common in older adults but is increasing in perimenopausal women

## B Behavioral/clinical findings

### 1. Subtypes

- a. Restricting type: weight loss is accomplished through dieting, fasting, or excessive exercise
- b. Binge eating/purging type: weight loss is accomplished through purging (e.g., use of self-induced vomiting and misuse of laxatives, diuretics, or enemas on a weekly basis)

2. Weight less than 85% of expected weight; cachexia
3. Distorted self-image; appear fat to themselves even when emaciated
4. Intense fear of becoming fat, even though underweight
5. May have history of compulsive traits such as rigidity, ritualistic behavior, and meticulousness; need to control or prove control
6. Usually very manipulative
7. Usually high achiever academically
8. Frequent discord in family relationships, especially with mother
9. Often interested in food and cooking in general; serves as a control strategy
10. Cessation of menses for more than 3 months in females (amenorrhea)
11. Inability to sustain self-starvation may result in bulimic episodes (bingeing of food followed by self-induced vomiting)
12. Fatigue or hyperactivity
13. Gastrointestinal (GI) disturbances (e.g., feeling of fullness after small intake, nausea, and constipation)
14. Hypotension; bradycardia
15. Fluid and electrolyte disturbances; dependent edema
16. Low blood glucose level
17. Anemia
18. Sensitivity to cold
19. Erosion of tooth enamel (if vomiting)
20. Lanugo (fine, brittle body hair); dry skin

## C Therapeutic interventions

1. Unified team approach
2. Behavior modification techniques that focus on client's responsibility for weight gain

3. Time limit on meals; monitor client after meals
4. Use of enteral feedings if weight loss is so great or fluid and electrolyte imbalance is so severe that it causes a threat to life
5. Limit on excessive physical activity
6. Psychotherapy focusing on self-image
7. Group and cognitive therapy
8. Family therapy with all members of family involved
9. Gradual increase in calories and protein under guidance of nutritionist
10. Antidepressants are helpful especially with comorbid depression

## ***Nursing Care of Clients with Anorexia Nervosa***

### **Assessment/Analysis**

1. Complete physical and dental examination to rule out associated medical complications of eating disorder; involved systems: central nervous system (CNS), renal, hematologic, GI, endocrine, cardiovascular, and integumentary
2. Weight and height
3. Signs of fluid and electrolyte imbalance
4. History of amenorrhea
5. Indulgence in excessive exercise
6. Behavior reflecting obsessiveness with food
7. History of stringent control of food intake
8. Depressive mood
9. Motivation to change maladaptive eating patterns
10. Heart rate and rhythm

### **Planning/Implementation**

1. See [General Nursing Care of Clients with Eating Disorders](#)
2. Develop a therapeutic environment
3. Establish a behavior modification program
4. Help client identify feelings
5. Briefly discuss dietary modification in a nonthreatening manner
6. Provide diet high in nutrient-dense foods
7. Avoid focusing on eating or weight loss

### **Evaluation/Outcomes**

1. Maintains dietary intake adequate to meet daily caloric requirements
2. Reaches and maintains appropriate body weight
3. Develops realistic body image
4. Identifies and verbalizes feelings
5. Accepts age-appropriate role
6. Resolves separation and individuation issues

# Bulimia Nervosa

## **Data Base**

### A Etiologic factors

1. Most common in adolescent through 30-year-old population
2. More common in females but seen in males who need to maintain low weights (e.g., jockeys, wrestlers, gymnasts, ice skaters)
3. Obesity frequently found in parents or siblings
4. Predisposition to depression
5. Discord in family relationships
6. Obsession with food results from morbid fear of obesity and the pathologic need to binge
7. Purging is an attempt to regain control after binge eating

### B Behavioral/clinical findings

1. Subtypes
  - a. Purging type: engages in purging behaviors that occur at least biweekly for a minimum of 3 months
  - b. Nonpurging type: uses fasting or excessive exercise, not purging
2. Compulsive eating binges characterized by rapid consumption of excessive amounts of high-caloric foods in brief periods; followed by induced purging (e.g., vomiting, enemas, laxatives, diuretics) in the purging subtype
3. Periods of severe dieting or fasting between binges
4. Sporadic vigorous exercising between binges
5. Weight may be within expected range with frequent fluctuations above or below expected range because of alternating binges and fasts
6. Lack of control over eating during episode
7. Depression and self-deprecating thoughts follow binges
8. Extroverted
9. Possible intermittent substance abuse
10. Very concerned with body image and appearance
11. Repeated attempts to control or lose weight

### C Therapeutic interventions

1. See Therapeutic interventions under Anorexia Nervosa, except for the use of an enteral feeding tube
2. Treatment of depression, which is the most frequently observed psychologic concomitant condition associated with bulimia

## **Nursing Care of Clients with Bulimia Nervosa**

## **Assessment/Analysis**

1. Behavior indicative of purging such as self-induced vomiting and use of enemas, laxatives, and/or diuretics
2. Obsession with excessive exercise

3. Pattern and duration of bingeing
4. Undue concern with body weight and shape
5. Physiologic changes such as dental caries, chipped teeth, enlarged parotid glands, calluses or scars on knuckles from induced vomiting
6. Signs of fluid and electrolyte imbalances
7. Weight and height
8. History of consuming tremendous amounts of calories in a short period of time
9. Symptoms of depression or obsessive-compulsive behaviors
10. Substance abuse (drug[s], pattern, duration)

## **Planning/Implementation**

1. See General Nursing Care of Clients with Eating Disorders
2. Provide a nonjudgmental, accepting environment
3. Set realistic limits; keep under close observation to prevent purging
4. Encourage verbalization of feelings
5. Help to identify feelings associated with bingeing and purging
6. Shift focus from food, eating, and exercise to emotional issues
7. Encourage journaling to identify situational and emotional triggers to bingeing

## **Evaluation/Outcomes**

1. Limits dietary intake to caloric requirements
2. Reduces episodes of bingeing
3. Reduces episodes of purging
4. Identifies feelings
5. Verbalizes emotions and needs
6. Reports no depressive symptoms
7. Develops a healthy lifestyle balancing eating and exercise

## **Personality Disorders**

### **Data Base**

#### A Basic information

1. These disorders are extreme exaggerations of personality traits or styles that often define the uniqueness of the individual
2. Under stress, individuals manifest patterns of inflexibility, maladaptive emotional responses, and functioning impairments
3. A personality disorder, according to the DSM-IV-TR, is an “enduring pattern of inner experiences and behavior that deviates markedly from the expectations of the individual’s culture, is pervasive and inflexible, has an onset in adolescence or early adulthood, is stable over time, and leads to distress or impairment”

#### B Etiologic factors

1. Psychodynamic theory postulates that individuals with personality disorders have

deficits in psychosexual development or failure to achieve object constancy

## 2. Neurobiologic perspective

- a. Research evidence suggests that the development of major personality disorders is determined by environmental factors that interact with biologic factors such as inability to tolerate anxiety, aggressiveness, and genetic vulnerability
- b. Family and twin studies demonstrate a strong genetic influence suggesting a connection between biologic factors and personality organization
- c. Study findings suggest a structural brain deficit in antisocial personality disorder that may cause low arousal, low fear, lack of conscience, and deficits in decision making
- d. Further research is needed to clarify the role of inheritance in relation to brain structure and function in the development of personality disorders

## 3. Sociocultural factors (isolation and family instability) influence the ability to establish and maintain relationships

## 4. Relationship problems develop early in life, and often move through predictable stages beginning with idealization and overevaluation and end with rationalization, devaluation, and rejection of other persons

## 5. Premorbid personality of individuals with these disorders resembles the compensatory behaviors associated with the pathologic counterpart

## C Types and behavioral/clinical findings

### 1. Cluster A personality disorders: odd or eccentric behavior

#### a. Paranoid personality disorder

- (1) Frequent use of projective mechanisms
- (2) Suspiciousness, fear, irritability, and stubbornness

#### b. Schizoid personality disorder

- (1) Avoidance of meaningful interpersonal relationships; prefers solitary activities
- (2) Use of autistic thinking, emotional detachment, and daydreaming
- (3) Introverted since childhood but maintains fair contact with reality
- (4) Asexual

#### c. Schizotypal personality disorder

- (1) Unattached, withdrawn
- (2) Affectively and intellectually diminished
- (3) Frequently part of vagabond or transient groups of society
- (4) Behavior or appearance that is eccentric

### 2. Cluster B personality disorders: dramatic behavior

#### a. Antisocial personality disorder

- (1) Chronic lifelong disturbance that conflicts with society's laws and customs
- (2) Inability to postpone gratification; lives only for the moment
- (3) Randomly acts out aggressive egocentric impulses on society
- (4) Does not profit from past experiences or punishment; does not take responsibility for actions and blames others for problems; lacks remorse for unacceptable behavior

(5) Has the ability to ingratiate self with others but eventually wears them down

(6) Is in contact with reality but does not seem to care about it or people

(7) More common in men

b. Borderline personality disorder

(1) Unstable and intense interpersonal relationships

(2) Impulsive, unpredictable behavior that is potentially self-destructive

(3) Marked mood shifts

(4) Intense inappropriate discharge of anger

(5) Black-or-white (splitting) thinking

(6) Unstable sense of self; identity disturbances

(7) Chronic feeling of emptiness

(8) History of parental abuse or neglect in early childhood; sexual abuse by nonparents

(9) More common in women

c. Histrionic personality disorder

(1) Emotional instability and hyperexcitability

(2) Extroverted and directed toward gaining attention

(3) Vain and deliberately manipulative

(4) Theatrical and overreactive

d. Narcissistic personality disorder

(1) Overblown sense of importance

(2) Strong need for attention and admiration

(3) Relationships marked by ambivalence

(4) Preoccupation with appearance

3. Cluster C personality disorders: anxious or fearful behaviors

a. Avoidant personality disorder

(1) Social discomfort and timidity

(2) Loner; unwilling to get involved with others

(3) Fear of negative evaluation from others

b. Dependent personality disorder

(1) Unable to make decisions

(2) Lack of self-confidence

(3) Dependent; submissive

(4) Induces others to assume responsibility

c. Obsessive-compulsive personality disorder

(1) Rigidity, overconscientiousness, inordinate capacity for work

(2) Driven by obsessive concerns

(3) Behavior may contain many rituals that cannot be controlled

4. Unspecified personality disorders

a. Does not meet criteria for a specific personality disorder

b. Generally has features of more than one specific type (mixed disorders)

c. Personality disorders not in the current classification: passive-aggressive

personality, depressive personality

- d. Causes functional impairments that are clinically significant beginning in early adulthood

#### D Therapeutic interventions

1. Individual, group, and family psychotherapy
2. Crisis intervention when necessary
3. Vocational and occupational therapy
4. Psychotropic drugs, but they have a limited role
5. Dialectical behavioral therapy: the use of dialogue to help the client learn new patterns of thoughts and behavior

## ***Nursing Care of Clients with Personality Disorders***

### **Assessment/Analysis**

1. Level of social and occupational functioning
2. Individual's perception of problem
3. Reason for seeking treatment
4. Level of anxiety
5. Pending criminal charges
6. Drug and alcohol abuse
7. History of suicidal gestures and present risk

### **Planning/Implementation**

1. Maintain consistency, concern, and a professional relationship
2. Accept the individual as is; do not retaliate if provoked; manage countertransference
3. Protect the individual from others while protecting others from the individual
4. Place realistic limits on behavior; make known what those limits are
5. Strive for consistency among health team members; avoid splitting of staff
6. Initiate cognitive, behavioral and dialectic behavioral strategies

### **Evaluation/Outcomes**

1. Demonstrates decreased episodes of acting out
2. Verbalizes decrease in anxiety
3. Accepts and continues long-term therapy
4. Recognizes and functions within limits of personality

## **Adjustment Disorders**

### ***Data Base***

A Etiologic factors

1. These disorders are characterized by a short-term disturbance in mood or behavior with nonpsychotic manifestations resulting from identifiable stressors

2. Severity of the reaction is not proportionate to the severity of stressors
3. Problematic response to life events, either developmental or situational
4. Interaction of personality, crisis, developmental factors, and cultural influences
5. No apparent underlying mental disorder, but there may be low self-esteem and present behavior may be extremely disturbed
6. Exhibits capacity to adapt to overwhelming stress when given the time to do so
7. Problems with distortions or interruptions in thinking processes and decision making tend to resolve themselves

#### B Behavioral/clinical findings

1. Infancy: extremely upset; demonstrating grief when separated from mother
2. Childhood: regression to an earlier level of development when a new sibling arrives; intense anxiety on entering school
3. Adolescence: struggle for independence; leads to hypersensitivity and frequent episodes of heightened anxiety
4. Adult life: heightened anxiety in response to stressors associated with events such as marriage, pregnancy, divorce, change of employment, purchase of a house
5. Later life: menopause and climacteric, "loss" of children to marriage, retirement, and death of a mate produce extreme stress
6. Onset begins within 3 months of stressors
7. Significant impairment in social and occupational functioning
8. Duration of disorder lasts no longer than 6 months after stress ceases
9. Onset may occur at any age; commonly noted in children and adolescents

#### C Therapeutic interventions

See [Chapter 19](#), Panic Disorder, Data Base

## ***Nursing Care of Clients with Adjustment Disorders***

### **Assessment/Analysis**

1. Individual's perception of problem
2. Factors impinging on current situation
3. Individual's personal strengths and support systems
4. Level of anxiety
5. Identification of type(s) of stressors and onset

### **Planning/Implementation**

1. Help client and/or parents recognize and accept that a problem exists
2. Maintain client safety
3. Encourage identification and use of support systems
4. Attempt to minimize environmental pressures
5. Allow the client time to recover personal resources

### **Evaluation/Outcomes**

1. Reorganizes defenses
2. Utilizes support systems
3. Verbalizes a decrease in anxiety
4. Develops more effective coping

## Substance Abuse and Dependency

### Overview

A Substance refers to any mind-altering chemical

B Substance abuse: maladaptive pattern of drug use leading to impairment or distress, as manifested by one or more of the following occurring within a 12-month period

1. Failure to fulfill major roles
2. Use in hazardous situations
3. Recurring related legal problems
4. Continued use despite social or interpersonal problems

C Although not currently classified as addiction diagnoses in the DSM-IV-TR, behaviors such as compulsive gambling, compulsive sexual activity, and compulsive overeating are now being treated as addictive disorders

D Substance intoxication: a reversible substance-specific syndrome caused by recent ingestion of, or exposure to, a substance resulting in maladaptive behavior or psychologic changes from effect on the CNS

E Substance withdrawal: development of a substance-specific syndrome resulting from cessation or reduction in substance use that has been heavy or prolonged

1. Impairment in role functioning (e.g., social, school, or occupational)
2. Symptoms are not associated with another mental disorder
3. Substance withdrawal is more risky with drugs that are CNS depressants or have a short half-life (e.g., alcohol) than those with a long half-life (e.g., marijuana); withdrawal is not lethal with some (e.g., cocaine)
4. Withdrawal may cause more problems in older adults because they possess less physiological reserves

F Substance tolerance: the need for greatly increased amounts of the substance to achieve the desired effects or a markedly diminished effect with the continued use of the same amount of substance; substance tolerance does not occur with all substances

G Polysubstance abuse: abuse of three or more drugs or of alcohol and drugs

H Potentiation: two or more substances interact in the body to produce an effect greater than the sum of the effects of each substance taken alone

I Substance dependence: the continued use of a substance despite significant related problems in cognitive, physiologic, and behavioral components; spending more time in getting, taking, and recovering from the substance; continuous abuse despite knowledge of physical or psychologic problems or awareness of complications resulting from continued use of the substance; dependency can be both psychological (needed to enhance coping) and physiological (discontinuance results in withdrawal signs and symptoms)

# Alcohol Abuse and Dependency

## **Data Base**

### A Etiologic factors

1. Affects neurotransmitters causing depression of major brain functions (e.g., mood, cognition, attention, concentration, insight, judgment, memory, affect)
2. Is dose-dependent and ranges from lethargy, unconsciousness, coma, respiratory distress, to death
3. Causation theories range from genetic, stress, or environmental factors to interpersonal factors; none fully explains causation
4. Neurobiologic perspective
  - a. Biologic and genetic theories continue to be researched
  - b. Some researchers subscribe to single genetic transmission; others think that complex genetic factors are involved
  - c. Biologic differences in the response to alcohol may influence susceptibility

### B Behavioral/clinical findings

1. Warning signs of alcoholism: frequent drinking sprees, increased intake, drinking alone or in the early morning, blackouts
2. Intoxication: state in which coordination or speech is impaired and behavior is altered
3. Episodic excessive drinking: becoming intoxicated as infrequently as four times a year; episodes may vary in length from hours to days or weeks; may be called binge drinking
4. Habitual excessive drinking: becoming intoxicated more than 12 times a year or being recognizably under the influence of alcohol more than once a week even though not considered intoxicated
5. Defense mechanisms of rationalization and denial are often used; may fill in gaps in memory with fabricated information (confabulation)
6. Alcohol dependence: cessation of drinking results in signs and symptoms of withdrawal (e.g., nausea, vomiting, tremor, paroxysmal sweats, anxiety, agitation, headache, impaired orientation/clouding of sensorium, and tactile, auditory, and visual disturbances)
7. Chronic excessive alcohol consumption leads to multisystem physiologic impairments, including cardiomyopathy, peripheral neuropathy, blackouts, Wernicke encephalopathy, and Korsakoff syndrome
8. Alcohol withdrawal delirium: occurs on days 2 and 3 but may appear as late as 14 days after the last drink; confusion, disorientation, hallucinations, tachycardia, hypertension/hypotension, tremors, agitation, diaphoresis, fever

### C Therapeutic interventions

1. Should be multifaceted (social and medical); involves psychotherapy (e.g., group, family, and individual counseling); clients can be assisted only when they admit they need help
2. Self-help groups such as Alcoholics Anonymous provide support; most effective intervention to change destructive behaviors
3. Pharmacologic therapies

- a. Benzodiazepines during alcohol withdrawal to help prevent seizures and decrease vital signs
  - b. Negative conditioning with disulfiram (Antabuse) appears to help but never given without the client's full knowledge, understanding, and consent; the drug interferes with the metabolism of alcohol and causes significant negative physiological effects (e.g., headache, nausea, dyspnea) if the person drinks after taking the medication
  - c. Naltrexone (ReVia, Vivitrol) to help overcome the craving for alcohol and decrease the euphoria of intoxication
  - d. Thiamine to support neurologic functioning and limit peripheral neuropathies
4. Relaxation therapy
  5. Physical needs must be met because of prolonged malnutrition
  6. Referral of significant others to self-help groups such as Al-Anon and Adult Children of Alcoholics to assist with the understanding of the effects of alcoholism and issues of codependency and enabling

## Nursing Care of Clients Who Abuse Alcohol

### Assessment/Analysis

1. History of alcohol use, abuse, and dependence from client and family if available (e.g., type, amount, and frequency)
2. Use of the CAGE questionnaire
  - a. Have you ever felt that you ought to Cut down on your drinking?
  - b. Have people Annoyed you by criticizing your drinking?
  - c. Have you ever felt Guilty about your drinking?
  - d. Have you ever had a drink first thing in the morning (Eye opener) to steady your nerves or get rid of a hangover?
3. Blood alcohol level (BAL) also called blood alcohol concentration (BAC); people with high tolerance to alcohol will appear less intoxicated despite having elevated blood alcohol levels (Table 20-1: Effects of Blood Alcohol Levels)

---

**Table 20-1**  
**Effects of Blood Alcohol Levels**

---

Blood Alcohol Level	Effect on Body
0.02	Slight mood changes
0.06	Lowered inhibition, impaired judgment, decreased rational decision-making abilities
0.08	Legally drunk, deterioration of reaction time and control
0.15	Impaired balance, movement, and coordination Difficulty standing, walking, talking
0.20	Decreased pain and sensation Erratic emotions
0.30	Diminished reflexes Semiconsciousness
0.40	Loss of consciousness Very limited reflexes Anesthetic effects
0.50	Death

- 4. Data pertaining to substance dependence and psychiatric impairment
- 5. Client’s perception of the problem
- 6. Sleep patterns
- 7. Use of the Clinical Institute Withdrawal Assessment for Alcohol (CIWA-Ar) Scale to assess withdrawal and evaluate medication used to limit withdrawal symptoms ([Table 20-2: Clinical Institute Withdrawal Assessment for Alcohol \[CIWA-Ar\] Scale](#))

**Table 20-2**  
**Clinical Institute Withdrawal Assessment for Alcohol [CIWA-Ar] Scale**

Nausea and vomiting	None to constant nausea Frequent dry heaves Vomiting
Tremors	None to severe
Paroxysmal sweats	None to drenching sweats
Anxiety	None to equivalent to acute panic states
Agitation	None to pacing back and forth constantly Thrashing about
Tactile disturbances	None to continuous tactile hallucinations (itching, burning, numbness)
Auditory disturbances	None to continuous auditory hallucinations
Visual disturbances	None to continuous visual hallucinations
Headache	None to extremely severe
Orientation	Oriented to disoriented to place and/or person

Modified from Sullivan JT, Sykora K, Schneiderman J et al: Assessment of alcohol withdrawal: the revised Clinical Institute Withdrawal Assessment for Alcohol Scale (CIWA-Ar). *Br J Addict* 84:1353-1357, 1989.

8. Physical and emotional status in relation to nutrition, fluid and electrolytes, and safety
9. Factors influencing the client's decision to seek treatment at this time

## Planning/Implementation

1. Supervise and prevent injury; institute seizure precautions during withdrawal
2. Monitor for CNS and respiratory depression if intoxicated
3. Provide support without criticism or judgment
4. Accept the smooth facade presented while approaching the lonely and fearful individual inside
5. Administer prescribed medications that support nutritional status and limit signs and symptoms of withdrawal
6. Provide support during alcohol withdrawal delirium
7. Provide support if hallucinations and illusions occur; stay with client; point out reality
8. Monitor visitors because they may supply the client with alcohol
9. Encourage increased fluid intake, well-balanced diet, and no caffeine
10. Provide a well-controlled, alcohol-free environment; explain unit routines
11. Plan a full program of activities but provide for adequate rest; environment should be well lit and quiet
12. Avoid attempting to talk client out of the problem or making client feel guilty
13. Accept hostility and acting-out behaviors without criticism or retaliation; set appropriate limits if hostility is physical or escalates

14. Recognize ambivalence and limit the need for decision making
15. Maintain the client's interest in a therapy program
16. Provide education on alcohol as a disease with negative effects on physical and mental health
17. Refer to an appropriate 12-step group such as Alcoholics Anonymous
18. Expect and accept lapses as client is changing a long-term habit; accept failures without judgment or punishment; teach how to handle relapses
19. Provide family counseling and refer to self-help groups to address effects of drinking and sobriety on the family

## **Evaluation/Outcomes**

1. Recognizes, accepts, and seeks treatment for problem
2. Accepts responsibility for problem without blaming others
3. Achieves optimal physiologic and nutritional status
4. Learns new, more self-preserving coping mechanisms
5. Verbalizes feelings and situations that pose increased risk for alcohol use
6. Enters into and continues with community-based self-help program
7. Maintains abstinence from alcohol and chemical substances
8. Demonstrates responsibility in meeting own health care needs

## **Drug Abuse**

### **Data Base**

#### A Etiologic factors

1. Misuse of drugs, usually by self-administration, in such a way as to bring about physical, emotional, or behavioral changes and a blurring of reality
2. In addition to illegal drugs, many prescription drugs such as narcotic analgesics and antianxiety agents may be abused
3. Premorbid addictive personality; addictive patterns of behavior

B Addictive capacity depends on the drug, from lowest potential to highest potential (e.g., progressing from codeine, alcohol, and barbiturates to heroin); concurrent use of multiple drugs (polysubstance use) including alcohol

#### C Behavioral/clinical findings

1. Physical examination reflects type of drug used and route of delivery
2. Job or academic failure; marital conflicts; poor reality testing; personality change
3. History of violent acting out with disregard for human life or suffering
4. History of stealing, selling drugs, and prostitution
5. Inability to maintain activities of daily living or fulfill role obligations
6. Marked tolerance for some drugs such as opioids and cocaine with a progressive need for higher doses to achieve desired effect
7. Opioids: heroin, Hycodan (Oxy-Contin), hydrocodone (Hycodon), fentanyl (Sublimaze)
  - a. Use: constricted pupils, drowsiness, euphoria, slurred speech, psychomotor

retardation; needle marks (track marks), particularly on limbs or between toes, which can lead to infections (e.g., endocarditis, hepatitis, or human immunodeficiency virus [HIV]); wearing long-sleeved shirts, even in warm weather

b. Overdose: respiratory depression, bradycardia, death

c. Withdrawal: yawning, lacrimation, rhinorrhea, and perspiration appear 10 to 15 hours after last opioid injection; unrealistic high; pronounced depression; severe abdominal cramps, nausea and vomiting if too much time has elapsed between doses

8. Stimulants: cocaine, amphetamines, attention deficit hyperactivity disorder (ADHD) stimulant medications

a. Use: hypervigilance, increased sexual activity, hyperactivity, dilated pupils, euphoria, anorexia and thirst; snorting leads to nasal septum destruction, hoarseness, and throat infections

b. Overdose: cardiac dysrhythmias, seizures, hypertension, paranoid ideation, psychosis with hallucinations

c. Withdrawal: marked emotional and physical letdown with progression to severe depression and paranoia

9. CNS depressants (other than alcohol): barbiturates, antianxiety agents, hypnotics use, overdose, and withdrawal are similar to that of alcohol

10. Hallucinogens: lysergic acid diethylamide (LSD), phencyclidine (PCP), mescaline

a. Use: euphoria, visual hallucinations, disorientation, tachycardia, anxiety

b. Extreme use: agitation, psychosis, violence, seizures

c. Withdrawal: no symptoms; however, flashbacks of hallucinations and other symptoms of use can occur even after periods of abstinence

11. Inhalants: aromatic hydrocarbons found in aerosol propellants, solvents, glues

a. Use: apathy; aggressiveness; lethargy; ataxia; euphoria; dizziness; irritation of eyes, nose, throat and lungs; liver damage

b. Extreme use: depressed reflexes, respiratory compromise, coma

c. Withdrawal: no symptoms

12. Cannabis: marijuana, hashish

a. Use: euphoria, anxiety, paranoia, restlessness, talkativeness, increased appetite

b. Overdose: hallucinations

c. Withdrawal: restlessness, irritability, decreased appetite, insomnia

13. Techno/club drugs (recreational drugs): methylenedioxymethamphetamine (MDMA, ecstasy) and ketamine resemble effects of amphetamine; flunitrazepam (Rohypnol)

a. Use: sleep disorders, depression, high anxiety levels, hostility, and impulsiveness; sexual assault/rape drug (flunitrazepam) produces disinhibition and voluntary muscle relaxation along with anterograde amnesia; alcohol potentiates the effects

b. Extreme use: dehydration, hyperthermia, acute renal failure, psychosis cardiovascular collapse

c. Withdrawal: no symptoms

D Therapeutic interventions

1. Treatment for drug overdose
  - a. Opioid antagonists
    - (1) Naloxone, an opioid antagonist, improves respiratory rate, although it may not affect level of consciousness; respiratory depression can recur when the drug is metabolized before the opioid has been metabolized to a safe level
    - (2) This antagonist completely or partially reverses opioid depression and may produce an acute abstinence (withdrawal) syndrome by blocking euphoric and physiologic effects of the opioid
  - b. Gastric lavage may be necessary if substance was taken orally within the past several hours
2. Treatment for withdrawal symptoms
  - a. Antidepressants seem to block the “high” from stimulant abuse and diminish the craving for the substance
  - b. Clonidine (Catapres) suppresses opioid withdrawal signs and symptoms and decreases adrenergic excess while opioid receptors return to normal levels
    - (1) Heroin addicts who are first stabilized on methadone before detoxification respond better than those who go directly from heroin to clonidine
    - (2) Clonidine should not be used in those individuals who also abuse alcohol or those who have unstable psychiatric or cardiovascular conditions
3. Methadone maintenance for opioid dependence: programs change the dependence from an illegal drug to a legal drug, which is administered under supervision; has proven successful only in individuals with long-standing addictions
  - a. Reduction in dosage can cause withdrawal signs and symptoms
  - b. Withdrawal signs and symptoms begin to develop in 8 hours and may last as long as 2 weeks
  - c. Approved for treatment of pregnant opioid addicts
  - d. Levomethadyl acetate (Orlaam) is an alternative to methadone; its 3-day effectiveness increases independence; it is an addictive opioid with effects similar to morphine
4. High-calorie, high-protein diet with vitamin supplements
5. Treatment in groups led by former addicts
6. Therapeutic community setting
7. Psychotherapy and family therapy on an outpatient basis
8. Vocational counseling

## ***Nursing Care of Clients Who Abuse Drugs***

### **Assessment/Analysis**

1. History of drugs being used (e.g., types, amount, and frequency)
2. Urine toxicology screen and HIV testing
3. Drug abuse screening test
4. History of length and pattern of drug dependence
5. Time since last dose was taken

6. Physical status of the client for signs and symptoms of drug dependence; nutritional status
7. Signs of drug overdose or withdrawal; use of established scales (e.g., Clinical Institute Narcotic Assessment [CINA] Scale or Clinical Opiate Withdrawal Scale [COWS]) to help with completeness and consistency of assessment
8. Degree of difficulty sustaining role in relation to family members, job, school, etc.
9. Why client is seeking treatment at this time
10. Pending criminal charges
11. Potential for violence toward others or self
12. Presence of hallucinations, paranoid ideation, and depression
13. Relationship between substance use and psychiatric disorders (known as dual diagnosis)
14. Potential for recurrence of drug abuse after period of withdrawal

## **Planning/Implementation**

1. Maintain drug-free environment when hospitalized
2. Keep atmosphere pleasant and cheerful but not overly stimulating
3. Contribute to the client's self-confidence, self-respect, and security in a realistic manner; focus on feelings
4. Expect and accept evasion, manipulative behavior, and negativism, but require the maintenance of standards of responsibility; set realistic limits
5. Accept client without approving the behavior
6. Do not permit client to become isolated
7. Introduce to group activities as soon as possible; evaluate response to group interaction
8. Protect client from self and others
9. Refer to appropriate 12-step group such as Cocaine Anonymous and Narcotics Anonymous
10. Treat physical effects of substance abuse
11. Provide education related to the disease process and health effects

## **Evaluation/Outcomes**

1. Recognizes, accepts, and seeks treatment for problem
2. Accepts responsibility for problem without blaming others
3. Achieves optimal physiologic and nutritional status
4. Learns new, more self-preserving coping mechanisms
5. Verbalizes feelings and emotions
6. Enters into and continues with community-based self-help program
7. Abstains from all mood-altering chemicals

## **Factitious Disorders**

### **Data Base**

A The DSM-IV-TR does not classify specific factitious disorders, but falling within this category are

1. Malingering: making a conscious attempt to deceive others by pretending to be sick
2. Munchausen syndrome: intentionally causing own illness; this may involve self-mutilation, fever, hemorrhage, hypoglycemia, seizures, nonhealing wounds, and abdominal or back pain
3. Munchausen syndrome by proxy: parent creates an illness in the child through simulation or production of illness; frequent symptoms include bleeding, seizures, apnea, diarrhea, vomiting, fever, and rash

B Etiologic factors

1. Manipulation of the health care system for personal gain
2. No identifiable predisposing factor
3. Health care knowledge may be used to aid in deception

C Behavioral/clinical findings

1. Physical or psychologic symptoms are intentionally produced or feigned to enable one to assume the sick role and for other secondary gains; reports of back pain and recurrent headaches are most common
2. "Doctor shopping," seeking treatment in multiple emergency departments; little or no improvement is made in comfort or symptom management after treatment
3. Must be distinguished from a true medical condition through a medical diagnostic workup
4. When under supervision of other caretakers the child who is abused by Munchausen syndrome by proxy exhibits no symptoms

D Therapeutic interventions

1. Psychiatric treatment
2. Supervision of child who is victim of Munchausen syndrome by proxy
3. Munchausen syndrome by proxy reported to child protective services

## ***Nursing Care of Clients with Factitious Disorders***

### **Assessment/Analysis**

1. Level of preoccupation with symptoms that keep recurring despite treatment
2. Absence of symptoms when client is closely observed
3. Past and present degree of interference with functioning related to symptoms
4. Duration and degree of disability associated with symptoms
5. History of psychosocial stressors

### **Planning/Implementation**

1. Report suspected Munchausen syndrome by proxy to child protective services
2. Recognize negative feelings toward the client; remain nonjudgmental while establishing nurse-client relationship
3. Keep lines of communication open and direct

4. See [Chapter 19](#), Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood, General Nursing Care for Clients with Somatoform Disorders

## **Evaluation/Outcomes**

1. Uses more effective coping mechanisms to cope with anxiety than feigning illness
2. Accepts need for psychotherapy
3. Avoids causing harm to self or others

## CHAPTER 21

# Nursing Care of Clients with Sexual and Gender Identity Disorders

---

# Overview

A Changing social and cultural mores have removed many of the sexual behaviors that were once considered deviations from the list of “abnormal practices”

B Today sexual activities are considered abnormal only if they are directed toward anyone or anything other than consenting adults or are performed under unusual circumstances

C Sexual needs are basic human needs

# General Nursing Care of Clients with Sexual and Gender Identity Disorders

- A Reflect on own sexual values and mores
- B Accept individual as a person in emotional pain
- C Create a safe, nonjudgmental environment that permits open communication
- D Begin with less sensitive topics and move gradually to more personal issues
- E Avoid punitive or judgmental remarks or responses; maintain a matter-of-fact manner
- F Provide for privacy and protect individual from others
- G Set limits on sexual acting out behavior
- H Report suspected child or elder abuse to appropriate protective service agencies

# Major Disorders Associated with Sexual and Gender Identity Conditions

## Paraphilias

### ***Data Base***

#### A Etiologic factors

1. Paraphilias: sexual urges or fantasies that are directed toward nonhuman objects or infliction of pain to self, partner, children, or other nonconsenting individuals
2. Concurrent overt or covert emotional problems
3. Behavior continues for at least 6 months

#### B Behavioral/clinical findings are based on type of paraphilia

1. Exhibitionism: sexual pleasure by exposing the genitals
2. Pedophilia: attraction to children as sex objects; acting on impulses results in child abuse
3. Voyeurism: sexual gratification by watching sexual play of others
4. Sadism: sexual gratification through cruelty to others; acting on impulses may result in abuse of vulnerable person (e.g., child, older adult, significant other)
5. Masochism: sexual gratification obtained from self-suffering

#### C Therapeutic interventions

1. Successful only if there is motivation to change
2. Cognitive and behavioral therapy may be effective if change is desired

### ***Nursing Care of Clients with Paraphilias***

#### **Assessment/Analysis**

1. History of sexual behavior
2. Presence of other psychosocial difficulties
3. Level of anxiety regarding sexual behavior
4. Potential for violence toward others or self
5. Reason for seeking treatment
6. Pending criminal charges

#### **Planning/Implementation**

See [General Nursing Care for Clients with Sexual and Gender Identity Disorders](#)

#### **Evaluation/Outcomes**

1. Ceases socially unacceptable behavior
2. Seeks and continues long-term therapy
3. Limits paraphiliac behavior to consenting adults
4. Uses safer sex practices

# Sexual Dysfunction

## **Data Base**

### A Etiologic factors

1. Inhibition or interference with the desire, excitement, orgasm, or resolution phases of the sexual response cycle
2. Often a combination of psychogenic and physiologic factors
3. Can be lifelong or acquired
4. Can be generalized or situational

### B Types and behavioral/clinical findings

1. Sexual desire disorders: deficient, absent, or extreme aversion to and avoidance of sexual activity
2. Sexual arousal disorders: partial or complete failure to achieve a physiologic or psychologic (subjective) response to sexual activity
3. Orgasm disorders: delay in or absence of orgasm, premature ejaculation
4. Sexual pain disorders: recurrent or persistent genital pain before, during, or after sexual activity (dyspareunia)

### C Therapeutic interventions

1. Treatment of underlying physiologic cause if present
2. Sexual counseling for client and partner
3. Vacuum constriction device for males
4. Pharmacologic therapy: sildenafil (Viagra), tadalafil (Cialis), alprostadil (Muse, Caverject)
5. Surgical intervention: semirigid or inflatable penile prosthesis

## **Nursing Care of Clients with Sexual Dysfunction**

### **Assessment/Analysis**

1. Feelings about difficulties in functioning sexually
2. Expectations regarding sexual ability
3. Effect of sexual dysfunction on sexual relationship(s)

### **Planning/Implementation**

1. See [General Nursing Care for Clients with Sexual and Gender Identity Disorders](#)
2. Accept that problem is real to client regardless of age
3. Accept that desire to function sexually does not diminish with age
4. Teach how to support/promote an erection (e.g., avoid alcohol, recreational drug use, sedatives/hypnotics); use penile vacuum constrictive device
5. Teach side effects of erectile agents (e.g., sildenafil [Viagra] tadalafil [Cialis]): headache, flushing, dizziness, hypotension, diarrhea, dyspepsia, prolonged erection; avoid concurrent use with nitroglycerin because it can cause cardiovascular collapse

## Evaluation/Outcomes

1. Reports an increased satisfaction in sexual functioning
2. Reports sexual ability approaches sexual expectations

## Gender Identity Disorders

### ***Data Base***

#### A Etiologic factors

1. Origins are unknown
2. Most children are firmly committed to gender role expectations as early as 18 months

#### B Behavioral/clinical findings

1. Persistent discomfort with one's assigned gender and a feeling that it is inappropriate or inaccurate
2. Persistent preference for cross-sex roles
3. Cross-dressing

#### C Therapeutic interventions

1. Individual and/or group psychotherapy
2. Pharmacologic therapy: anxiolytics, antidepressants (see [Chapter 16, The Practice of Mental Health/Psychiatric Nursing, Related Pharmacology, Antianxiety/Anxiolytic Medications and Antidepressants](#))
3. Monitoring of children/adolescents over an extended period of time to aid in diagnosis and treatment
4. Surgical sex reassignment and hormone therapy

### ***Nursing Care of Clients with Gender Identity Disorders***

## Assessment/Analysis

1. Distress about assigned sex role
2. Behaviors, social habits, and cross-dressing inappropriate for sexual gender
3. Preoccupation with becoming, being, or behaving like a person of the opposite sex
4. History of sexual orientation (e.g., asexual, homosexual, bisexual, heterosexual)
5. Presence of depressive behaviors and suicidal ideation

## Planning/Implementation

1. See [General Nursing Care for Clients with Sexual and Gender Identity Disorders](#)
2. Accept own feelings about client's cross-dressing
3. Accept client's discomfort with gender
4. Encourage to become involved with support groups
5. Monitor risk for depression, self-mutilation, and suicide
6. Assist to arrive at a solution (e.g., acceptance, suppression, surgical sex reassignment)

## Evaluation/Outcomes

1. Verbalizes increased comfort with self
2. Accepts assigned gender, lives as the opposite sex, and/or explores surgical options
3. Participates in support group

## CHAPTER 22

# Mental Health/Psychiatric Nursing

---

## Review Questions with Answers and Rationales

### Questions

---

**Note:** Thousands of additional practice questions are available on the enclosed companion CD.

▶ Denotes alternate format question.

# Foundations of Mental Health/Psychiatric Nursing

1. At what age does Freud's phallic stage of psychosexual development compare with Erikson's psychosocial phase of initiative versus guilt?

1. Adolescence
2. 6 to 12 years
3. 3 to  $5\frac{1}{2}$  years
4. Birth to 1 year

2. Which relationship is of **most** concern to the nurse because of its importance in the formation of the personality?

1. Peer
2. Sibling
3. Spousal
4. Parent-child

3. A nurse concludes that a client is using displacement. Which behavior has the nurse identified?

1. Ignoring unpleasant aspects of reality
2. Resisting any demands made by others
3. Using imaginative activity to escape reality
4. Directing pent-up emotions to other than the primary source

4. In the process of development the individual strives to maintain, protect, and enhance the integrity of the self. The nurse determines that this usually is accomplished through the use of:

1. affective reactions.
2. withdrawal patterns.
3. ritualistic behaviors.
4. defense mechanisms.

5. A client diagnosed with major depression tells a nurse, "No matter what I do, everything turns out bad." The nurse concludes that this is an example of:

1. using a cognitive distortion.
2. seeking sympathy from the nurse.
3. regressing to an earlier developmental level.
4. avoiding responsibility for previous behavior.

6. A male college student who is smaller than average and unable to participate in sports becomes the life of the party and a stylish dresser. What defense mechanism should the nurse determine that the client is using?

1. Introjection
2. Sublimation
3. Compensation
4. Reaction formation

7. A staff member tells a nurse that an older client gets irritable when asked to assist with activities of daily living. On what general information about older adults should the nurse base a response?

1. Decreased ability to cope
  2. Loss of ability to cooperate
  3. Ambivalence toward authority
  4. Difficulty performing step procedures
8. The parents of a toddler who was recently diagnosed with moderate retardation discuss their child's future independent functioning. What should the nurse conclude?
1. They accept the child's diagnosis.
  2. Denial is being used as a defense.
  3. They want to explore their child's limitations.
  4. Intellectualization helps them put the diagnosis into perspective.
9. On which generally accepted concept of personality development should a nurse base care?
1. By 2 years of age the personality is firmly set.
  2. The personality is capable of modification throughout life.
  3. The capacity for personality change decreases rapidly after adolescence.
  4. By the end of the first 6 years of life the personality has reached its adult parameters.
10. A 6-year-old child is diagnosed with type 1 diabetes. Considering the child's cognitive developmental level, which explanation of the illness is **most** appropriate?
1. "Diabetes is caused by not having any insulin in your body."
  2. "Diabetes will require you to take insulin shots for the rest of your life."
  3. "You will be taught how to give yourself insulin now that you have diabetes."
  4. "Taking insulin for your diabetes is like getting new batteries for your superhero toys."
11. Which individual is coping with issues concerning dependence versus independence?
1. Infant
  2. Toddler
  3. School-age child
  4. Preschool-age child
- 12. A 17-year-old teenager is diagnosed with leukemia. Which statements by the teenager reflect Piaget's cognitive processes associated with adolescence? **Select all that apply.**
1. "My smoking pot probably caused the leukemia."
  2. "I'm going to do my best to fight this terrible disease."
  3. "Now I can't go to the prom because I have this stupid illness."
  4. "I know I got sick because I've been causing a lot of problems at home."
  5. "This illness is serious, but with treatment I think I will have a chance to get better."
13. A person mowing the lawn is badly disfigured by the lawn mower blade. According to Erikson's theory, which age will demonstrate the greatest risk of longer-term psychological effects?
1. 11-year-old
  2. 35-year-old
  3. 55-year-old
  4. 70-year-old
14. A nurse is interviewing an 8-year-old girl who was admitted to the pediatric unit.

Which statement by the child needs to be explored?

1. "Wow! This place has bright colors."
2. "Is my mother allowed to visit me tonight?"
3. "Those boys are so cute. I hope their room is next to mine!"
4. "I am scared about being here. Can you stay with me awhile?"

15. A nurse must consider a child's cognitive level of development when providing preoperative teaching. At which stage of Piaget's cognitive theory should the nurse anticipate a child will experience the greatest fear of surgery?

1. Sensorimotor
2. Preoperational
3. Formal operational
4. Concrete operational

16. After a child's visit to a health care provider, a parent tells the nurse, "I am very upset. An antidepressant was prescribed for my child." What is the nurse's **best** response?

1. "Tell me more about what's bothering you."
2. "Weren't you told why your child needs an antidepressant?"
3. "You need to speak with the health care provider about your concern."
4. "Are you sure it's an antidepressant and not a drug for attention deficit disorder?"

17. A nurse greets a client who had been experiencing delusions of persecution and auditory hallucinations by saying, "Good evening. How are you?" The client, who has been referring to himself as "man," answers, "The man is bad." Of what is this an example?

1. Dissociation
2. Transference
3. Displacement
4. Identification

18. A client with a diagnosis of borderline personality disorder has negative feelings toward the other clients on the unit and considers them all to be "bad." Which defense was the client using when this statement was made?

1. Splitting
2. Ambivalence
3. Passive aggression
4. Reaction formation

19. In response to a question posed during a group meeting, the nurse explains that the superego is that part of the self that says:

1. "I like what I want."
2. "I want what I want."
3. "I should not want that."
4. "I can wait for what I want."

20. Incidents of child molestation often are revealed years later when the victim is an adult. Which defense mechanism reflects this situation?

1. Isolation

2. Repression
  3. Regression
  4. Introjection
21. A client with diabetes mellitus is able to discuss in detail the diabetic metabolic process while eating a piece of chocolate cake. What defense mechanism does the nurse identify when evaluating this behavior?
1. Projection
  2. Dissociation
  3. Displacement
  4. Intellectualization
22. An older adult tells the nurse, "I regret many of the choices I have made during my life." Which of Erikson's developmental conflicts does the nurse identify that the client has probably failed to accomplish?
1. Ego integrity versus despair
  2. Identity versus role confusion
  3. Generativity versus stagnation
  4. Autonomy versus shame and doubt
23. A client states, "I get down on myself when I make a mistake." When a cognitive therapy approach is used, which nursing interventions are **most** appropriate? **Select all that apply.**
1. Teaching the client relaxation exercises to diminish stress
  2. Exploring with the client past experiences that caused distress
  3. Providing the client with mastery experiences to boost self-esteem
  4. Encouraging the client to replace negative thoughts with positive thoughts
  5. Helping the client to modify the belief that anything less than perfection is unacceptable
24. A psychiatric unit uses a behavioral approach to determine a client's level of privileges. Which factor should a nurse use to determine an increase in privileges?
1. Statements that the depression is lifting
  2. An improvement in short-term memory
  3. Performing hygiene activities independently
  4. Verbalizing a desire to change the response to stress
25. A nurse is teaching a class about child abuse. What defense mechanism **most** often used by the physically abusive individual should the nurse include?
1. Repression
  2. Transference
  3. Manipulation
  4. Displacement
26. A nurse is planning to teach a client about self-care. What level of anxiety will **best** enhance the client's learning abilities?
1. Mild
  2. Panic
  3. Severe

4. Moderate

27. A client is scheduled for several diagnostic studies. Which behavior **best** indicates to the nurse that the client has received adequate preparation?

1. Requests that the tests be reexplained
2. Checks the appointment card repeatedly
3. Arrives early and waits quietly to be called for the tests
4. Paces up and down the hallway the morning of the tests

28. Before discharge of an anxious client, the nurse should teach the family that anxiety can be recognized as:

1. a totally unique feeling.
2. fears specifically related to the total environment.
3. consciously motivated actions, thoughts, and wishes.
4. a pattern of emotional and behavioral responses to stress.

29. What should a nurse conclude that a client is doing when using the defense mechanism of sublimation?

1. Acting out in reverse something already done or thought
2. Returning to an earlier, less mature stage of development
3. Channeling unacceptable impulses into socially approved behavior
4. Excluding from consciousness thoughts that are psychologically disturbing

# The Practice of Mental Health/Psychiatric Nursing

30. Among members of the nursing team, which functions are registered nurses legally permitted to perform in a mental health hospital? **Select all that apply.**
1. Psychotherapy
  2. Health promotion
  3. Case management
  4. Prescribing medication
  5. Treating human responses
31. A health care provider orders "Restraints prn" for a client who has a history of violent behavior. What is the nurse's responsibility concerning this order?
1. Ask that the order indicate the type of restraint.
  2. Recognize that prn orders for restraints are unacceptable.
  3. Implement the restraint order when the client begins to act out.
  4. Ensure that the entire staff is aware of the order for the restraint.
32. A client on the psychiatric unit asks a nurse about psychiatric advance directives (PADs). What information should form the basis of the nurse's response?
1. The appointment of a surrogate decision maker is unnecessary.
  2. A client is permitted to dictate what treatments will be given during future hospitalizations.
  3. The need for involuntary admissions is eliminated when a client is a threat to self or others.
  4. A client is allowed to consent or refuse potential psychiatric treatments if a future incapacitating mental health crisis occurs.
33. Which statement **best** describes the practice of psychiatric nursing?
1. Helps people with present or potential mental health problems
  2. Ensures clients' legal and ethical rights by being a client advocate
  3. Focuses interpersonal skills on people with physical or emotional problems
  4. Acts in a therapeutic way with people who are diagnosed as having a mental disorder
34. A physician is admitted to the psychiatric unit of a community hospital. The client, who was restless, loud, aggressive, and resistive during the admission procedure, states, "I will take my own blood pressure." What is the nurse's **most** therapeutic response?
1. "Right now you are just another client."
  2. "If you would rather, I'm sure you will do it correctly."
  3. "I will get the attendants to assist me if you do not cooperate."
  4. "I am sorry, but I cannot allow that because I must take your blood pressure."
35. What is the **most** difficult initial task when developing a nurse-client relationship?
1. Remaining therapeutic and professional
  2. Being able to understand and accept a client's behavior
  3. Developing an awareness of self and the professional role in the relationship
  4. Accepting responsibility for identifying and evaluating the real needs of a client
36. A parent of a 13-year-old adolescent who was recently diagnosed with Hodgkin disease tells a nurse, "I don't want my child to know the diagnosis." How should the

nurse respond?

1. "It is best if your child knows the diagnosis."
2. "Did you know the cure rate for Hodgkin disease is high?"
3. "Would you like someone with Hodgkin disease to talk with you?"
4. "Let's talk about your feeling regarding your child's diagnosis."

37. A male nurse is caring for a client. The client states, "You know, I've never had a male nurse before." What is the nurse's **best** reply?

1. "Does it bother you to have a male nurse?"
2. "How do you feel about having a male nurse?"
3. "There aren't many male nurses. We are a minority."
4. "You sound upset. I will get a female nurse to care for you."

38. A nurse reminds a client that it is time for group therapy. The client responds by yelling at the nurse, "You are always telling me what to do, just like my father!" What defense mechanism is the client using?

1. Regression
2. Transference
3. Reaction formation
4. Cognitive distortion

39. What is the **most** important tool a nurse brings to the therapeutic nurse-client relationship?

1. Oneself and a desire to help
2. Knowledge of psychopathology
3. Advanced communication skills
4. Years of experience in psychiatric nursing

40. A Latino client with schizophrenia is admitted to a mental health unit in an aggravated and disheveled state after failing to take prescribed medications for the last 5 days. When developing a plan of care that incorporates the client's cultural background, the nurse gives **priority** to:

1. socioeconomic considerations regarding hospitalization.
2. the meaning and attention the client places on the future.
3. the client's need to control care to ensure desired outcomes.
4. inclusion of the family in the plan of care with the client's permission.

41. A family member brings a relative to the local community hospital because the relative "has been acting strange." Which statements meet involuntary hospitalization criteria? **Select all that apply.**

1. "I cry all the time, I am so sad."
2. "Since I retired I have been so depressed."
3. "I would like to end it all with sleeping pills."
4. "Voices say it is okay for me to kill all prostitutes."
5. "My boss makes me so angry by always picking on me."

42. A nurse encourages a client to join a self-help group after being discharged from a mental health facility. What is the purpose of having people work in a group?

1. Support

2. Confrontation
3. Psychotherapy
4. Self-awareness

43. As depression begins to lift, a client is asked to join a small discussion group that meets every evening on the unit. The client is reluctant to join because "I have nothing to talk about." What is the **best** response by the nurse?

1. "Maybe tomorrow you will feel more like talking."
2. "Could you start off by talking about your family?"
3. "A person like you has a great deal to offer the group."
4. "You feel you will not be accepted unless you have something to say?"

44. During a group meeting a client tells everyone, "I am afraid of my impending discharge from the hospital." What is the **most** appropriate response by the nurse facilitator?

1. "You ought to be happy that you're leaving."
2. "Maybe you're not ready to be discharged yet."
3. "Maybe others in the group have similar feelings that they would share."
4. "How many in the group feel that this member is ready to be discharged?"

45. At a group therapy session a client tearfully tells the other members, "I just lost my job this week." What is the nurse leader's **most** appropriate response?

1. Ask the client to consider the reasons this may have occurred.
2. Quietly observe how the group responds to the client's statement.
3. Gently suggest that the client check the help-wanted advertisements in the local paper.
4. Request that the group help the client reflect on how the dismissal may have been prevented.

46. A 44-year-old client is unable to function since her husband asked for a divorce 2 weeks ago. She is brought to the crisis intervention center by a friend. What type of crisis reflects this situation?

1. Social
2. Situational
3. Maturational
4. Developmental

47. A client with the diagnosis of paranoid schizophrenia throws a chair across the room and starts screaming at the other clients. Several of these clients have frightened expressions, one starts to cry, and another begins to pace. A nurse removes the agitated client from the room. What should the nurse remaining in the room do next?

1. Continue the unit's activities as if nothing happened.
2. Arrange a unit meeting to discuss what just happened.
3. Refocus clients' negative comments to more positive topics.
4. Have a private talk with the clients who cried or started to pace.

48. A client with a history of violence is becoming increasingly agitated. Which nursing intervention will **most** likely increase the risk of acting out behavior?

1. Being assertive
2. Responding early

3. Providing choices
4. Teaching relaxation
49. A client is diagnosed with a borderline personality disorder. What is a realistic **initial** intervention for this client?
  1. Establish clear boundaries.
  2. Explore job possibilities with the nurse.
  3. Initiate discussion of feelings of being victimized.
  4. Spend one hour twice a day discussing problems with the nurse.
50. A nurse is aware that a co-worker's mother died 16 months ago. The co-worker cries every time someone says the word "mother" or if the mother's name is mentioned. What does the nurse conclude about this behavior?
  1. It is an expected response.
  2. Most people cry when their mother dies.
  3. The co-worker may need help with grieving.
  4. The co-worker was extremely attached to the mother.
51. A nurse educator is leading a class on supporting middle-aged adults who are experiencing midlife crisis. What should the nurse include as the **most** significant factor in the development of this type of crisis?
  1. The perception of their life situation
  2. Many role changes that alter their experiences at this time
  3. The anticipation of negative changes associated with old age
  4. Lack of support from family members who are busy with their own lives
52. What is the **priority** goal when planning care for a client in crisis?
  1. Referring the client for occupational therapy
  2. Restoring the client's psychologic equilibrium
  3. Scheduling the client for follow-up counseling
  4. Having the client gain insight into the problem
- 53. An adult who has been in a gay relationship for 3 years arrives at the emergency department in a near panic state. The client states, "My partner just left me. I am a wreck." What should the nurse do to help the client cope with this loss? **Select all that apply.**
  1. Identify the client's support systems.
  2. Explore the client's psychotic thoughts.
  3. Reinforce the client's current self-image.
  4. Encourage the client to talk about the situation.
  5. Suggest that the client explore personal sexual attitudes.
- 54. Which approaches should a nurse use during crisis intervention? **Select all that apply.**
  1. Active
  2. Passive
  3. Reflective
  4. Interpretative
  5. Goal-directed

55. Which is the **most** important assessment data for a nurse to gather from the client in crisis?

1. The client's work habits
2. Any significant physical health data
3. A history of emotional problems in the family
4. The client's perception of the circumstances surrounding the crisis

56. An extremely anxious client enters a crisis center and asks a nurse for help. Which response **best** reflects the nurse's role in crisis intervention?

1. "Tell me what you have done to help yourself."
2. "I will be here for you to help you figure things out."
3. "I understand that in the past you have had problems."
4. "Tell me about the things that are bothering you the most."

57. When assisting clients to cope with a crisis, the health care provider should follow the principles of intervention. Place the following interventions in order of their priority.

1. \_\_\_\_\_ Stabilize the client.
2. \_\_\_\_\_ Intervene immediately.
3. \_\_\_\_\_ Encourage self-reliance.
4. \_\_\_\_\_ Use the available resources.
5. \_\_\_\_\_ Facilitate understanding of the event.

58. A child in the first grade is murdered, and counseling is planned for the other children in the school. What should a nurse identify **first** before assessing a child's response to a crisis?

1. Developmental level of the child
2. Quality of the child's peer relationships
3. Child's perception of the crisis situation
4. Child's communication patterns with family members

59. What is an initial client objective in relation to anger management?

1. Expressing remorse over aggressive actions
2. Taking responsibility for the hostile behavior
3. Developing alternative methods to release feelings
4. Teaching others how to avoid triggering the angry behavior

60. A nurse leads an assertiveness training program for a group of clients. Which client statement demonstrates that the treatment has been effective?

1. "I know I should put the needs of others before mine."
2. "I won't stand for it, so I told my boss he's a jerk and to get off my back."
3. "It annoys me when people call me 'Dearie,' so I told him not to do it anymore."
4. "It is easier for me to agree up front and then just do enough so that no one notices."

61. A nurse is working with a married woman who has come to the emergency department several times with injuries that appear to be related to domestic violence. While talking with the nurse manager, a nurse expresses disgust that the woman returns to the same situation. What is the nurse manager's **best** response?

1. "She must not have the financial resources to leave her husband."
2. "Most women attempt to leave about six times before they are able to do so."

3. "There is nothing the staff can do because people are free to choose their own life."
4. "These women should be told how foolish they are to remain in their current situation."
62. What is the **most** important information a nurse should teach to prevent relapse in a client with a psychiatric illness?
  1. Develop close support systems
  2. Create a stress-free environment
  3. Refrain from activities that cause anxiety
  4. Follow the prescribed medication regimen
63. A depressed client has been prescribed a tricyclic antidepressant. How long should the nurse inform the client it will take before noticing a significant change in the depression?
  1. 4 to 6 days
  2. 2 to 4 weeks
  3. 5 to 6 weeks
  4. 12 to 16 hours
64. A nurse is teaching clients about dietary restrictions when taking a monoamine oxidase inhibitor (MAOI). What response does the nurse tell them to anticipate if they do not follow these restrictions?
  1. Occipital headaches
  2. Generalized urticaria
  3. Severe muscle spasms
  4. Sudden drop in blood pressure
65. A client is receiving lithium. What is an important nursing intervention while this medication is being administered?
  1. Restrict the client's daily sodium intake.
  2. Test the client's urine specific gravity weekly.
  3. Monitor the client's drug blood level regularly.
  4. Withhold the client's other medications for several days.
66. A client in the hyperactive phase of a mood disorder, bipolar type, is receiving lithium. A nurse identifies that the client's lithium blood level is 1.8 mEq/L. What is the **most** appropriate nursing action?
  1. Continue the usual dose of lithium and note any adverse reactions.
  2. Discontinue the drug until the lithium serum level drops to 0.5 mEq/L.
  3. Ask the health care provider to increase the dose of lithium because the blood lithium level is too low.
  4. Hold the drug and notify the health care provider immediately because the blood lithium level may be toxic.
67. A nurse administers an antipsychotic to a client. For which **common** manageable side effect should the nurse assess the client?
  1. Jaundice
  2. Melanocytosis
  3. Drooping eyelids

4. Unintentional tremors

68. What medication should the nurse expect to administer to actively reverse the overdose sedative effects of benzodiazepines?

1. Lithium
2. Flumazenil
3. Methadone
4. ChlorproMAZINE

69. A nurse is caring for a client who abruptly withdrew from barbiturate use. What should the nurse anticipate that the client may experience?

1. Ataxia
2. Seizures
3. Diarrhea
4. Urticaria

70. Chlordiazepoxide (Librium) 100 mg PO per hour is prescribed for a client with a Clinical Institute Withdrawal Assessment (CIWA) score of 25. The client had 300 mg in 3 hours and is still displaying acute alcohol withdrawal symptoms. What is the next nursing action?

1. Inform the client that the limit of chlordiazepoxide has been reached.
2. Administer chlordiazepoxide as indicated by the client's CIWA score.
3. Request a prescription for another medication to replace the chlordiazepoxide.
4. Inform the health care provider that the maximum dose of chlordiazepoxide has been reached.

71. A client with schizophrenia who has type II (negative) symptoms is prescribed risperidone (Risperdal). Which outcomes indicate that the medication has minimized these symptoms? **Select all that apply.**

1. There is less agitation.
2. There are fewer delusions.
3. There is more interest shown in unit activities.
4. The client reports that the hallucinations have stopped.
5. The client performs activities of daily living independently.

72. A client with a diagnosis of schizophrenia is discharged from the hospital. At home the client forgets to take the medication, is unable to function, and must be rehospitalized. What medication may be prescribed that can be administered on an outpatient basis every 2 to 3 weeks?

1. Lithium
2. Diazepam
3. Fluvoxamine
4. Fluphenazine

73. A client is scheduled for a 6-week electroconvulsive therapy (ECT) treatment program. What intervention is important during the 6-week course of treatment?

1. Provision of tyramine-free meals
2. Avoidance of exposure to the sun
3. Maintenance of a steady sodium intake

4. Elimination of benzodiazepines for nighttime sedation

74. Imipramine (Tofranil), 75 mg three times per day, is prescribed for a client. What nursing action is appropriate when administering this medication?

1. Tell the client that barbiturates and steroids will not be prescribed.
2. Warn the client not to eat cheese, fermenting products, and chicken liver.
3. Monitor the client for increased tolerance and report if the dosage is no longer effective.
4. Have the client checked for increased intraocular pressure and teach about symptoms of glaucoma.

75. A health care provider prescribes haloperidol (Haldol) for a client. What should the nurse teach the client to avoid while taking this medication?

1. Driving at night
2. Staying in the sun
3. Ingesting aged cheeses
4. Taking medications containing aspirin

76. A nurse is evaluating the medication regimens of a group of clients to determine whether the therapeutic level has been achieved. For which medication should the nurse review the client's serum blood level?

1. Sertraline (Zoloft)
2. Lorazepam (Ativan)
3. Olanzapine (Zyprexa)
4. Valproic acid (Depakene)

77. A client with depression is to receive fluoxetine (Prozac). What precaution should the nurse consider when initiating treatment with this drug?

1. It must be given with milk and crackers to avoid hyperacidity and discomfort.
2. Eating cheese or pickled herring or drinking wine may cause a hypertensive crisis.
3. Blood levels may not be sufficient to cause noticeable improvement for 2 to 4 weeks.
4. Blood levels should be obtained weekly for 3 months to monitor for appropriate levels.

78. A client with type 1 diabetes is diagnosed with a psychosis and is to receive haloperidol (Haldol). Which response should a nurse anticipate with this drug combination?

1. Depressed respirations
2. Intensified action of both drugs
3. Decreased control of the diabetes
4. Increased danger of extrapyramidal side effects

79. In conjunction with which classification of medication are trihexyphenidyl, biperiden (Akineton), or benztropine (Cogentin) often prescribed?

1. Anxiolytics
2. Barbiturates
3. Antipsychotics
4. Antidepressants

80. A nurse is educating a client who is taking clozapine (Clozaril) for paranoid schizophrenia. What should the nurse emphasize about the side effects of clozapine?

1. Risk for falls
  2. Inability to sit still
  3. Increase in temperature
  4. Dizziness upon standing
81. A nurse is teaching clients in a medication education group about side effects of medications. Which drug will cause a heightened skin reaction to sunlight?
1. Lithium
  2. Sertraline
  3. Methylphenidate
  4. ChlorproMAZINE
82. A primary nurse observes that a client has become jaundiced after 2 weeks of antipsychotic drug therapy. The primary nurse continues to administer the antipsychotic until the health care provider can be consulted. What does the nurse manager conclude concerning this situation?
1. Jaundice is sufficient reason to discontinue the antipsychotic.
  2. The blood level of antipsychotics must be maintained once established.
  3. Jaundice is a benign side effect of antipsychotics that has little significance.
  4. The prescribed dose for the antipsychotic should have been reduced by the nurse.
83. A client has been receiving fluphenazine for several months. For which side effects should the nurse assess the client? **Select all that apply.**
1. Tremors
  2. Excess salivation
  3. Rambling speech
  4. Reluctance to converse
  5. Minimal use of nonverbal expression
  6. Uncoordinated movement of extremities
84. A client with chronic undifferentiated schizophrenia is receiving an antipsychotic medication. For which potentially irreversible extrapyramidal side effect should a nurse monitor the client?
1. Torticollis
  2. Oculogyric crisis
  3. Tardive dyskinesia
  4. Pseudoparkinsonism
85. A monoamine oxidase inhibitor (MAOI) is prescribed. What should the nurse include in the teaching plan about what to avoid when taking this drug?
1. Ingesting aged cheeses
  2. Prolonged exposure to the sun
  3. Engaging in active physical exercise
  4. Over-the-counter antihistamine drugs
86. A client has been receiving escitalopram (Lexapro) for treatment of a major depressive episode. On the fifth day of therapy the client refuses the medication stating, "It doesn't help, so what's the use of taking it?" What is the nurse's **best** response?
1. "Sometimes it takes 1 to 4 weeks to see an improvement."

2. "It takes 6 to 8 weeks for this medication to have an effect."
  3. "I'll talk to your health care provider about increasing the dose. That may help."
  4. "You should have felt a response by now. I'll notify your health care provider immediately."
87. A client is receiving doxepin (Silenor). For which **most** dangerous side effect of tricyclic antidepressants should a nurse monitor the client?
1. Mydriasis
  2. Dry mouth
  3. Constipation
  4. Urinary retention
88. A client with schizophrenia is actively psychotic, and a new medication regimen is prescribed. A student nurse asks the primary nurse, "Which of the prescribed medications will be **most** helpful for reducing psychotic signs and symptoms?" What should the nurse respond?
1. Citalopram (Celexa)
  2. Ziprasidone (Geodon)
  3. Benztropine (Cogentin)
  4. Acetaminophen with hydrocodone (Lortab)
89. A client with a psychosis is receiving olanzapine (Zydis). What is important for a nurse to consider when administering this drug?
1. It can be given intramuscularly.
  2. A special tyramine-free diet is required.
  3. It dissolves instantly after oral administration.
  4. An empty stomach increases its effectiveness.
90. Antipsychotic drugs can cause extrapyramidal side effects. Which responses should the nurse document as indicating pseudoparkinsonism? **Select all that apply.**
1. Rigidity
  2. Tremors
  3. Mydriasis
  4. Photophobia
  5. Bradykinesia
91. A client with schizophrenia is taking benztropine (Cogentin) in conjunction with an antipsychotic. The client tells a nurse, "Sometimes I forget to take the Cogentin." What should the nurse teach the client to do if this happens again?
1. Use 2 pills at the next regularly scheduled dose.
  2. Notify the health care provider about the missed dose immediately.
  3. Take a dose as soon as possible, up to 2 hours before the next dose.
  4. Skip the dose, and then take the next regularly scheduled dose 2 hours early.
92. Olanzapine (Zyprexa) is prescribed for a client with bipolar disorder, manic episode. What cautionary advice should the nurse give the client?
1. Sit up slowly.
  2. Report double vision.
  3. Expect increased salivation.

4. Take the medication on an empty stomach.

►93. Neuroleptic malignant syndrome is a potentially fatal reaction to antipsychotic therapy. What signs and symptoms of this syndrome should the nurse identify? **Select all that apply.**

1. Jaundice
2. Diaphoresis
3. Hyperrigidity
4. Hyperthermia
5. Photosensitivity

►94. Olanzapine (Zyprexa) is prescribed for a client who experienced agranulocytosis from Clozapine (Clozaril). Which statements indicate that the nurse's teaching about olanzapine has been effective? **Select all that apply.**

1. "I need to be careful that I do not gain too much weight."
2. "I should be careful so I don't nick myself when I shave."
3. "This medication should help me enjoy pleasurable activities."
4. "I will have to remember to take my benztropine (Cogentin)."
5. "Restlessness can occur when I am taking this medication."

►95. A client is admitted to the acute medical unit for severe amphetamine intoxication. Which medications should a nurse anticipate will be prescribed to counteract the effects of stimulant intoxication? **Select all that apply.**

1. Diazepam
2. Propranolol
3. Benztropine
4. BuPROPion
5. Amitriptyline

96. A client with mild Alzheimer disease has been taking galantamine (Razadyne), and the health care provider prescribes paroxetine (Paxil) for depression. For what effect should a nurse assess the client when these medications are taken concurrently?

1. Allergic
2. Dystonic
3. Additive
4. Extrapramidal

# Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence

97. A nurse is caring for a preschool-age child with a history of physical and sexual abuse. What is the **most** advantageous therapy for this child?

1. Play
2. Group
3. Family
4. Psychodrama

98. A 3-year-old child is diagnosed with autism. Which behaviors should the nurse expect when assessing this child? **Select all that apply.**

1. Imitates others.
2. Seeks physical contact.
3. Avoids eye-to-eye contact.
4. Engages in cooperative play.
5. Performs repetitive activities.
6. Displays interest in children rather than adults.

99. A nurse uses behavior modification to foster toilet training efforts in a cognitively impaired child. What reward should the nurse provide to reinforce appropriate use of the toilet?

1. Candy bar
2. Piece of fruit
3. Hug with praise
4. Choice of rewards

100. A nurse is planning care for a group of hospitalized children. Which age group does the nurse anticipate will have the **most** problem with separation anxiety?

1. 12 to 18 years
2. 5 to  $11\frac{1}{2}$  years
3. 6 to 30 months
4. 36 to 59 months

101. A nurse considers that autism is a form of a pervasive developmental disorder (PDD). Which factor unique to autism differentiates it from other forms of PDD?

1. Has less severe linguistic handicaps
2. Has an early onset before 36 months of age
3. Is the only form that does not include seizures
4. Is the only form that does not include mental retardation

102. What is the prognosis for a normal productive life for a child diagnosed with autism?

1. Dependent on an early diagnosis
2. Often related to the child's overall temperament
3. Ensured as long as the child attends a school tailored to meet needs
4. Unlikely because of interference with so many parameters of functioning

103. For what **most** common characteristic of autism should a nurse assess a child suspected of having this disorder?
1. Responds to any stimulus.
  2. Responds to physical contact.
  3. Seems unresponsive to the environment.
  4. Interacts with children rather than adults.
104. A nurse is assessing a child suspected of having autism. At what age does the nurse determine that the signs of autism **initially** may be evident?
1. 2 years of age
  2. 6 years of age
  3. 6 months of age
  4. 1 to 3 months of age
105. For which clinical indication should a nurse observe a child suspected of being autistic?
1. Lack of eye contact
  2. Crying for attention
  3. Catatonic-like rigidity
  4. Engaging in parallel play
106. A 6-year-old child with autism is nonverbal and has limited eye contact. What should a nurse do **initially** to promote social interaction?
1. Encourage the child to sing songs with the nurse.
  2. Engage in parallel play while sitting next to the child.
  3. Provide opportunities for the child to play with other children.
  4. Use therapeutic holding when the child does not respond to verbal interactions.
107. A 10-year-old child who was diagnosed with autism at the age of 3 attends a school for developmentally disabled children and lives with the parents. The child has frequent episodes of self-biting behavior, banging the head, and needing help with feeding and toileting. The **priority** nursing goal for this child is "The child will:
1. control repetitive behaviors."
  2. be able to feed independently."
  3. remain safe from self-inflicted injury."
  4. develop control of urinary elimination."
108. When planning activities for a child with autism, the nurse considers that autistic children respond **best** to:
1. loud, cheerful music.
  2. large-group activities.
  3. individuals in small groups.
  4. their own self-stimulating acts.
109. A nurse is interviewing a child with attention deficit disorder. For which major characteristic should the nurse assess this child?
1. Overreaction to stimuli
  2. Continued use of rituals
  3. Delayed speech development

4. Inability to use abstract thought

110. A nurse is teaching parents of a child with attention deficit hyperactivity disorder (ADHD). What should the nurse include as the **most** frequently prescribed medication for this disorder?

1. Lorazepam (Ativan)
2. Haloperidol (Haldol)
3. Methylphenidate (Ritalin)
4. Methocarbamol (Robaxin)

111. A hyperactive 9-year-old child with a history of attention deficit hyperactivity disorder (ADHD) is admitted for observation after a motor vehicle collision. What should be the focus of nursing actions when teaching about personal safety?

1. Requesting that the child write at least three safety rules
2. Asking the child to verbalize as many safety rules as possible
3. Talking with the child about the importance of using a seat belt
4. Encouraging the child to talk with other children about their opinions of safety rules

112. A 4-year-old child is diagnosed with attention deficit hyperactivity disorder (ADHD). What information about the child's behavior should the nurse expect when obtaining a health history from the parents? **Select all that apply.**

1. Is impulsive
2. Talks excessively
3. Is spiteful and vindictive
4. Annoys others deliberately
5. Plays video games for hours
6. Does not follow through or finish tasks

113. A nurse is counseling the family of a child with school phobia. What should the parents be taught to do?

1. Accompany the child to the classroom
2. Return the child to school immediately
3. Instruct the child as to why school attendance is necessary
4. Allow the child to enter the classroom before other children

114. What childhood problem has legal as well as emotional aspects and cannot be ignored?

1. School phobias
2. Fear of animals
3. Fear of monsters
4. Sleep disturbances

115. The parent of a child with a tentative diagnosis of attention deficit hyperactivity disorder (ADHD) arrives at the pediatric clinic insisting on receiving a prescription for medication that will control the child's behavior. What is the nurse's **best** response?

1. "It must be frustrating to deal with your child's behavior."
2. "Have you considered any alternatives to using medication?"
3. "Perhaps you are looking for an easy solution to the problem."
4. "Let me teach you about the side effects of medications used for ADHD."

116. A nurse anticipates that children with attention deficit hyperactivity disorder (ADHD) may be learning-disabled. This means that these children:

1. will probably not be self-directed learners.
2. have intellectual deficits that interfere with learning.
3. experience perceptual difficulties that interfere with learning.
4. are performing usually two grade levels below their age norm.

117. A nurse is teaching the parents of a child with attention deficit hyperactivity disorder (ADHD) about the prescribed medication methylphenidate (Ritalin). What time should the daily dose be administered?

1. Before breakfast
2. Just after breakfast
3. Immediately before lunch
4. As soon as the child awakens

118. A child is diagnosed with attention deficit hyperactivity disorder (ADHD). What is a strategy that the nurse should teach the parents to assist in coping with this disorder?

1. Orient the child to reality.
2. Reward appropriate conduct.
3. Suppress feelings of frustration.
4. Use restraints when behavior is out of control.

119. An 8-year-old child is diagnosed with oppositional defiant disorder. What behavior should the nurse identify that supports this diagnosis?

1. Is easily distracted
2. Argues with adults
3. Lies to obtain favors
4. Initiates physical fights

120. An adolescent with the diagnosis of conduct disorder since the age of 9 is placed in a residential facility. The adolescent has a history of fighting, stealing, vandalizing property, and running away from home. The adolescent is aggressive, has no friends, and has been suspended from school repeatedly. What is the nurse's **priority** when developing a plan of care?

1. Preventing violence
2. Encouraging insight
3. Supporting self-esteem
4. Promoting social interaction

121. A nurse works with school-age children who have a conduct disorder, childhood-onset type. The nurse considers that these children are at risk for progressing to an additional disorder during adolescence. For signs of which disorder should the nurse assess their present behavior?

1. Oppositional defiant
2. Antisocial personality
3. Pervasive developmental
4. Attention deficit hyperactivity

122. A child with attention deficit hyperactivity disorder (ADHD) often becomes

frustrated and loses control. A nurse uses a variety of graduated techniques to manage disruptive behaviors. List the following interventions in order from the **least** invasive to the **most** invasive technique.

1. \_\_\_\_\_ Placing the child in a time-out
  2. \_\_\_\_\_ Monitoring behavior for cues of rising anxiety
  3. \_\_\_\_\_ Using a signal to remind the child to use self-control
  4. \_\_\_\_\_ Avoiding situations that usually precipitate frustration
  5. \_\_\_\_\_ Refocusing the child's behavior with a specific directive
123. An adolescent with a conduct disorder is receiving behavioral therapy to attempt to limit activities that violate societal norms. A specific outcome criterion unique for adolescents with this problem is "The client will:
1. exhibit increased impulse control."
  2. identify two positive personal attributes."
  3. demonstrate respect for the rights of others."
  4. use age-appropriate play activities with at least one peer."

# Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

124. A nurse is conducting a mini-mental status examination on an older client. What should the nurse ask the client to do when testing short-term memory?

1. Subtract serial 7s from 100.
2. Copy one simple geometric figure.
3. State three random words mentioned earlier in the exam.
4. Name two common objects when the nurse points to them.

125. A nurse is teaching a client and family about the characteristics of dementia of the Alzheimer type. What characteristic should the nurse include?

1. Periodic exacerbations
2. Aggressive acting-out behavior
3. Hypoxia of selected areas of brain tissue
4. Areas of brain destruction called senile plaques

126. A client with dementia has been cared for by the spouse for 5 years. During the last month the client has become agitated and aggressive and is incontinent of urine and feces. What is the **priority** nursing care while this client is in an inpatient mental health facility?

1. Managing the behavior
2. Preventing further deterioration
3. Focusing on the needs of the spouse
4. Establishing an elimination retraining program

127. Which nursing intervention is **most** helpful in meeting the needs of an older adult with the diagnosis of dementia of the Alzheimer type?

1. Providing nutritious foods high in carbohydrates and proteins
2. Offering opportunities for choices in the daily schedule to stimulate interest
3. Developing a consistent plan with fixed time schedules to provide for emotional needs
4. Simplifying the environment as much as possible and eliminating the need for decisions and choices

128. When attempting to assess the behavior of an older adult diagnosed with vascular dementia, a nurse considers that the client probably is:

1. not capable of using any defense mechanisms.
2. using one method of defense for every situation.
3. making exaggerated use of old, familiar mechanisms.
4. attempting to develop new defense mechanisms to meet the current situation.

129. What should a nurse include in the plan of care for a client with vascular dementia?

1. A reeducation program
2. Details for supportive care
3. An introduction of new leisure-time activities
4. Plans for involvement in group therapy sessions

▶130. A nurse is assessing a client and attempting to distinguish between dementia and

delirium. Which factors are unique to delirium? **Select all that apply.**

1. Slurred speech
2. Lability of mood
3. Long-term memory loss
4. Visual or tactile hallucinations
5. Insidious deterioration in cognition
6. Fluctuating levels of consciousness

131. A delirious client sees a design on the wallpaper and perceives it as an animal. How should a nurse communicate what the client perceived at the change of shift report?

1. A delusion
2. An illusion
3. A hallucination
4. An idea of reference

132. A nurse's **best** approach when caring for a confused, older client is to provide an environment with:

1. space for privacy.
2. group involvement.
3. trusting relationships.
4. activities that are varied.

133. An older adult on the mental health unit begins acting out while in the day room. What is a nurse's initial intervention?

1. Instruct the client to be quiet.
2. Allow the client to act out until fatigue sets in.
3. Give the client directions in a firm, low-pitched voice.
4. Guide the client from the room by gently holding the client's arm.

134.▶ A nurse is assessing an older adult with the diagnosis of dementia. Which manifestations are expected in this client? **Select all that apply.**

1. Resistance to change
2. Inability to recognize familiar objects
3. Preoccupation with personal appearance
4. Inability to concentrate on new activities or interests
5. Tendency to dwell on the past and ignore the present

135. When answering questions from the family of a client with Alzheimer disease, the nurse explains, "This disease is:

1. one that emerges in the fourth decade of life."
2. a slow and relentless deterioration of the mind."
3. functional in origin that occurs in the later years."
4. diagnosed through laboratory and psychologic tests."

▶136. A client in the early dementia stage of Alzheimer's disease is admitted to a long-term care facility. Which activities must the nurse initiate? **Select all that apply.**

1. Weigh the client once a week.
2. Have specialized rehabilitation equipment available.
3. Keep the client in pajamas and robe most of the day.

4. Establish a schedule with periods of rest after activities.
  5. Review the client's weekly budget and use of community resources.
  6. Set up a plan for weekly entertainment through a senior citizens group.
137. Nurses working with clients who have a diagnosis of dementia should adopt a common approach of care because these clients need to:
1. relate in a consistent manner to staff.
  2. learn that the staff cannot be manipulated.
  3. accept controls that are concrete and fairly applied.
  4. have sameness and consistency in their environment.
- 138.▶ A nurse is assessing a client with dementia. Which clinical manifestations are expected? **Select all that apply.**
1. Agitation
  2. Pessimism
  3. Short attention span
  4. Disordered reasoning
  5. Impaired motor activities
139. What is the **priority** nursing objective of the therapeutic psychiatric environment for a confused client?
1. Assist the client to relate to others.
  2. Make the hospital atmosphere more home-like.
  3. Help the client become accepted in a controlled setting.
  4. Maintain the highest level of safe, independent functioning.
140. What is the **most** appropriate nursing intervention for clients who exhibit mild cognitive impairment?
1. Reality orientation
  2. Behavioral confrontation
  3. Reflective communication
  4. Reminiscence group therapy
141. What are the four "As" for which nurses should assess clients suspected of having Alzheimer disease?
1. Amnesia, apraxia, agnosia, aphasia
  2. Avoidance, aloofness, asocial, asexual
  3. Autism, loose association, apathy, affect
  4. Aggressive, amoral, ambivalent, attractive
142. An older adult is brought to the clinic by a family member because of increasing confusion over the past week. What can the nurse ask clients to assess their orientation to place?
1. Explain a proverb.
  2. State where they were born.
  3. Identify the name of the town.
  4. Recall what they had eaten for breakfast.
143. A nurse is assigned to care for a regressed college student who has been talking to unseen people and refusing to get out of bed, go to class, or get involved in daily

grooming activities. What is the nurse's initial effort toward helping this client?

1. Providing frequent rest periods
2. Reducing environmental stimuli
3. Facilitating the client's social relationships with a peer group
4. Attempting to establish a meaningful relationship with the client

144. A client diagnosed with schizophrenia is experiencing auditory hallucinations. A nurse makes the following statements when interacting with this client. Place these statements in the order in which they should occur.

1. \_\_\_\_\_ "I do not hear any voices."
2. \_\_\_\_\_ "Come with me for a walk."
3. \_\_\_\_\_ "Hearing voices must be frightening."
4. \_\_\_\_\_ "The voices you hear are part of your illness."
5. \_\_\_\_\_ "Let's play cards with another client in the recreation room."

145. A client with schizophrenia has a history of hearing voices that say, "You are a bad person." While having a conversation with a nurse with whom the client has been working, the client states, "I am starting to hear the same voices again." What is the nurse's **best** response?

1. "Try to ignore the voices."
2. "What are the voices saying to you?"
3. "Do you believe what the voices are saying?"
4. "Try not to be afraid because they are only voices."

146. What should a nurse do when caring for a client whose behavior is characterized by pathologic suspicion?

1. Protect the client from environmental stress.
2. Help the client realize the suspicions are unrealistic.
3. Ask the client to explain the reasons for the feelings.
4. Help the client to feel accepted by the staff on the unit.

147. One evening a nurse finds a client who has been experiencing persecutory delusions trying to get out the door. The client states, "Please let me go. I trust you. The Mafia is going to kill me tonight." Which response is **most** therapeutic?

1. "You are frightened. Come with me to your room, and we can talk about it."
2. "Come with me to your room. I'll lock the door, and no one will get in to harm you."
3. "Nobody here wants to harm you, and you know that. I'll come with you to your room."
4. "Thank you for trusting me. Maybe you can trust me when I tell you no one will kill you here."

148. A delusional client refuses to eat because of a belief that the food is poisoned. What is the **most** appropriate initial nursing intervention?

1. State that the food is not poisoned.
2. Taste the food in the client's presence.
3. Show the client that other people are eating without being harmed.
4. Tell the client that tube feedings will be started if eating does not begin.

149. A client with schizophrenia is admitted to an acute care psychiatric unit. Which

clinical findings indicate positive signs and symptoms associated with schizophrenia?

1. Withdrawal, poverty of speech, inattentiveness
2. Flat affect, decreased spontaneity, asocial behavior
3. Hypomania, labile mood swings, episodes of euphoria
4. Hyperactivity, auditory hallucinations, loose associations

150. An acutely ill client with the diagnosis of schizophrenia has just been admitted to the mental health unit. What is the **most** therapeutic initial nursing intervention?

1. Spend time with the client to build trust and demonstrate acceptance.
2. Involve the client in occupational therapy and use diversional activity.
3. Delay one-to-one client interactions until medications reduce the psychotic symptoms.
4. Involve the client in multiple small-group discussions to distract attention from the fantasy world.

151. A client with schizophrenia plans an activity schedule with the help of the treatment team. A written copy is posted in the client's room. What should the nurse say when it is time for the client to go for a walk?

1. "It's time for you to go for a walk now."
2. "Do you want to take your scheduled walk now?"
3. "When would you like to go for your walk today?"
4. "You are supposed to be going for your walk now."

152. During the admission procedure, a client appears to be responding to voices. The client cries out at intervals, "No, no, I didn't kill him. You know the truth; tell that police officer. Please help me!" What is the nurse's **most** appropriate response?

1. Sit quietly and not respond to the client's statements.
2. Listen attentively and assume a facial expression of disbelief.
3. Respond by saying, "I want to help you. I realize you must be very frightened."
4. Say, "Do not become so upset. No one is talking to you; those voices are part of your illness."

153. A client is delusional, talking about people who are plotting to do harm. A nurse identifies that the client is pacing more than usual and is concerned that the client is beginning to lose control. What is the **best** nursing intervention?

1. Advise the client to use a punching bag.
2. Move the client to a quiet place on the unit.
3. Encourage the client to sit down for a while.
4. Allow the client to continue pacing with supervision.

154. A client with a history of schizophrenia attends the mental health clinic for a regularly scheduled group therapy session. The client arrives agitated and exhibits behaviors that indicates the hearing of voices. When a nurse begins to walk toward the client, the client pulls out a large knife. Which is the nurse's **best** approach?

1. Firm
2. Passive
3. Empathetic
4. Confrontational

155. While a nurse is talking with a client, another client comes up and yells, "I hate you!"

You're talking about me again," and throws a glass of juice at the nurse. What is the nurse's **best** response to this outburst?

1. Repeat the client's words and ask for clarification.
2. Remove the client from the room because limits must be placed on the behavior.
3. Ignore both the behavior and the client, clean up the juice, and talk with the client later.
4. Verbalize feelings of annoyance as an example to the client that it is more acceptable to verbalize feelings than to act them out.

156. As a nurse enters a room and approaches a client who has schizophrenia, the client states, "Get out of here before I hit you! Go away!" The nurse concludes that this aggressive behavior is probably related to the fact that the client felt:

1. that voices were directing the behavior.
2. trapped when the nurse walked into the room.
3. afraid of doing harm to the nurse if the nurse came closer.
4. that nurse was similar to someone who was previously frightening.

157. A client who experiences auditory hallucinations agrees to discuss alternative coping strategies with a nurse. For the next 3 days when the nurse attempts to focus on alternative strategies, the client gets up and leaves the interaction. What is the nurse's **most** therapeutic response?

1. "Come back; you agreed that you would discuss other ways to cope."
2. "You seem very uncomfortable every time I bring up a new way to cope."
3. "Did you agree to talk about other ways to cope because you thought that was what I wanted?"
4. "You walk out each time I start to discuss the hallucinations; does that mean you've changed your mind?"

158. What is a nurse's **most** appropriate action when a client is seen openly masturbating in the recreation room?

1. Restraining the client's hands
2. Putting the client in seclusion
3. Escorting the client out of the room
4. Teaching the client acceptable behavior

159. What should the nurse do to achieve a primary objective of providing a therapeutic daycare environment for a client who is withdrawn and reclusive?

1. Foster a trusting relationship.
2. Administer medications on time.
3. Involve the client in a group with peers.
4. Remove the client from the family home.

160. A client experiencing hallucinations tells a nurse, "The voices are telling me I'm no good." The client asks whether the nurse hears the voices. Which is the nurse's **most** appropriate response?

1. "No, I do not hear the voices, but I believe you can hear them."
2. "It is the voice of your conscience, which only you can control."
3. "Those voices are coming from within you; only you can hear them."

4. "Hearing the voices are a symptom of your illness; don't pay attention to them."
161. A nurse enters a client's room and identifies that the client appears preoccupied. Turning to the nurse, the client states, "They are saying terrible things about me. Can't you hear them?" What is the nurse's **most** therapeutic response?
1. "It seems you heard them before."
  2. "Try to get control of your feelings."
  3. "There is no one here but me, and I don't hear anything."
  4. "I don't hear anyone else talking, but I can see you are upset."
162. A nurse observes a regressed, emotionally disturbed client using the hands to eat soft foods. What is the **best** nursing intervention?
1. Give the client a spoon and suggest it be used.
  2. Say in a joking way, "Well, I guess fingers were made before forks."
  3. Ignore the behavior and observe several additional meals before intervening.
  4. Remove the food while saying, "You can't have any more until you use your spoon."
163. What clinical manifestation is the **most** serious indication of impending assaultive behavior by a client on a mental health unit?
1. Uses profane language
  2. Touches people excessively
  3. Exhibits a sudden withdrawal
  4. Experiences command hallucinations
164. While watching TV in the day room, a client who has demonstrated withdrawn, regressed behavior suddenly screams, bursts into tears, and runs out of the room to the far end of the hallway. What is the **most** therapeutic action by the nurse?
1. Walk to the end of the hallway where the client is standing.
  2. Accept the action as being the impulsive behavior of a sick person.
  3. Ask another client in the day room why the client acted as she did.
  4. Document the incident in the client's record while the memory is fresh.
165. How should a nurse intervene when a regressed, emotionally disturbed client voids on the floor in the sitting room of the mental health unit?
1. Make the client mop the floor.
  2. Restrict the client's fluids for the rest of the day.
  3. Toilet the client more frequently with supervision.
  4. Withhold the client's privileges each time the client voids on the floor.
166. A regressed, emotionally disturbed client who has been watching a nurse for a few days suddenly walks up and shouts, "You think you're so damned perfect and good. I think you stink!" What is the nurse's **most** appropriate response?
1. "Do you mean I smell?"
  2. "You seem angry with me."
  3. "Boy, you're in a bad mood."
  4. "I can't be all that bad, can I?"
167. A client tells the nurse, "I am a terrible, evil person; the voices are telling me that God needs to punish me." What is the nurse's **most** therapeutic initial response?
1. "God is loving and will not punish you."

2. "Those voices you are hearing are a fantasy."
  3. "Tell me what you are thinking about yourself."
  4. "You aren't wicked, since both God and I love you."
168. What is the **most** appropriate way for the nurse to help a withdrawn, emotionally disturbed adolescent client to accept the realities of daily living?
1. Assist the client to care for personal hygiene needs.
  2. Encourage the client to keep up with school studies.
  3. Persuade the client to join the other clients in group activities.
  4. Leave the client alone when there appears to be a disinterest in daily activities.
169. What is the **best** nursing intervention to encourage a withdrawn, noncommunicative client to talk?
1. Focus on nonthreatening subjects.
  2. Try to get the client to discuss feelings.
  3. Ask simple questions that require "yes" or "no" answers.
  4. Sit quietly while looking through magazines with the client.
170. What is an important aspect of nursing care for a client exhibiting psychotic patterns of thinking and behavior?
1. Help keep the client oriented to reality.
  2. Involve the client in activities throughout the day.
  3. Help the client understand that it is harmful to withdraw from situations.
  4. Encourage the client to discuss why interacting with other people is being avoided.
171. Why is observation an especially important aspect of nursing care for a withdrawn client?
1. It assists in confirming the client's diagnosis.
  2. It helps in understanding the client's behavior.
  3. The staff is informed about the client's illness.
  4. The degree of the client's depression is indicated.

# Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood

172. A client's admitting history indicates signs of akathisia. What clinical finding should the nurse expect when assessing for akathisia?

1. Facial tics
2. Motor restlessness
3. Maintaining a body position for hours
4. Repeating the movements of another person

173. A client is diagnosed with generalized anxiety disorder. For what behavior should the nurse assess a client to determine the effectiveness of therapy?

1. Participates in activities
2. Learns how to avoid anxiety
3. Takes medication as prescribed
4. Identifies when anxiety is developing

174. A nurse is caring for a client with a generalized anxiety disorder. Which factor should be assessed to determine the client's present status?

1. Memory
2. Behavior
3. Judgment
4. Responsiveness

175. A client arrives at the mental health clinic disheveled, agitated, and demanding that the nurse "do something to end this feeling." What clinical manifestation is evident?

1. Feelings of panic
2. Suicidal tendencies
3. Narcissistic ideation
4. Demanding personality

176. A client's severe anxiety and panic are often considered to be "contagious." What action should be taken when a nurse's personal feelings of anxiety are increasing?

1. Refocus the conversation on some pleasant topics.
2. Say to the client, "Calm down. You are making me anxious, too."
3. Say, "Another staff member is coming in. I will leave and return later."
4. Remain quiet so that personal feelings of anxiety do not become apparent to the client.

177. In what situation should a nurse anticipate that a client will experience a phobic reaction?

1. Seeking attention from others
2. Thinking about the feared object
3. Coming into contact with the feared object
4. Being exposed to an unfamiliar environment

178. A nurse is interviewing a client with a phobia. Which treatment should the nurse inform the client has the highest success rate?

1. Insight therapy to determine the origin of the fear

2. Systematic desensitization using relaxation techniques
  3. Psychotherapy aimed at rearranging psychotic thought processes
  4. Psychoanalytic exploration of repressed conflicts of an earlier developmental phase
- 179. An adult reports anxiety, palpitations, and a feeling of impending doom. After a thorough physical examination, the health care provider diagnoses a panic attack. Lorazepam (Ativan) 1.5 mg po stat is prescribed. The Ativan is available in 0.5 mg tablets. How many tablets should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ tablets

180. A nurse speaks with a client who just experienced a panic attack. Which statement is **most** therapeutic when addressing the client's concerns?

1. "I would have been upset, too."
2. "You are concerned that this might happen again."
3. "Episodes like this can be upsetting even though they do end."
4. "Your family must have thought you were having a heart attack."

►181. People who are involved in a bioterrorism attack exhibit immediate reactions to the traumatic event. Which responses can a nurse expect in survivors during the immediate period after a traumatic event? **Select all that apply.**

1. Guilt
2. Denial
3. Altruism
4. Confusion
5. Helplessness

182. The parents of an adolescent who is experiencing posttraumatic stress disorder have decided to care for their child at home. What is the **priority** intervention that the home health nurse must include in the plan of care?

1. Encourage the parents to keep their child within the home environment.
2. Help the parents identify their child's problems that cause them to be fearful.
3. Assist the parents to understand that their child may avoid emotional attachments.
4. Discuss with the parents their feelings of ambivalence about what their child is enduring.

183. A client with a general anxiety disorder says to the nurse, "What can I do to prevent overreacting to stress?" What is the nurse's **best** response?

1. "Hone your problem-solving skills."
2. "Improve your time management skills."
3. "Ignore situations that you cannot change."
4. "Develop a wide variety of coping strategies."

184.► What clinical findings may be expected when a nurse assesses an individual with an anxiety disorder? **Select all that apply.**

1. Worrying about a variety of issues
2. Acting out with antisocial behavior
3. Regressing to an earlier level of adjustment
4. Converting the anxiety into a physical symptom

5. Displacing the anxiety onto a less threatening object

185. How should a nurse expect a client's anxiety to be manifested physiologically?

1. Constricted pupils
2. Narrowed bronchioles
3. Decreased blood pressure
4. Increased blood glucose level

186. What is an appropriate way a nurse can help a client to decrease anxiety?

1. Avoid unpleasant events.
2. Prolong exposure to fearful situations.
3. Acquire skills with which to face stressful events.
4. Introduce an element of pleasure into fearful situations.

187. A client comes to a mental health center with severe anxiety evidenced by crying, wringing the hands, and pacing. What should be the **first** nursing intervention?

1. Stay physically close to the client.
2. Gently ask what is bothering the client.
3. Tell the client to try to relax by sitting quietly.
4. Involve the client in a nonthreatening activity.

188. A nurse considers that in a conversion disorder pseudoneurologic symptoms such as paralysis or blindness:

1. are unconscious methods for getting attention.
2. will subside if the client is helped to focus on getting healthy.
3. are generally necessary for the client to cope with a stressful situation.
4. will usually resolve when the client learns to cope with ongoing family conflicts.

189. An anxious client reports experiencing pain in the abdomen and feeling empty and hollow. A diagnostic workup reveals no physical causes of these clinical findings. What term **best** reflects what the client is experiencing?

1. Dissociation
2. Somatization
3. Stress response
4. Anxiety reaction

190. A client newly diagnosed with a conversion disorder is manifesting paralysis of a leg. The nurse can expect this client to:

1. demonstrate a spread of paralysis to other body parts.
2. require continuous psychiatric treatment to maintain independent functioning.
3. recover the use of the affected leg but, under stress, again develop similar symptoms.
4. follow an unpredictable emotional course in the future, depending on exposure to stress.

191. A nurse is caring for a client who has a diagnosis of conversion disorder with paralysis of the lower extremities. Which is the **most** therapeutic nursing intervention?

1. Encouraging the client to try to walk
2. Explaining to the client that there is nothing wrong
3. Avoiding focusing on the client's physical symptoms
4. Helping the client follow through with the physical therapy plan

192. What characteristic of anxiety is associated with a diagnosis of conversion disorder?
1. Free floating
  2. Relieved by the symptom
  3. Consciously felt by the client
  4. Projected onto the environment
193. What characteristic uniquely associated with psychophysiologic disorders differentiates them from somatoform disorders?
1. Emotional cause
  2. Feeling of illness
  3. Restriction of activities
  4. Underlying pathophysiology
194. A client believes that doorknobs are contaminated and refuses to touch them, except with a paper tissue. What nursing intervention is **most** therapeutic for this client?
1. Supply the client with paper tissues to help functioning until anxiety is reduced.
  2. Have the client scrub the doorknobs with a strong antiseptic so that tissues are no longer needed.
  3. Encourage the client to touch doorknobs by removing all available paper tissue until learning how to manage the situation.
  4. Explain to the client that the idea about doorknobs being contaminated is part of the illness, so precautions are not necessary.
195. A nurse is caring for a client diagnosed with an obsessive-compulsive disorder. What is the basis for the obsessions and compulsions?
1. Unconscious control of unacceptable feelings
  2. Conscious use of this method to punish themselves
  3. Acceptance of voices that tell them the doorknobs are unclean
  4. Fulfillment of a need to punish others by carrying out an annoying procedure
196. A nurse is developing a care plan for a client with an obsessive-compulsive behavior disorder. Which nursing intervention will **most** likely increase the client's anxiety?
1. Helping the client understand the nature of the anxiety
  2. Limiting the client's ritualistic acts to three times a day
  3. Involving the client in establishing the therapeutic plan
  4. Providing the client with a nonjudgmental environment
197. Hospitalization or day-treatment centers are often indicated for the treatment of a client with an obsessive-compulsive disorder because these settings:
1. prevent the client from completing rituals.
  2. allow the staff to exert control over the client's activities.
  3. resolve the client's anxiety because decision making is minimal.
  4. provide the neutral environment the client needs to work through conflicts.
198. What should a nurse include in the initial plan of care for a client with the long-standing, obsessive-compulsive behavior of hand washing?
1. Determine the purpose of the ritualistic behavior.
  2. Limit the time allowed for the ritualistic behavior.
  3. Suggest a symptom substitution technique to refocus the ritualistic behavior.

4. Develop a routine schedule of activities to reduce the need for the ritualistic behavior.
199. A client with a history of obsessive-compulsive behaviors has a marked decrease in symptoms and expresses a wish to obtain a part-time job. On the day of a job interview the client arrives at the mental health center displaying signs of anxiety. What is the nurse's **best** response to the client's behavior?
1. "I know you're anxious, but by forcing yourself to go to the interview, you may conquer your fear."
  2. "If going to an interview makes you this anxious, it seems as though you're not ready to go back to work."
  3. "It must be that you really don't want that job after all. I think you should reconsider going to the interview."
  4. "Going for your interview triggered some feelings in you. Perhaps you could call a friend to drive you there."
200. What should a nurse consider when planning care for a client who is using ritualistic behavior?
1. Nurses must attempt to limit the ritualistic behavior.
  2. Clients need to realize that ritualistic behavior serves no purpose.
  3. Nurses should try to divert the ritual immediately after it is started.
  4. Clients do not want to repeat the ritual but feel compelled to do so.
201. What is the **priority** discharge criterion for a client who is using ritualistic behaviors?
1. Verbalizes positive aspects about the self
  2. Follows the rules of the therapeutic milieu
  3. Intervenes to maintain increasing anxiety at a manageable level
  4. Recognizes that hallucinations occur at times of extreme anxiety
202. A nurse is caring for a client who uses ritualistic behavior. What common antiobsessional medication does the nurse anticipate will be prescribed?
1. Benztropine
  2. Amantadine
  3. Fluvoxamine
  4. DiphenhydrAMINE
203. A client is using ritualistic behaviors. Why should a nurse allow the client ample time for the performance of the ritual?
1. Denial of this activity may precipitate panic levels of anxiety.
  2. Anger turned inward on the self should be allowed to be expressed.
  3. Successful performance of independent activities enhances self-esteem.
  4. Ample time provides an opportunity to point out the inappropriate behavior.
204. A nurse is caring for a client with an obsessive-compulsive personality disorder that involves rituals. What should the nurse conclude about the ritual?
1. Has a purpose but is useless
  2. Is performed after long urging
  3. Appears to be performed willingly
  4. Seems illogical but is needed by the person
205. A nurse is preparing to care for a client who engages in ritualistic behavior. What

should the plan of care include?

1. Redirect energy into activities to help others.
2. Teach the client that the behavior is not serving a realistic purpose.
3. Administer antianxiety medications that block out the memory of internal fears.
4. Help the client to understand that the behavior is caused by maladaptive coping to increased anxiety.

206. Which is the **best** nursing intervention during the working phase of the therapeutic relationship to meet the needs of individuals who demonstrate obsessive-compulsive behavior?

1. Restricting their movements
2. Calling attention to the behavior
3. Keeping them busy to distract them
4. Supporting rituals while setting realistic limits

207. A nurse is caring for a client with a somatoform disorder. What should the nurse anticipate that this client will do?

1. Redirect the conversation with the nurse to physical symptoms.
2. Monopolize conversations about the anxiety being experienced.
3. Write down conversations to assist in remembering information.
4. Start a conversation asking the nurse to recommend palliative care.

208. A client who is being admitted to the mental health unit with bipolar disorder is depressed, avoids eye contact, responds in a very low voice, and is tearful. What is **most** therapeutic for a nurse to say during the assessment interview?

1. "You'll find that you'll get better faster if you try to help us to help you."
2. "Hold my hand. I know you are frightened. I will not allow anyone to harm you."
3. "I'm your nurse. I'll take you to the day room as soon as I get some information."
4. "I know this is difficult, but as soon as we are finished, I'll take you to your room."

209. A depressed older client has not been eating well since admission to the hospital. The client repeatedly states, "No one cares." What is the nurse's **most** appropriate response?

1. "We all care about you; now please eat."
2. "We all care about you; you have to eat to stay alive."
3. "I care about you. What are some foods you especially like?"
4. "I care about you. Will you please eat some of this food for me?"

210. A client is admitted to the mental health unit because of a progressively increasing depression over the past month. What clinical finding does a nurse expect during the initial assessment of the client?

1. Elated affect related to reaction formation
2. Loose associations related to thought disorder
3. Physical exhaustion resulting from decreased physical activity
4. Diminished verbal expression caused by slowed thought processes

211. A nurse is planning care for a depressed client. Which approach is **most** therapeutic?

1. Allowing the client time to complete activities
2. Helping the client focus on the family support system

3. Encouraging the client to perform menial, repetitious tasks
  4. Telling the client repeatedly that the staff views the client as worthwhile
212. What is **most** appropriate for a nurse to say when interviewing a newly admitted depressed client whose thoughts focus on feelings of worthlessness and failure?
1. "Tell me how you feel about yourself."
  2. "Tell me what has been bothering you."
  3. "Why do you feel so bad about yourself?"
  4. "What can we do to help you while you are here?"
213. A client whose depression is beginning to lift remains aloof from the other clients on the mental health unit. How can a nurse help the client to participate in an activity?
1. Find solitary pursuits that the client can enjoy.
  2. Speak to the client about the importance of entering into activities.
  3. Ask the health care provider to speak to the client about participating.
  4. Invite another client to take part in a joint activity with the nurse and the client.
214. Which activity is **most** appropriate for a nurse to introduce to a depressed client during the early part of hospitalization?
1. Board game
  2. Project involving drawing
  3. Small aerobic exercise group
  4. Card game with three other clients
215. A withdrawn client refuses to get out of bed and becomes upset when asked to do so. What nursing action is **most** therapeutic?
1. Require the client to get out of bed.
  2. Stay with the client until the client calms down.
  3. Give the client the prn antipsychotic that is prescribed.
  4. Leave the client alone in bed for as long as the client wishes.
216. A client with the diagnosis of bipolar disorder, depressive episode, has been hospitalized on a psychiatric unit for 1 week. What is the **most** appropriate activity for this client?
1. Complete a jigsaw puzzle alone.
  2. Play a game of cards with several other clients.
  3. Talk with the nurse several times during the day.
  4. Engage in a game of Ping-Pong with another client.
217. During a special meeting to discuss the unexpected suicide of a recently discharged client, a nurse overhears another client moan softly, "I'm next. Oh, my God, I'm next. They couldn't protect that person, and they can't protect me." What is the nurse's **most** therapeutic response?
1. "That person was a lot sicker than you are."
  2. "You seem to be afraid you will hurt yourself."
  3. "It's different. The other person was home, while you are here."
  4. "There is no need to worry. We will protect you even after you are discharged."
218. A depressed client is concerned about many fears that are upsetting and frightening and expresses a feeling of having committed the "unpardonable sin." What is the nurse's

**most** therapeutic response?

1. "Your family loves you very much."
2. "You do understand that you really are not a bad person."
3. "You know these feelings are in your imagination and are not true."
4. "Your thoughts are part of your illness and will change as you improve."

219. A client who attempted suicide by slashing the wrists is transferred from the emergency department to a mental health unit. What are the important nursing interventions when the client arrives on the unit? **Select all that apply.**

1. Obtain vital signs.
2. Assess for suicidal thoughts.
3. Institute continuous monitoring.
4. Initiate a therapeutic relationship.
5. Inspect the bandages for bleeding.

220. A nurse plans to evaluate a newly admitted depressed client's potential for suicide. What is the **best** approach to obtain this information?

1. Question the client about plans for the future.
2. Inquire whether the client is now considering suicide.
3. Discuss suicide with other clients while the client is in the group.
4. Ask family members whether the client has ever attempted suicide.

221. A client with major depression that includes psychotic features tells the nurse, "All my relatives have been killed because I have been sinful and need to be punished." What is the **primary** focus of nursing interventions?

1. Protect the client against any suicidal impulses.
2. Support the client's interest in the outside world.
3. Help the client manage the concern for family members.
4. Reassure the client that past behaviors are not being punished.

222. A client is admitted to the mental health unit after attempting suicide. When a nurse approaches, the client is tearful and silent. What is the nurse's **best** initial intervention?

1. Observe the behavior, record it, and notify the health care provider.
2. Sit quietly next to the client and wait for the client to start speaking.
3. Say, "You are crying. That means you feel badly about attempting suicide and really want to live."
4. Say, "I see you are tearful. Tell me about what is going on in your life, and we can work on helping you."

223. A nurse has been assigned to work with a depressed client on a one-to-one basis. The next morning the client refuses to get out of bed, stating, "I'm too sick to be helped, and I don't want to be bothered." What is the nurse's **best** response?

1. "You will not feel better unless you make the effort to get up and get dressed."
2. "I know you will feel better again if you could just make an attempt to help yourself."
3. "Everyone feels this way in the beginning as they confront their feelings. I'll sit down with you."
4. "I know you don't feel like getting up, but you may feel better if you do. Let me help you get started."

224. A frail, depressed client frequently paces the halls, becoming physically tired from the activity. What action should the nurse take to help reduce this activity?

1. Have the client perform simple, repetitive tasks.
2. Ask the client's health care provider to prescribe a sedative.
3. Restrain the client in a chair, thus reducing the opportunity to pace.
4. Place the client in a single room, thus limiting pacing to a smaller area.

225. A nurse sits with a depressed client twice a day, although there is little verbal communication. One afternoon, the client asks, "Do you think they'll ever let me out of here?" What is the nurse's **best** reply?

1. "We should ask your doctor."
2. "Everyone says you're doing fine."
3. "Do you think you are ready to leave?"
4. "How do you feel about leaving here?"

226. A nurse is working with a client with a major depressive episode. What is a long-term goal for this client?

1. Talk openly about the depressed feelings.
2. Identify and use new defense mechanisms.
3. Discuss the unconscious source of the anger.
4. Verbalize realistic perceptions of self and others.

227. A depressed client states, "I am no good. I'm better off dead." What is the **priority** nursing intervention?

1. Stating, "I think you're good; you should think of living."
2. Alerting the staff to schedule 24-hour observation of the client
3. Responding, "I will stay with you until you are less depressed."
4. Unobtrusively removing those articles that may be used in a suicide attempt

228. What is a therapeutic nursing action when caring for a depressed client?

1. Playing a game of chess with the client
2. Allowing the client to make personal decisions
3. Sitting down next to the client at frequent intervals
4. Providing the client with frequent periods of time for reflection

229. A teenager recently committed suicide, and grief counselors have been working with students. What behaviors indicate to the school nurse that a student may be considering suicide? **Select all that apply.**

1. Withdrawing from friends
2. Giving away prized possessions
3. Memorializing the dead teenager
4. Talking excessively about the event
5. Becoming involved in student activities

230. A client with a diagnosis of major depression refuses to participate in unit activities because of being "just too tired." What is the nurse's **best** approach?

1. Plan one rest period during each activity.
2. Explain why the staff believes the activities are therapeutic.
3. Encourage the client to express negative feelings about the activities.

4. Accept the client's feelings about activities calmly, while setting firm limits.
231. A nurse stops by the room of a tearful, newly admitted depressed client and offers to walk with the client to the evening meal. The client looks intently at the nurse, saying nothing. What is the nurse's **best** response?
1. "I'll be at the desk if you need me."
  2. "You must tell me what you are feeling now."
  3. "We will walk together to dinner when you calm down."
  4. "It may be very difficult for you to be on a psychiatric unit."
232. A client is admitted to the psychiatric hospital after many self-inflicted nonlethal injuries over the last month. Which level of suicidal behavior is reflective of the client's behavior?
1. Threats
  2. Gestures
  3. Attempts
  4. Ideations
233. A nurse moves into the working phase of a therapeutic relationship with a depressed client who has a history of suicide attempts. What question should the nurse ask the client when exploring alternative coping strategies?
1. "How have you managed your problems in the past?"
  2. "What do you feel you have learned from this suicide attempt?"
  3. "How will you manage the next time your problems start piling up?"
  4. "Were there other things going on in your life that made you want to die?"
234. A nurse is assigned to care for a depressed client on a day when the client seems more withdrawn and depressed than usual. Which nursing intervention is **most** appropriate?
1. Remain visible to the client.
  2. Involve the client in group activities.
  3. Spend a few extra minutes with the client throughout the day.
  4. Ask the client if it would help if you both sat together for a while.
235. A nurse is discharging a client from the mental health unit who has been treated for major depression. Which statement is **most** therapeutic at this time?
1. "I am going to miss you; we have become good friends."
  2. "I know you are really going to be all right when you go home."
  3. "Call the contact number you were given if you have an emergency."
  4. "This is my phone number; call me to let me know how you are doing."
236. On the second day after admission, a suicidal client asks a nurse, "Why am I being watched around the clock, and why can't I walk around the entire unit?" Which reply is **most** appropriate?
1. "Why do you think we are observing you?"
  2. "What makes you think we are observing you?"
  3. "We are concerned that you might try to harm yourself."
  4. "We are following your doctor's orders, so there must be a reason."
237. After 4 days on the inpatient psychiatric unit, a client on suicidal precautions tells

the nurse, "Hey, look! I was feeling pretty depressed for a while, but I'm certainly not going to kill myself." What is the nurse's **best** response to this statement?

1. "You do seem to be feeling better."
2. "We should talk some more about this."
3. "We have to observe you until you are better."
4. "I don't understand what you mean by killing yourself."

238. During a group discussion, it is learned that a group member hid suicidal urges and committed suicide several days ago. The nurse leading the group should be prepared to manage the:

1. guilt of the co-leaders that they failed to anticipate and prevent the suicide.
2. guilt that group members feel because they could not prevent another's suicide.
3. lack of concern over the suicide expressed by several of the members in the group.
4. fear by some members that their own suicidal urges may go unnoticed and unprotected.

239. What treatment should a nurse anticipate will be ordered for a client with severe, persistent, intractable depression and suicidal ideation?

1. Electroconvulsive therapy
2. Short-term psychoanalysis
3. Nondirective psychotherapy
4. High doses of anxiolytic drugs

240. A severely depressed client is to have electroconvulsive therapy (ECT). What should a nurse include when discussing this therapy with the client?

1. Sleep will be induced and treatment will not cause pain.
2. Treatment is totally safe with the new methods of administration.
3. You can ask any question you like, but it is better not to talk about it.
4. There may be some unrecoverable short-term and long-term memory loss.

241. An extremely depressed client signed the consent for electroconvulsive therapy (ECT) but continues to express anxiety about the procedure. What is **most** important for a nurse to emphasize when discussing ECT with the client?

1. "The procedure may cause a headache."
2. "The procedure will make you feel better."
3. "You will not be left alone during the procedure."
4. "You will have periods of amnesia after the procedure."

242. A nurse is assisting with the administration of electroconvulsive therapy (ECT) to a severely depressed client. What side effect of the therapy should the nurse anticipate?

1. Loss of appetite
2. Postural hypotension
3. Complete temporary loss of memory
4. Confusion immediately after the treatment

243. When a nurse sits next to a depressed client and begins to talk, the client states, "I'm stupid and useless. Talk with the other people who are more important." Which response is **most** therapeutic?

1. "Everyone is important."

2. "Do you feel that you are not important?"
  3. "Why do you feel you are not important?"
  4. "I want to talk with you because you are important to me."
244. A client is admitted to a mental health facility for depression. What action should a nurse take to help the client develop a positive self-regard?
1. Set limits on the client's negative behaviors.
  2. Involve the client in activities that promote success.
  3. Demonstrate approval of the client's efforts at every opportunity.
  4. Encourage the client to participate in activities with other clients.
245. A depressed client tells a nurse, "I want to die." Which is the nurse's **most** therapeutic response?
1. "You would rather not live."
  2. "You are not alone in feeling this way."
  3. "When was the last time you felt this way?"
  4. "Do you believe that there is life after death?"
246. A client exhibiting manic behavior is admitted to the psychiatric hospital. In which room should the nurse manager place the client?
1. One that has basic simple furnishings
  2. One with another client who is very quiet
  3. A room that will provide a variety of stimuli
  4. A room with another client exhibiting similar behavior
247. During the orientation tour for three new staff members, a young, hyperactive manic client greets them by saying, "Welcome to the funny farm. I'm Jo-Jo, the head yo-yo." Which meaning can the nurse assign to the client's statement?
1. Trying to fill the "life-of-the-party" role
  2. Looking for attention from the new staff
  3. Unable to distinguish fantasy from reality
  4. Anxious over the arrival of new staff members
248. What is the **best** nursing intervention when the language of a client in the manic phase of a bipolar disorder becomes vulgar and profane?
1. State, "We do not like that kind of talk around here."
  2. Ignore it, since the client is using it to gain attention.
  3. Recognize that the behavior is part of the illness, but set limits on it.
  4. State, "We will talk to you when you can speak in an acceptable way."
249. A client with bipolar disorder, manic episode, has a superior, authoritative manner and constantly instructs other clients about how to dress, what to eat, and where to sit. The nurse should intervene because these behaviors eventually will cause the other clients to feel:
1. angry.
  2. dependent.
  3. inadequate.
  4. ambivalent.
250. A client with the diagnosis of bipolar disorder, manic episode, is extremely active,

talks constantly, and tends to badger the other clients, some of whom are now becoming agitated. What is the **best** strategy for a nurse to use with this client?

1. Humor
2. Sympathy
3. Distraction
4. Confrontation

251. What therapeutic nursing intervention may redirect a hyperactive, manic client?

1. Suggesting that the client write a short story
2. Having the client initiate group social activities on the unit
3. Asking the client to guide other clients as they clean their rooms
4. Encouraging the client to tear pictures out of magazines for a scrapbook

252. A nurse is caring for a hyperactive, manic client who exhibits flight of ideas and is not eating. What may be the reason why the client is not eating?

1. Feels undeserving of the food
2. Is too busy to take the time to eat
3. Wishes to avoid others in the dining room
4. Believes that there is no need for food at this time

▶253. A client who is in a manic phase of bipolar disorder threatens staff and clients on an acute psychiatric unit. Place the following interventions in **priority** order from the **least** restrictive to the **most** restrictive.

1. \_\_\_\_\_ Seclusion
2. \_\_\_\_\_ Restraints
3. \_\_\_\_\_ Limit setting
4. \_\_\_\_\_ Diversional activities
5. \_\_\_\_\_ Medication administration

254. A psychologist has been a client on a mental health unit for 3 days. The client has questioned the authority of the treatment team, advised other clients that their treatment plans are wrong, and has been disruptive in group therapy. What is the nurse's **most** appropriate intervention?

1. Tell the other clients to disregard what the client is saying.
2. Ignore the client's disruptive behavior and wait until it subsides.
3. Restrict the client's contact with other clients until the disruptive behavior ceases.
4. Accept that the client is unable to control this behavior, and set appropriate limits.

255. How should the nursing staff provide for the nutritional needs of a client experiencing periods of extreme mania and hyperactivity?

1. Accept that the client will eat if hungry.
2. Allow the client to prepare meals to eat when desired.
3. Offer high-calorie snacks frequently that the client can hold.
4. Leave food in the client's room that can be eaten when desired.

256. A client is admitted to a psychiatric hospital after a month of unusual behavior that included eating and sleeping very little, talking and singing constantly, and going on frequent shopping sprees. In the hospital, the client is demanding, bossy, and sarcastic. Which disorder does the nurse associate with these behaviors?

1. Bipolar disorder, manic phase
2. Antisocial personality disorder
3. Obsessive-compulsive disorder
4. Chronic undifferentiated schizophrenia

257. What is essential for the nurse to do when approaching a client during a period of overactivity?

1. Use a firm but caring and consistent approach.
2. Anticipate and physically control the hyperactivity.
3. Allow the client to choose the activities in which to participate.
4. Let the client know the staff will not tolerate destructive behavior.

258. What should the nurse include when developing a plan of care for a client in the manic phase of bipolar disorder?

1. Focus the client's interest in reality.
2. Encourage the client to talk as much as needed.
3. Redirect the client's excess energy to constructive channels.
4. Persuade the client to complete any task that has been started.

▶259. The nurse assesses a client with the diagnosis of bipolar disorder, manic episode. Which clinical findings support this diagnosis? **Select all that apply.**

1. Passivity
2. Dysphoria
3. Anhedonia
4. Grandiosity
5. Talkativeness
6. Distractibility

260. A depressed client often sleeps past the expected time of awakening and spends excessive time resting and sleeping. Which nursing intervention is appropriate for this client?

1. Restrict the client's access to the bedroom.
2. Offer the client a series of relaxation tapes.
3. Reschedule the client's bedtime to an earlier hour.
4. Suggest that the client exercise before going to bed.

# Nursing Care of Clients with Disorders Related to Alterations in Behavior

261. A client who is in a four-bed room since admission becomes extremely anxious and is having difficulty sleeping. What is the nurse's **best** response?

1. "You seem unable to sleep at night."
2. "I'm going to move you to a private room."
3. "I'll get you the sedative that was prescribed."
4. "You'll be able to fall asleep when you're tired."

262. During an assessment interview the client relates experiencing overwhelming, irresistible attacks of sleep. Which sleep disorder does the nurse conclude the client is experiencing?

1. Insomnia
2. Narcolepsy
3. Sleep terror
4. Sleep apnea

▶263. A client tells a nurse, "I have been having trouble sleeping and feel wide awake as soon as I get into bed." Which strategies should the nurse teach the client that will promote sleep? **Select all that apply.**

1. Eat a heavy snack near bedtime.
2. Read in bed before shutting out the light.
3. Leave the bedroom if you are unable to sleep.
4. Drink a cup of warm tea with milk at bedtime.
5. Exercise in the afternoon rather than in the evening.
6. Count backward from 100 to 0 when your mind is racing.

▶264. A nurse is assessing a client with a diagnosis of primary insomnia. Which findings from the client's history may be the cause of this disorder? **Select all that apply.**

1. Chronic stress
2. Severe anxiety
3. Generalized pain
4. Excessive caffeine
5. Chronic depression
6. Environmental noise

265. An adolescent is admitted to the psychiatric service in stable physical condition with the diagnosis of anorexia nervosa. The adolescent has lost 20 pounds in 6 weeks and is very thin but is excessively concerned about being overweight. What is the **most** important initial nursing intervention?

1. Compliment the physical appearance of the adolescent.
2. Explore the reasons why the adolescent does not want to eat.
3. Explain the value of adequate nutrition to the adolescent.
4. Attempt to establish a trusting relationship with the adolescent.

266. What is an appropriate behavior modification goal for a client with anorexia

nervosa?

1. Eat every meal for a week.
2. Gain 1 pound of weight a week.
3. Attend group therapy every day.
4. Talk about food for 1 hour a day.

267. Evaluation of clients with anorexia nervosa requires reassessment of behaviors after admission. Which finding indicates that the therapy is beginning to become effective?

1. Food is hidden in pockets of clothing
2. Statement that the hospitalization has been helpful
3. Weight gain of six pounds since admission 3 weeks ago
4. Remains in the dining room eating for 1 hour after others have left

268. A cachectic adolescent with the diagnoses of anorexia nervosa, dehydration, and electrolyte imbalances is admitted to a mental health facility. The adolescent has been obsessed with weight, has exercised for hours every day, has taken enemas and laxatives several times a week, and has engaged in self-induced vomiting. Which is a **priority** when a nurse plans care for this client?

1. Identifying personal strengths
2. Controlling impulsive behaviors
3. Correcting electrolyte imbalances
4. Developing a contract for treatment goals

269. A nurse is working with clients with a variety of eating disorders. Which characteristic unique to bulimia nervosa differentiates this disorder from anorexia nervosa?

1. Is obese and attempting to lose weight
2. Has a distorted body image and sees the body as fat
3. Has behaviors and an appearance that appear appropriate
4. Is struggling with a conflict of dependence versus independence

270. What characteristic of the environment is **most** therapeutic for clients with the diagnosis of bulimia nervosa?

1. Controlling
2. Empathetic
3. Focused on food
4. Based on realistic limits

271. A college student is brought to the mental health clinic by the parents. The diagnosis is borderline personality disorder. Which factors in the client's history support this diagnosis? **Select all that apply.**

1. Impulsiveness
2. Lability of mood
3. Ritualistic behavior
4. Psychomotor retardation
5. Self-destructive behavior

272. A hospitalized client who was diagnosed with a borderline personality disorder consistently breaks the unit's rules. How will confronting the client about this behavior

help the client?

1. Controls anger
2. Reduces anxiety
3. Sets realistic goals
4. Becomes more self-aware

273. A client with a personality disorder tells a nurse, "I want to tell you something, but you must promise to keep it a secret." Which response could lead to splitting among the staff?

1. "I am part of a team that shares important information about clients."
2. "Your comments will be kept confidential because I am your advocate."
3. "I cannot promise to keep what you say confidential from the rest of the staff."
4. "Trust me to do what is in your best interests with the information, which includes discussing it with the team."

274. A nurse is working in the orientation phase of a therapeutic relationship with a client who has borderline personality disorder. What will be **most** difficult for the client at this stage of the relationship?

1. Controlling anxiety
2. Terminating the session on time
3. Accepting the psychiatric diagnosis
4. Setting mutual goals for the relationship

275. The clients on a mental health unit go on a supervised day trip to a baseball game. When returning to the bus, a client with a narcissistic personality disorder insists on leaving the group to get an autograph from a player. What is the **most** appropriate response by the nurse?

1. Hold the client by the arm to prevent leaving the group.
2. Instruct the client with a loud voice to get in the bus so the group can go home.
3. Inform the client in a matter-of-fact tone that everyone must remain with the group.
4. Tell the client that the baseball player will not be permitted to give anyone an autograph.

276. An adult is diagnosed with schizotypal personality disorder. How should a nurse describe the client's behavior?

1. Rigid and controlling
2. Submissive and immature
3. Arrogant and attention seeking
4. Introverted and emotionally withdrawn

277. A nurse begins a relationship with a client with the diagnosis of schizotypal personality disorder. What is the **best** initial nursing action?

1. Set limits on manipulative behavior.
2. Encourage participation in group therapy.
3. Respect the client's need for social isolation.
4. Recognize that seductive behavior is expected.

278. A client has the diagnosis of histrionic personality disorder. Which behavior should the nurse expect when assessing this client?

1. Boastful and egotistical
2. Rigid and perfectionistic
3. Extroverted and dramatic
4. Aggressive and manipulative

279. A client with a borderline personality disorder receives the wrong meal tray for lunch and angrily states, "The next time I see the dietician, I am going to throw this tray at her!" What is the nurse's **most** appropriate response?

1. Suggest that the client calm down and explain that sometimes trays get mixed up.
2. Inform the client that the behavior is inappropriate and send the client out of the dining room.
3. Tell the client it is frustrating not to get the correct tray, but throwing the tray at the dietician is unacceptable behavior.
4. Inform the client that throwing the tray at the dietician will make matters worse and may result in being placed in seclusion.

280. Which nursing intervention is **most** important for a client who has the diagnosis of antisocial personality disorder?

1. Teach and role-model assertiveness.
2. Use a gentle and reassuring approach.
3. Provide clear boundaries and consequences.
4. Present an empathetic and democratic approach.

281. A nurse is caring for a client with antisocial personality disorder. What client characteristic should the nurse consider when formulating a plan of care?

1. Suffers from extreme anxiety
2. Rapidly learns by experience if punished
3. Usually is unable to postpone gratification
4. Has a great sense of responsibility toward others

282. The nursing staff is discussing the **best** way to develop a relationship with a new client who has antisocial personality disorder. What characteristic of clients with antisocial personality should the nurses consider when planning care?

1. Engages in many rituals
2. Feels independent from others
3. Exhibits lack of empathy for others
4. Possesses limited communication skills

283. A client with a diagnosis of antisocial personality disorder is being discharged from the hospital. The client asks the nurse, "Can I have your phone number so that I can call you for a date." What is the nurse's **best** response?

1. "We are not permitted to date clients."
2. "It is against my professional ethics to date clients."
3. "Our relationship is professional; therefore, I will not see you socially."
4. "I'm glad you like me; however, I cannot give out my phone number."

284. A nurse identifies that a client is pretending to be ill. What does this behavior usually indicate?

1. Psychosis

2. Malingering
3. Out of contact with reality
4. Use of conversion defenses

285. A nurse is orienting a new client to the unit when another client rushes down the hallway and asks the nurse to sit down to talk. The client requesting the nurse's attention is manipulative and uses acting-out behaviors when demands are unmet. How should the nurse intervene?

1. Suggest that the client requesting attention speak with another staff member.
2. Leave the new client, saying, "I'll talk with the other client until things calm down."
3. Introduce the two clients and suggest that the client join them on a tour of the facility.
4. Tell the interrupting client, "I'll be back to talk with you after I orient this new client."

286. A client is diagnosed with an adjustment disorder with mixed anxiety and depression. What should the nurse anticipate as the client's **primary** problem?

1. Low self-esteem
2. Deficient memory
3. Intolerance to activity
4. Disturbed personal identity

287. What should a nurse identify as the **most** important factor in rehabilitation of a client addicted to alcohol?

1. Motivational readiness
2. Availability of community resources
3. Accepting attitude of the client's family
4. Qualitative level of the client's physical state

288. A client with a history of alcoholism is diagnosed with Wernicke encephalopathy associated with Korsakoff syndrome. What does the nurse anticipate will be prescribed?

1. Traditional phenothiazine
2. Judicious use of antipsychotics
3. Intramuscular injections of thiamine
4. Oral administration of chlorproMAZINE

289. A client with an alcohol dependence problem asks whether the nurse can see the bugs that are crawling on the bed. What is the nurse's initial reply?

1. "No, I don't see any bugs."
2. "I will get rid of them for you."
3. "I will stay here until you are calmer."
4. "Those bugs are a part of your sickness."

290. A recovering alcoholic joins Alcoholics Anonymous (AA) to help maintain sobriety. What type of group is AA?

1. Social group
2. Self-help group
3. Resocialization group
4. Psychotherapeutic group

291. Clients addicted to alcohol often use the defense mechanism of denial. What is the reason why this defense is so often used?

1. Reduces their feelings of guilt
2. Creates the appearance of independence
3. Helps them live up to others' expectations
4. Makes them look better in the eyes of others

292. What should a nurse conclude that a client is doing when making up stories to fill in blank spaces of memory?

1. Lying
2. Denying
3. Rationalizing
4. Confabulating

293. A nurse is discussing plans with a client who has decided to withdraw from alcohol. What should the nurse recommend as one of the **most** effective treatments for alcoholism?

1. Individual or group psychotherapy
2. Admission to an alcoholic unit in a hospital
3. Daily administration of disulfiram (Antabuse)
4. Active membership in Alcoholics Anonymous

294. A nurse uses the CAGE Screening Test for Alcoholism to determine the potential an individual has for a drinking problem. Which is one of the four questions included in this test?

1. "Do you feel you are a normal drinker?"
2. "Have you ever felt bad or guilty about your drinking?"
3. "Are you always able to stop drinking when you want to?"
4. "How often did you have a drink containing alcohol in the past year?"

295. A client in a detoxification unit has an alcohol withdrawal seizure. Diazepam (Valium) 7.5 mg intramuscularly (IM) stat is prescribed. Valium is available 5 mg/mL. How many mL should the nurse administer? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

296. A client undergoing alcohol detoxification asks about attending Alcoholics Anonymous (AA) meetings after discharge. What is the nurse's **best** initial reply?

1. "You'll find you'll need their support."
2. "What feelings do you have about going to those meetings?"
3. "They will help you to learn how to cope with your problem."
4. "Don't you think it's better to wait until you are sure you are ready?"

297. While a client is attending an Alcoholics Anonymous (AA) meeting, a nurse talks with the client's spouse about the purpose of AA. What is the priority goal of this self-help group?

1. Change destructive behavior.
2. Develop functional relationships.
3. Identify how they present themselves to others.
4. Understand their patterns of interacting within the group.

298. A client who has just begun attending Alcoholics Anonymous (AA) asks a nurse

how important it is to attend meetings regularly. What is the nurse's **best** response?

1. "It's really important if you want to get well."
2. "It's your decision about whether or not you want to attend."
3. "Do you think that attending these meetings may not be helpful?"
4. "Do you feel that it's not worth the effort to keep on attending meetings?"

299. A client with a long history of alcohol dependence spends 28 days in an alcohol rehabilitation unit. What type of referral does the nurse anticipate will be included in the discharge plan?

1. Halfway house
2. Family therapist
3. Psychoanalytic therapy group
4. Community-based self-help group

300. A client is admitted to the hospital for acute pancreatitis. The nurse obtains the client's vital signs, performs a physical assessment, and reviews the client's health history. What is the **priority** action by the nurse?

### Client Chart

#### Vital Signs on Admission

T-97.9° F

P-88 beats per minute

R-16 breaths per minute, normal depth

BP-136/88

#### Health History

Type 2 diabetes diagnosed one year ago

Smokes 1 pack daily for 40 years

States the consumption of 5 alcoholic beverages per day for 30 years

Divorced for 4 months

Laboratory results indicate anemia and leukocytopenia

#### Physical Assessment

T-99.9° F

P-118 beats per minute

R-24 breaths per minute, shallow

BP-148/96

Restlessness and agitation

1. Reduce environmental stimuli.
2. Place the client on constant observation.

3. Assess for alcohol withdrawal symptoms.
  4. Continue to monitor the client's vital signs.
301. What behavior by a client with a long history of alcohol abuse is an indication that the client may be ready for treatment?
1. Drinking only socially
  2. Not drinking for a week
  3. Hospitalization for detoxification
  4. Verbalizing an honest desire for help
302. A nurse is interviewing a client newly admitted to an outpatient program after withdrawal from alcohol. What behavior best indicates that the client has accepted that drinking is a problem?
1. Participates in scheduled counseling sessions
  2. Attends Alcoholics Anonymous meetings daily
  3. Volunteers to be a sponsor for another alcoholic
  4. Apologizes to family members for causing distress
303. A client who is a polysubstance abuser is mandated to seek drug and alcohol counseling. What is an appropriate **initial** outcome criterion for this client?
1. "Verbalizes that a substance abuse problem exists."
  2. "Discusses the effect of drug use on self and others."
  3. "Explores the use of substances and problematic behaviors."
  4. "Expresses negative feelings about the present life situation."
304. A nurse is caring for a client who is addicted to opioids and who had a major surgery. The client is receiving methadone. What is the purpose of this medication?
1. Allows symptom-free termination of opioid addiction
  2. Converts opioid use from an illicit to a legally controlled drug
  3. Provides postoperative pain control without causing opioid dependence
  4. Counteracts the depressive effects of long-term opioid use on thoracic muscles
305. A client who is addicted to opioids had emergency surgery. During the postoperative period the health care provider decreases the previously prescribed methadone dose. For what clinical manifestations should a nurse monitor the client?
1. Constipation and lack of interest in surroundings
  2. Agitation and attempts to escape from the hospital
  3. Skin dryness and scratching under the incisional dressing
  4. Lethargy and refusal to participate in therapeutic exercises
306. A client has been receiving oxycodone (OxyContin) for moderate pain associated with multiple injuries sustained in a motor vehicle collision. The client has returned three times for refills of the prescription. What behavior, in addition to the client's slurred speech, leads the nurse to suspect opioid intoxication?
1. Mood lability
  2. Hypervigilance
  3. Constricted pupils
  4. Increased respirations
307. A client is responding within an hour of receiving naloxone to combat respiratory

depression from an overdose of heroin. Why should a nurse continue to closely monitor this client's status?

1. The drug may cause peripheral neuropathy.
2. Naloxone and heroin when combined can cause cardiac depression.
3. Symptoms of the heroin overdose may return after the naloxone is metabolized.
4. Hyperexcitability and amnesia may cause the client to thrash about and become abusive.

308. What is the **primary** nursing concern when caring for a client who is grossly impaired by stimulants?

1. Drowsiness
2. Seizure activity
3. Fluid imbalance
4. Suicidal ideation

309. A client is brought to the emergency department by friends because of increasingly bizarre behavior. Which signs does a nurse identify that indicate the client was using cocaine? **Select all that apply.**

1. Euphoria
2. Agitation
3. Panic attacks
4. Slurred speech
5. Hypervigilance
6. Impaired judgment

310. A client is admitted to the drug detoxification unit for cocaine withdrawal. What is the nurse's **primary** concern while working with clients withdrawing from cocaine?

1. Risk for self-injury
2. Potential for seizure
3. Danger of dehydration
4. Probability of injuring others

311. Shortly after admission an adolescent falls to the floor and has tonic-clonic movements. There is no verbal response, but a nurse observes that the client is still chewing gum. What should the nurse do next?

1. Remove the chewing gum.
2. Document the observation.
3. Send another client for help.
4. Insert a tongue blade between the teeth.

312. A child has been hospitalized repeatedly for illnesses with unknown etiologies. Finally, the health care provider makes the diagnosis of Munchausen syndrome by proxy. What is the nurse's **most** therapeutic approach with the involved parent?

1. Confrontation
2. Open communication
3. Health teaching about child rearing
4. Validation of the child's physical status

# Nursing Care of Clients with Sexual and Gender Identity Disorders

313. Which is a frequent finding in clients with paraphiliac sexual disorders?

1. Other covert or overt emotional problems
2. Gonadal and pituitary hormone deficiencies
3. Overassociation with society's fringe groups
4. Inadequate development of the sexual organs

314. An adult client charged with molesting a child is admitted for psychiatric evaluation. When a nurse invites the client to come to dinner, the client refuses and states, "I don't want anyone to see me. Leave me alone." What is the nurse's **best** response?

1. "Certainly. I respect your wishes."
2. "You sound upset; let's talk about it."
3. "It will be easier to face other people right away."
4. "Only the staff members know why you are here."

315. A child tells the school nurse, "My father has been getting into bed with me at night and touching me." What should the nurse do next?

1. Ask the child to describe the touching.
2. Tell the teacher to report any inappropriate behavior.
3. Contact the father to come to the school immediately.
4. Report the child's conversation to child protective services.

316. A male client with the diagnosis of gender identity disorder has been dressing and functioning in society as a woman for 2 years and has decided to have sex reassignment surgery. He tells a nurse that all his life he has considered himself to be female. Place the following nursing interventions in order of priority.

1. \_\_\_\_ Treat the client with respect.
2. \_\_\_\_ Investigate own feelings about sexuality.
3. \_\_\_\_ Encourage the client to explore his feelings.
4. \_\_\_\_ Accept the decision to have sex reassignment surgery.
5. \_\_\_\_ Explore ways that the decision can be shared with significant others.

317. Sildenafil (Viagra) is prescribed for a man with erectile dysfunction. A nurse teaches the client about which common side effects of this drug? **Select all that apply.**

1. Flushing
2. Headache
3. Dyspepsia
4. Constipation
5. Hypertension

318. A male client with the diagnosis of pedophilia is admitted to the psychiatric hospital because of repeated episodes of exhibitionism. In the recreation room the client exposes himself to a nurse and begins to masturbate. How should the nurse respond?

1. Turn away from the client and ignore the behavior.
2. Tell the client that the behavior is unacceptable and to stop.

3. Remove the client from the recreation room and escort him to his own room.
4. Recognize that the behavior is part of his illness and obtain a prescription for a libido-lowering medication.

319. During a routine yearly physical an older adult says to a nurse, "I have not had sex lately because I can no longer get an erection!" What should be the nurse's **initial** response?

1. "Let's discuss this concern a little more."
2. "Be sure to tell your doctor about this problem."
3. "There is medication available for erectile dysfunction."
4. "This is an expected physiologic response to getting older."

320. What statement during a yearly physical examination indicates to a nurse that a male client may have a sexual arousal disorder?

1. "I have no interest in sex."
2. "It doesn't get hard during sex anymore."
3. "I climax almost before we even get started."
4. "It takes forever before I finally have an orgasm."

321. A 25-year-old woman with the diagnosis of bipolar disorder, manic episode, is admitted to the psychiatric unit. A nurse on the unit reviews the admission information provided by the client's husband and assesses the client. Based on the information in the chart at the right, what is an appropriate nursing intervention?

1. Assigning the client to a private room
2. Suggesting playing cards with several other clients
3. Encouraging the development of insight through introspection
4. Having the client sit at the communal dining table during meals

### Client Chart

#### Admission Information: Interview with client's husband

"My wife is 25 years old, and we have been married for 3 years. She always had a lot of energy, but lately she is constantly on the go and is acting crazy. She hardly ever sleeps, has been giving away her clothes and buying all new sexy clothes, and rarely eats. She became furious when I took the credit card away from her. She demands sex constantly, and I found out she has been having multiple affairs. Finally, I couldn't take it anymore, and I brought her to the hospital."

#### Client Assessment

Client is talking loudly and jumps from one topic to another; exhibiting constant motor activity. Client is wearing skimpy clothing without undergarments. Client states, "I like wearing my new clothes because I get turned on when people look at me." At times uses profanity, particularly when talking about how her husband took away her credit card. Client not exhibiting combative or physically assaultive behavior.

#### Vital Signs

Temperature: 99° F

Pulse: 98 beats per minute

Respirations: 22 breaths per minute Blood Pressure: 132/88
---

322. A client confides to the nurse that she enjoys engaging in sex with multiple male adult sex partners simultaneously. What is the nurse's **most** appropriate response?

1. "I recommend that you seek counseling for this problem."
2. "Don't you think that having sex with multiple sex partners is immoral?"
3. "These men are abusing you, and you should go to the police to report them."
4. "What are you using for birth control and protection from sexually transmitted infections?"

323. A client is admitted to a long-term care facility and placed in a semiprivate room. After the second night on the unit the client's roommate reports that the client is masturbating at night and demands another room. What is the nurse's **most** appropriate intervention?

1. Move the roommate who made the report to another room.
2. Provide the client who was masturbating with periods of private time.
3. Tell the roommate that this is acceptable behavior and the client has the right to engage in it.
4. Inform the client who is masturbating that this behavior is inappropriate and should not continue.

324. An adult confides to a clinic nurse, "I have urges and fantasies to have sexual relations with children." What is the nurse's **most** appropriate response?

1. Ask the client, "Have you ever acted on these thoughts?"
2. Explain that these thoughts are unacceptable and intensive therapy is needed.
3. Question the client, "Are you able to control your thoughts about sexual relations with children?"
4. Inform the appropriate child protective services about the client and the thoughts the client has reported.

325. A 67-year-old man with type 2 diabetes sadly confides in the nurse that he has been unable to have an erection for several years. What is the **best** response by the nurse?

1. "At your age sex is not that important."
2. "Sex isn't what it is cracked up to be."
3. "You sound upset about not being able to have an erection."
4. "Maybe it is time that you speak to your health care provider about this."

## Answers and Rationales

---

# Foundations of Mental Health/Psychiatric Nursing

1. **3 This is the age of Freud's phallic stage and Erikson's stage of initiative versus guilt.**  
**1** This age is Freud's genital stage and Erikson's stage of identity versus role confusion. **2** This age is Freud's latency stage and Erikson's stage of industry versus inferiority. **4** This age is Freud's oral stage and Erikson's stage of trust versus mistrust.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;  
**Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Formation of the Personality
2. **4 Children view their own worth by the response received from their parents. This sense of worth sets the basic ego strengths and is vital to the formation of the personality.**  
**1** Peer groups come later in a child's development, but the parent-child relationship is still the most important. **2** Although important, it is not as important as the parent-child relationship. **3** This comes later in life, after the basic personality has been formed.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;  
**Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Formation of the Personality
3. **4 When acting out against the primary source of anxiety creates even further anxiety or danger, the individual may use displacement to express feelings toward a safer person or object.**  
**1** This is an example of denial. **2** This reflects an inability to mature and accept responsibility. **3** This is fantasy.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms
4. **4 When the individual experiences a threat to self-esteem, anxiety increases and defense mechanisms are used to protect the self.**  
**1** Affective reactions are mood disorders. **2** Withdrawal patterns are deviant ways of coping with stress; if carried to an extreme, behavior can become pathologic. **3** Ritualistic behaviors are not an aspect of the developmental process.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms
5. **1 The client is using the cognitive distortions of overgeneralization and pessimism. Negative events are magnified and become the focus, while contrary positive experiences are minimized and ignored. By focusing on the negative, the depressive mood is reinforced.**  
**2, 3, 4** There are no data to support this conclusion.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Cognitive Theory
6. **3 By developing skills in one area, the individual compensates for a real or imagined deficiency, thereby maintaining a positive self-image.**  
**1** If the student incorporated the qualities of the college athlete, that would be introjection. **2** Sublimation is related to unacceptable impulses that may pose a threat. **4** This person is not trying to make amends for unacceptable feelings (reaction

formation) but rather for a believed deficiency and an inadequate self-image.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms

**7. 1 Fears and anxieties about themselves and their possessions are common in older adults because of a decreased self-concept and an altered body image; these changes result in a decreased ability to cope.**

**2** Aging need not necessarily bring about losing one's ability to cooperate. **3** The attitude of older adults concerning authority or others in their environment is set; indecision about life situations may be due to insecurity. **4** This behavior is noted in the middle stage of Alzheimer disease; usually it is not observed in older adults.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 15, Formation of the Personality

**8. 2 Use of denial involves failure to acknowledge the reality of a situation.**

**1, 3** This is not demonstrated in this situation. **4** Intellectualization involves discussing the child's problem in a technical manner; this is not demonstrated in this situation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms

**9. 2 New methods of coping with situations require modifications of approach and attitudes; hence personality is always capable of change.**

**1** Certain personality traits are established by age 2, but not the total personality. **3** The capacity for change exists throughout the life cycle. **4** Accepting this theory denies the fact that the personality is capable of change throughout life.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Formation of the Personality

**10. 4 The child is in Piaget's stage of preoperational thought, which is manifested by magical thinking; therefore, teaching should also use magical thinking.**

**1** This statement is too technical and does not take into account the child's preoperational stage of development. This statement is appropriate for an adolescent in the formal operational stage of cognitive development. **2** This statement is too direct and does not consider the child's cognitive developmental stage of preoperational thought. This statement is appropriate for an adolescent in the formal operational stage of cognitive development. Also, the use of the word "shots" may precipitate anxiety. **3** This statement is too direct and does not consider the child's cognitive developmental stage of preoperational thought. This statement is appropriate for an adolescent in the formal operational stage of cognitive development.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 15, Formation of the Personality

**11. 2 The toddler is learning autonomy, but because of the nature of development, there is still physical and emotional dependence on the parents.**

**1** The major task during infancy is the development of trust. **3** School-age children cope with the task of industry and developing skills for working in and relating to the

world. **4** Preschool-age children cope with developing a sense of initiative.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Formation of the Personality

**12. Answer: 2, 3, 5.**

**1** At 2 to 7 years of age children are in the preoperational stage of cognitive development. They believe that external, unrelated, concrete phenomena cause illness. **2** At 17 years of age the adolescent is in the formal operational stage of cognitive development and therefore is able to understand the seriousness of leukemia. **3** At 17 years of age the adolescent is in the formal operational stage of cognitive development and therefore understands the seriousness of the illness. The statement also reflects an adolescent's preoccupation with peer socialization. **4** At 7 to 10 years of age children are in the concrete operational stage of cognitive development. Because of their egocentrism, they believe that they are responsible for situations, such as illnesses, and are being punished. **5** At 17 years of age the adolescent is in the formal operational stage of cognitive development and therefore is able to comprehend the seriousness of leukemia and the need for treatment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:**

Ch 15, Formation of the Personality

**13. 1 An 11-year-old child generally is in Erikson's stage of industry versus inferiority, which involves the mastery of skills; the child did not master the skill of lawn mowing. Also, the child will be entering adolescence (stage of identity versus confusion) when major physical and emotional changes occur in relation to how one is perceived by the self and by others.**

**2** A 35-year-old adult generally is in Erikson's stage of intimacy versus isolation and thus is less concerned about proving industriousness and has moved through the stage of identity versus confusion. **3** A 55-year-old adult generally is in the stage of generativity versus stagnation and is therefore less concerned about being industrious and has moved through the stage of identity versus confusion. **4** A 70-year-old adult generally is in Erikson's stage of ego integrity versus despair and is less concerned about becoming industrious and has moved through the stage of identity versus confusion.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Formation of the Personality

**14. 3 A 7-year-old child should be more concerned with same-gender relationships. A child demonstrating a strong attraction to opposite-gender relations should be questioned further regarding the possibility of sexual abuse.**

**1** This statement is not unusual because 7-year-old children usually are attracted to a colorful environment. **2** This statement is not unusual because 7-year-old children will want the presence of a trusted parent when experiencing stress. **4** This statement is not unusual because 7-year-old children will want the support of a trusted person when experiencing stress.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:**

Ch 15, Formation of the Personality

**15. 2 Children 2 to 7 years old have difficulty distinguishing reality from fantasy, which may increase fears.**

**1** Children from birth to 1 year of age focus on “in the moment” thinking; preoperative preparation most likely will not be recalled. **3** Children 12 to 16 years of age can think in the abstract and have the ability to solve complex problems; children in this stage usually do not pose difficulties in preoperative teaching. **4** Children 7 to 11 years of age have the ability to comprehend and visualize a series of events and can think about the past and present; this stage provides less of a challenge to absorb preoperative teachings.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 15, Formation of the Personality

**16. 1 This response provides an opportunity to explore feelings.**

**2** This is a confrontational response that may place the parent on the defensive. **3** It is the nurse’s responsibility to assess the parent’s concerns before planning further interventions. **4** This is a judgmental, nontherapeutic response that may further increase the parent’s concerns.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**17. 1 Talking in the third person reflects poor ego boundaries and a dissociation from the real self.**

**2** Transference is the movement of emotional energy and feelings that one has for one person to another person. **3** Displacement is the attempt to reduce anxiety by transferring the emotions associated with one object or person to another. **4** Identification is an attempt to increase self-esteem by acquiring the attributes or characteristics of an admired individual.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms

**18. 1 Splitting is the compartmentalization of opposite-affect states and failure to integrate the positive and negative aspects of self or others.**

**2** Ambivalence is the experience of feeling opposite emotions at the same time. **3** Passive aggression is the expression of hostility toward another in an indirect, nonassertive way. **4** Reaction formation is the expression of unacceptable desires by adopting opposite behaviors in an exaggerated way.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms

**19. 3 Conscience and a sense of right and wrong are expressed in the superego, which acts to counterbalance the id’s desire for immediate gratification.**

**1** This does not reflect any part of the self. **2** This is the id seeking satisfaction. **4** A

healthy ego can delay gratification and is in balance with reality.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 15, Factors Involved in Personality Development

**20. 2 Repression is a coping mechanism in which unacceptable feelings are kept out of conscious awareness; later, under stress or anxiety, thoughts or feelings surface and come into one's conscious awareness.**

**1** Isolation is the separation of a thought from a feeling tone. **3** Regression is the use of an unconscious coping mechanism through which a person avoids anxiety by returning to an earlier, more satisfying, or comfortable time in life. **4** Introjection is the integration of the beliefs and values of another into one's own ego structure.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms

**21. 4 Intellectualization occurs when a painful emotion is avoided by means of a rational explanation that removes the event from any personal significance.**

**1** Projection is attributing unacceptable thoughts and feelings to others. **2** Dissociation is a means of handling conflict by a temporary alteration of consciousness or identity; amnesia is an example. **3** Displacement is the discharging of a pent-up feeling, generally hostility, on an object or person perceived to be weaker than the person who aroused the feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms

**22. 1 The sense of ego integrity comes from satisfaction with life and acceptance of what has been and what is. Despair reflects guilt or remorse over what might have been.**

**2** During puberty adolescents attempt to find themselves and integrate values with those of society; an inability to solve conflict results in confusion and hinders mastery of future roles. **3** During early and middle adulthood the individual is concerned with the ability to produce and to care for that which is produced or created; failure during this stage leads to self-absorption or stagnation. **4** Autonomy is developed during the toddler period; this is the ability to control the body and environment; doubt can result when the child is made to feel ashamed or embarrassed.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Formation of the Personality

**23. Answer: 4, 5.**

**1** This reflects a behavioral approach. **2** This reflects a psychoanalytic approach. **3** This reflects a behavioral approach. **4** Cognitive therapy seeks to find underlying self-defeating beliefs and replace them with more reality-based positive beliefs. **5** Cognitive therapy encourages the use of cognitive restructuring (cognitive reframing) through positive self-talk and rational mindset.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 15, Cognitive Theory

**24. 3 These behaviors are evidence of the client's ability to act responsibly.**

- 1, 2** Although this shows an improvement, it is not related to the critical element of behavioral therapy. **4** Verbalizations without actions do not show the improvement in behavior sought in behavioral therapy.
- Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 15, Behavioral Theory
- 25. 4 Displacement is a defense mechanism in which one's pent-up feelings toward a threatening person are discharged on less-threatening others.**
- 1** Repression is the unintentional putting out of the mind unacceptable or troubling thoughts, desires, or experiences. **2** Transference is a mechanism by which affects or emotional tones are shifted from one individual to another; it is unrelated to child abuse. **3** Manipulation is a mechanism by which individuals attempt to manage, control, or use others to suit their own purpose or to gain an advantage; it is unrelated to child abuse.
- Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Defense Mechanisms
- 26. 1 Mild anxiety motivates one to action, such as learning or making changes. Higher levels of anxiety tend to blur the individual's perceptions and interfere with functioning.**
- 2** Attention is severely reduced by panic. **3** The perceptual field is greatly reduced with severe anxiety. **4** The perceptual field is narrowed with moderate anxiety.
- Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 15, Anxiety and Coping Behaviors, Overview
- 27. 3 The client's early arrival indicates an expected degree of anxiety; the quiet waiting indicates that the client has been told what to expect.**
- 1** This indicates an inadequate explanation or the inability of the client to remember the explanation that had been given. **2, 4** This indicates a high degree of anxiety that may denote a fear of the tests because they were not adequately explained.
- Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 15, Anxiety and Coping Behaviors, Overview
- 28. 4 Anxiety is a human response, causing both physical and emotional changes that everyone experiences when faced with stressful situations.**
- 1** Anxiety is experienced to a greater or lesser degree by every person. **2** The fear may be related to a specific aspect of, rather than the total, environment. **3** Anxiety does not operate from the conscious level.
- Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 15, Anxiety and Coping Behaviors, Overview
- 29. 3 The individual using sublimation attempts to fulfill desires by selecting a socially acceptable activity rather than one that is socially unacceptable.**
- 1** This is reaction formation. **2** This is regression. **4** This is repression.
- Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

# The Practice of Mental Health/Psychiatric Nursing

30. **Answer: 2, 3, 5.**

**1** Registered nurses may use counseling interventions but may not perform psychotherapy; the members of the nursing team permitted to perform psychotherapy are psychiatric/mental health clinical nurse specialists and psychiatric/mental health nurse practitioners. **2** Health promotion is within the legal scope of nursing practice. **3** Case management is within the legal scope of nursing practice. **4** Only those who are legally licensed to prescribe medications, such as psychiatric nurse practitioners, may do so. **5** Treating human responses is within the legal scope of nursing practice.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, The Nurse's Responsibilities in Relation to the Law

**31. 2 New orders must be written each time a client requires restraints. When a client is acting out, the nurse may use restraints or a seclusion room and then obtain the necessary order.**

**1, 4** PRN restraint orders are not permitted. **3** Less restrictive interventions should be used when the client begins to act out; restraints are used as a last resort.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Legal Concepts Related to Mental Health/Psychiatric Nursing, Overview

**32. 4 The purpose of a PAD is to allow psychiatric clients the opportunity to provide input into future treatment decisions.**

**1** Having a surrogate decision maker can assist in ensuring the client's wishes are followed. A client can have both a PAD and a health care proxy. **2** The client cannot dictate what treatments will be offered or given. The health care provider and treatment team will decide on a plan of care, which the client may accept or reject. **3** If the client is a threat to self or others, involuntary admission may be required whether a PAD exists or not.

**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Legal Concepts Related to Mental Health/Psychiatric Nursing, Overview

**33. 1 An important aspect of the role of the psychiatric nurse is primary, secondary, and tertiary interventions to promote emotional equilibrium.**

**2, 3** This is only a small part of the role of the psychiatric nurse, a role usually shared with others on the health team. **4** This is only a part of the role of the psychiatric nurse, since psychiatry is concerned with people with varying degrees of mental and emotional disorders.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, General Nursing Care of Clients with Mental Health/Psychiatric Problems

**34. 4 This simply states facts without getting involved in role conflict.**

- 1** Being a physician is a big part of this client's self-esteem, and by this remark the nurse is threatening that self-esteem. **2** This will confuse the client's role on the unit. A client who is a physician cannot be responsible for checking vital signs. **3** Threats will make the situation worse and set the tone for future negative nurse-client interactions.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview
- 35. 3 The nurse's major tool in mental health nursing is the therapeutic use of self. Mental health nurses must learn to identify their own feelings and understand how they affect the situation.**
- 1, 2** Although this may be difficult, an awareness of self is still the most difficult. **4** This implies that the nurse is working alone in caring for the client.  
**Client Need:** Management of Care; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview
- 36. 4 This statement does not prejudge the parent; it encourages communication.**
- 1** This response disregards the parent's feelings and cuts off further communication. **2** This statement may stop communication and does not recognize the parent's concerns. **3** This statement is premature and does not recognize the parent's concerns.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview
- 37. 2 This statement encourages the client to express and explore feelings; also, it is open and nonjudgmental.**
- 1, 4** This puts the client on the defensive rather than encouraging verbalization of feelings. **3** This does not encourage further conversation, and the client will not have the opportunity to express feelings; this response focuses on the nurse rather than on the client.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview
- 38. 2 With transference a client assigns to someone the feelings and attitudes originally associated with an important significant other.**
- 1** With regression a client reverts to past levels of coping to reduce anxiety. **3** With reaction formation a client displays the exact opposite behavior, attitude, or feeling to that which is demonstrated in a given situation. **4** Cognitive distortions are thought patterns that exaggerate reality or are irrational, such as black-and-white thinking or overgeneralization.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview
- 39. 1 The nurse brings to a therapeutic relationship the understanding of self and basic**

**principles of therapeutic communication; this is the unique aspect of the helping relationship.**

**2, 3, 4** This supports the psychotherapeutic management model, but it is not the most important tool used by the nurse in a therapeutic relationship.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview

**40. 4 In the Latino culture, usually there is a strong family bond, and the support of the family is essential during problematic times.**

**1** Socioeconomic status does not play more than the usual role in deciding on appropriate health care options. **2** Latino clients tend to be present, not future, time oriented. **3** Latino clients frequently believe in fate and that outcomes are influenced by external controls (e.g., divine being, authority figures).

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, General Nursing Care of Clients with Mental Health/Psychiatric Problems

**41. Answer: 3, 4.**

**1, 2** This statement does not indicate that the client plans to harm self or others. **3** This statement indicates a suicide threat; it is a direct expression of intent but without action. **4** The threat to harm others must be heeded; the client must be protected from self harm as well as harming others. **5** This statement reflects the client's feelings of anger and the cause, but does not indicate a threat to self or others.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 16, Legal Concepts Related to Mental Health/Psychiatric Nursing, Overview

**42. 1 Self-help group members share similar experiences and can provide valuable understanding and support to each other.**

**2, 4** Although this may occur, it is not the primary purpose of self-help groups. **3** Self-help groups provide an opportunity for people to interact, not engage in professional psychotherapy.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Group Therapy

**43. 4 This reflective statement allows the client to either validate or correct the nurse.**

**1** This delays addressing the problem and avoids exploring feelings. **2** This is a response that gives advice and does not allow the client to explore feelings. **3** This denies the client's statement and does not allow the exploration of feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Group Therapy

**44. 3 This permits the client to see that personal feelings are not unique but are shared by others.**

**1** This statement makes the client worry about not feeling happy. **2** This is a

nonsupportive response to a realistic fear of leaving the safe hospital and going back to where problems must be confronted. **4** How the others feel about whether the client is ready to be discharged is irrelevant.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Group Therapy

**45. 2 The leader should not intervene at this point; the client addressed the statement to the group, and the group response should be fostered.**

**1** This response may be viewed as aggressive and may make other members fearful of contributing because they might be confronted. **3** This denies the client's feelings. **4** This response may be viewed as aggressive and may make other members fearful.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Group Therapy

**46. 2 Situational crises involve an unanticipated loss, such as a divorce, that is threatening to the client.**

**1** Social crises involve multiple losses such as those occurring during major disasters. **3** Maturational crises occur in response to stress experienced as one struggles with developmental tasks. **4** Developmental (maturational) crises are associated with developmental tasks; divorce is not a developmental task.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 16, Crisis Intervention, Overview

**47. 2 This provides an opportunity for the other clients to voice and share feelings and to identify and separate real from imaginary fears; an open expression of feelings allows the nurse to address clients' fears and provide reassurance.**

**1** Ignoring the situation denies reality and may precipitate or reinforce feelings of vulnerability and fear in the other clients. **3** This denies clients' concerns, which may increase their anxiety and fear. **4** This may meet the needs of these two clients but ignores the needs of the other clients.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Therapeutic Milieu, Overview

**48. 4 Once the client is agitated, trying to teach any information is not effective and may increase the client's anxiety. Teaching relaxation techniques can be done when the client calms down.**

**1** Being assertive (not aggressive) shows the client the nurse is confident in handling the situation. This may help reduce the client's anxiety. **2** Responding before agitation escalates makes interventions more likely to be successful. **3** Providing choices may help the client feel less threatened and avoids a power struggle.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Assertiveness Training

**49. 1 Individuals with a borderline personality disorder are impulsive and have difficulty identifying and respecting boundaries in relation to others.**

**2** Exploration of this topic in a meaningful manner can occur only after an ongoing relationship has been established. **3** Feeling victimized is a frequent theme among clients with this disorder; however, they rarely have the insight to initiate discussion of these feelings and usually show resistance when the topic is mentioned. **4** An individual with a borderline personality disorder may not be able to spend this length of time having a meaningful discussion with the nurse; usually they are too impulsive to engage in consistent work until a therapeutic relationship has been established.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**50. 3 Crying is a release, but the individual should have developed effective coping mechanisms by this time. The co-worker may need help with the grieving process.**

**1** Excessive crying 16 months after the death of a loved one is not considered an expected response. **2** People express grief in a variety of ways, not necessarily by crying. **4** This is an assumption and is not a valid conclusion.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**51. 1 The most significant factor in either precipitating or avoiding a crisis is not the events but how the individual perceives them.**

**2** Changes in role may occur, but again, the individual's perception of these changes is most influential. **3** This may be a factor, but perception is most important. **4** This is not a significant factor; the family may provide support and a crisis can still occur.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Overview

**52. 2 Crisis intervention is short-term therapy with the major goal of restoring clients to their precrisis state.**

**1** This is not a goal but an action to help achieve a goal; it is not part of crisis intervention. **3** This is not a goal, but rather an intervention that may be necessary if psychologic equilibrium cannot be restored. **4** This is not always necessary for clients to be able to function effectively.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Overview

**53. Answer: 1, 4.**

**1** A client in crisis needs to rely on available support systems for assistance; therefore, it is vital for the nurse to identify the client's support system. **2** Nothing in the history demonstrates that psychotic thoughts are present. **3** There is nothing to support that the client has issues with self-image. This would not be a priority at this time. **4** Talking about the situation helps the individual to put the crisis in perspective. **5** This will not help the client cope with the loss and may add to the client's anxiety.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**54. Answer: 1, 5.**

**1** The nurse should assume an active role in assessing the current situation and facilitate the interview with authority. **2** This is not appropriate; the client usually needs direction to move forward. **3** This approach might be more appropriate for long-term therapy. **4** This is an analytical approach that is not appropriate for crisis intervention. **5** During crisis intervention the nurse should be goal-directed to assist the client with coping with the crisis.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**55. 4 This assessment assists the nurse to determine what the situation means to the client.**

**1, 2, 3** This is not the priority but should be included in a later assessment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**56. 2 Clients in crisis need assistance with coping; the nurse must be involved with problem solving.**

**1, 3, 4** Although a positive interview statement, this does not focus on the nurse's involvement with problem solving.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring, Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**57. Answer: 2, 1, 5, 4, 3.**

**2** The sooner a client who has experienced a crisis receives professional intervention, the sooner the individual can be helped to cope effectively. **1** Clients must then be stabilized to ensure that order has been reestablished to their physical and emotional status. **5** Understanding the event helps the individual to move from shock and disbelief to the next stage of coping. **4** Using resources helps the individual to move toward resolution of the crisis. **3** Eventually the client can move toward self-reliance.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**58. 1 Developmental level is essential to understanding a child's response to a crisis situation; the variety of coping abilities usually increases as the child progresses through the stages of growth and development.**

**2, 4** Although this is important and eventually should be done, it is not an initial assessment. **3** This should be assessed after the child's developmental level is identified.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 16, Crisis Intervention, Nursing Care

**59. 2 Before progress can be made in treating anger, clients need to take responsibility**

**for their behavior. As long as they blame others, they will not be motivated to change.**

**1** Clients may express remorse but continue to blame others and not feel the need for change. **3** This is a worthwhile goal, but it is more appropriate later in therapy. It is not an initial goal. **4** These clients need to change their behavior, not teach others to change.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Anger Management, Overview

**60. 3 This is an assertive statement; it clearly states what the problem is and sets limits on undesired behavior without being demeaning.**

**1** This is a nonassertive or passive statement that denies the individual's own needs and desires. **2** This is an aggressive statement that is demeaning and intimidating. **4** This is a passive-aggressive response that avoids direct, honest confrontation for devious manipulation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Assertiveness Training

**61. 2 Nurses who work with clients who are victims of partner abuse need to be supportive and patient. It takes time and several attempts for most victims to be able to leave abusive relationships.**

**1** This may or may not be true. There is not enough information to support this conclusion. **3** The staff can encourage the woman to make plans for addressing various potential events. Information about social services and telephone help lines can be beneficial. **4** The nurse should not resort to shaming women in this position because it will make them less likely to seek help.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Domestic Violence, Nursing Care

**62. 4 This is important because side effects and denial of illness may cause clients to stop taking their medications; this is a common cause of relapse.**

**1** Although this is beneficial, this may not always be possible to achieve. **2** It is impossible to create a stress-free environment; clients need to learn better ways to cope with stress. **3** Refraining from any activity that may cause anxiety is too restrictive.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Overview

**63. 2 It takes 2 to 4 weeks for the drug to reach a therapeutic blood level.**

**1, 4** This is too short a time for a therapeutic blood level of the drug to be achieved. **3** Improvement in depression should be demonstrated earlier than this.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antidepressants

**64. 1 Occipital headaches are the beginning of a hypertensive crisis that results from**

**excessive tyramine.**

**2** This is unrelated to the ingestion of tyramine. **3** These are unrelated to the ingestion of tyramine. **4** Excessive tyramine causes an increase, not a decrease, in blood pressure.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antidepressants

**65. 3 Lithium alters sodium transport in nerve and muscle cells and causes a shift toward intraneuronal metabolism of catecholamines. Since the range between therapeutic and toxic levels is very small, the client's serum lithium level should be monitored closely.**

**1** Sodium restriction may cause electrolyte imbalance and lithium toxicity. **2** This is not necessary or useful. **4** This may or may not be necessary; it depends on what the client is receiving. Also, it requires a health care provider's order.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antimanic and Mood-Stabilizing Agents

**66. 4 The lithium level should be maintained between 0.5 and 1.5 mEq/L.**

**1, 3** This is unsafe. **2** The lithium level is currently unsafe, but it does not need to drop to 0.5 mEq/L before being resumed.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antimanic and Mood-Stabilizing Agents

**67. 4 Unintentional tremors are one of the extrapyramidal side effects of the antipsychotics and are considered common and manageable.**

**1** This is a severe but not a common occurrence; periodic liver function tests should be performed. **2** An excessive number of melanocytes is not a side effect of antipsychotics. **3** This is not a common side effect.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antipsychotic Agents

**68. 2 Flumazenil (Romazicon) is the drug of choice in the management of overdose when a benzodiazepine is the only agent ingested by a client not at risk for seizure activity. This medication competitively inhibits activity at benzodiazepine recognition sites on GABA/benzodiazepine receptor complexes.**

**1** Lithium is used in the treatment of mood disorders. **3** Methadone is used for narcotic addiction withdrawal. **4** Chlorpromazine is contraindicated in the presence of central nervous system depressants.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16,

Related Pharmacology: Psychotropic Medications, Antianxiety/Anxiolytic Medications

**69. 2 This is a serious side effect that may occur with abrupt withdrawal from barbiturates.**

**1, 3, 4** This is not associated with barbiturate withdrawal.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Sedative and Hypnotic Agents

**70. 2 Clients in acute withdrawal from alcohol should be medicated based on withdrawal symptoms, not medication dosage. The use of the CIWA for alcohol scale promotes assessment and evaluation of the client experiencing withdrawal.**

**1** Clients withdrawing from alcohol can tolerate abnormally high doses of chlordiazepoxide (Librium) and should be medicated based on withdrawal symptoms, not medication dosage. **3** There is no reason to switch to another medication because the client can tolerate higher doses of chlordiazepoxide based on the fact that withdrawal symptoms are still being displayed. **4** This is unnecessary because the client can tolerate higher doses of Librium because withdrawal symptoms are still being displayed.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antianxiety/Anxiolytic Medications

**71. Answer: 3, 5.**

**1** This is a type I (positive) symptom. **2** This is a type I (positive) symptom. **3** Apathy is a common type II (negative) symptom; flat affect and lack of socialization also are common. **4** This is a type I (positive) symptom. **5** Disinterest in performing daily self-care activities is a common type II (negative) symptom.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**72. 4 This medication can be given IM every 2 to 3 weeks for clients who are unreliable in taking oral medications; it allows them to live in the community while keeping the disorder under control.**

**1** Lithium is a mood stabilizing medication that is given to clients with bipolar disorder. This drug is not given for schizophrenia. **2** Diazepam (Valium) is an antianxiety/anticonvulsant/skeletal muscle relaxant that is not given for schizophrenia. **3** Fluvoxamine (Luvox) is a selective serotonin reuptake inhibitor (SSRI); it is administered for depression, not schizophrenia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**73. 4 The use of these drugs can raise the seizure threshold, which is counterproductive.**

**1** A tyramine-free diet is required with MAOI therapy, not after electroconvulsive therapy. **2** Photosensitivity is not a side effect of electroconvulsive therapy. **3** A stable sodium level is necessary with lithium, not electroconvulsive, therapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antianxiety/Anxiolytic Medications

**74. 4 The development of glaucoma is one of the side effects of imipramine (Tofranil), and the client should be taught the symptoms.**

- 1, 2** This is true of monoamine oxidase inhibitors (MAOIs). Imipramine is not an MAOI. **3** Tolerance is not an issue with tricyclic antidepressants such as imipramine.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antidepressants
- 75. 2 Haloperidol (Haldol) causes photosensitivity. Severe sunburn can occur on exposure to the sun.**
- 1** There is no known side effect that affects night driving. **3** This would be true if the client were taking an MAO inhibitor. However, people taking psychotropic medications should avoid alcohol. **4** Aspirin is not contraindicated.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents
- 76. 4 Valproic acid (Depakene) must reach a therapeutic level to be effective, and the serum level must be monitored for therapeutic and toxic levels of the drug.**
- 1, 2, 3** The serum drug levels are not monitored with this medication.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antimanic and Mood-Stabilizing Agents
- 77. 3 This drug does not produce an immediate effect; nursing measures must be continued to decrease the risk for suicide.**
- 1** This precaution is not necessary. **2** These food precautions are taken with the MAO inhibitors. **4** This is not necessary with fluoxetine (Prozac).  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antianxiety/Anxiolytic Medications
- 78. 3 Haloperidol (Haldol) alters the effectiveness of exogenous insulin, and the combination of haloperidol and insulin must be used with caution.**
- 1** The occurrence of respiratory depression is more likely with a combination of antipsychotics and barbiturates. **2** This would be more likely to occur if the antipsychotic were fluoxetine (Prozac). **4** There are no data to support this statement.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;  
**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents
- 79. 3 These medications are used to control the extrapyramidal (parkinsonism-like) symptoms that often develop as a side effect of antipsychotic therapy.**
- 1** There is no documented use of these drugs with antianxiety agents because they do not have extrapyramidal side effects. **2** Barbiturates do not have extrapyramidal side effects that respond to these drugs. **4** Antiparkinsonian drugs usually are not prescribed in conjunction with antidepressants because antidepressants do not cause parkinsonism-like symptoms.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**80. 3 Clozapine (Clozaril) may cause agranulocytosis, which can result in acquiring an infection.**

**1** Risk for falls is more common with typical antipsychotic medications because they may cause orthostatic hypotension and extrapyramidal side effects. **2** An inability to sit still (akathisia) is more common with typical antipsychotics because they may cause extrapyramidal side effects. **4** Dizziness upon standing (orthostatic hypotension) is more common with typical antipsychotics because they may cause extrapyramidal side effects.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**81. 4 Clients taking chlorproMAZINE should be instructed to stay out of the sun. Photosensitivity makes the skin more susceptible to burning.**

**1, 2, 3** Photosensitivity is not a side effect of this medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**82. 1 Liver damage is a well-documented toxic side effect of antipsychotics. By continuing to administer the drug, the nurse failed to use professional knowledge in the performance of responsibilities as outlined in the Nurse Practice Act.**

**2** Blood levels must be reduced when signs of liver damage are present. **3** Liver damage, indicated by jaundice, is a well-documented side effect. **4** The antipsychotic should be stopped, not reduced; liver damage is a well-documented toxic side effect.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**83. Answer: 1, 6.**

**1** Acute dystonic reactions, such as tremors, dyskinesia, and akathisia, are observable side effects of fluphenazine therapy. **2** There is a decrease, not an increase, in salivation. **3** Rambling speech is not a side effect of fluphenazine therapy. **4** Reluctance to converse is not a side effect of fluphenazine therapy. **5** Minimal use of nonverbal expression is not a side effect of fluphenazine therapy. **6** Acute dystonic reactions, including uncoordinated movement of extremities, are observable side effects of fluphenazine therapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**84. 3 This occurs as a late and persistent extrapyramidal complication of long-term antipsychotic therapy. It is most often manifested by abnormal movements of the lips,**

**tongue, and mouth.**

**1, 2, 4** This is reversible with administration of an anticholinergic (e.g., benztropine [Cogentin]) or an antihistamine (e.g., diphenhydramine [Benadryl]) or by stopping the medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antipsychotic Agents

**85. 1 The monoamine oxidase inhibitors can cause a hypertensive crisis if food or beverages that are high in tyramine are ingested.**

**2** This is important for clients taking one of the phenothiazines. **3** This is not contraindicated. **4** Antihistamines are not prohibited with MAOI medications.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antidepressants

**86. 1 It usually takes 1 to 4 weeks to attain a therapeutic blood level of this monoamine oxidase inhibitor (MAOI).**

**2, 3** This medication works within 1 to 4 weeks. **4** The client needs a longer time to see an effect from this medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antidepressants

**87. 1 Mydriatic action causes dilated pupils, which can precipitate an acute attack of glaucoma, resulting in blindness.**

**2, 3, 4** Although this is a side effect, it is not serious and can be resolved.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antidepressants

**88. 2 Ziprasidone (Geodon) is a neuroleptic, which will reduce psychosis by affecting the action of both dopamine and serotonin.**

**1** Citalopram (Celexa) is a selective serotonin reuptake inhibitor (SSRI)

antidepressant. **3** Benztropine (Cogentin) is an anticholinergic. **4** Acetaminophen with hydrocodone (Lortab) is an analgesic/opioid.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antipsychotic Agents

**89. 3 Olanzapine (Zyprexa, Zydis) is an oral disintegrating tablet, which will instantly dissolve on contact with moisture.**

**1** This medication can be given only orally. **2** Tyramine-free diets are necessary with MAOIs, not antipsychotics. **4** This is not necessary with this medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology:

Psychotropic Medications, Antipsychotic Agents

**90. Answer: 1, 2, 5.**

**1, 2, 5** This response may occur because of the effect of the antipsychotic on the postsynaptic dopamine receptors in the brain. **3, 4** This is a side effect of anticholinergic, not antipsychotic, drugs.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**91. 3 This is the advised intervention when a dose is missed; interruption of the medication may precipitate signs of withdrawal such as anxiety and tachycardia.**

**1** This provides an excessive amount of the medication at one time. **2** This is unnecessary. **4** Skipping a dose is not advised unless taking it is too close to the next regularly scheduled dose.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**92. 1 Olanzapine (Zyprexa), a thienobenzodiazepine, can cause orthostatic hypotension.**

**2** Blurred, not double, vision may occur. **3** An anticholinergic effect of olanzapine is decreased salivation. **4** Olanzapine may cause nausea and other GI upsets; it should be taken with fluid or food.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**93. Answer: 2, 3, 4.**

**1, 5** This is not associated with neuroleptic malignant syndrome. **2, 3, 4** This occurs with neuroleptic malignant syndrome as a result of dopamine blockade in the hypothalamus.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**94. Answer: 1, 3.**

**1** Weight gain is a common side effect of olanzapine. **2** Olanzapine (Zyprexa) has no significant effect on blood clotting time. **3** Olanzapine, being an atypical antipsychotic, affects the negative symptoms of schizophrenia, one of which is lack of pleasure (anhedonia). **4** Olanzapine, being an atypical antipsychotic, has a decreased chance of extra pyramidal side effects. **5** Olanzapine, being an atypical antipsychotic, has a significantly reduced chance of akathisia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antipsychotic Agents

**95. Answer: 1, 2.**

**1** Since stimulants act by increasing both adrenalin and dopamine, seizures can occur. Diazepam (Valium) can decrease the chance of seizures. **2** Since amphetamines act by increasing adrenalin, which can stimulate the heart, propranolol (Inderal), a beta blocker, will decrease this adrenergic stimulation. **3** Benztropine (Cogentin), a cholinergic blocker, is not indicated as a treatment for stimulant intoxication. **4** BuPROPion (Wellbutrin) is contraindicated because it increases dopamine and adrenalin, which will exacerbate stimulant intoxication. **5** Amitriptyline is contraindicated because it increases dopamine and adrenalin, which will exacerbate stimulant intoxication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 16, Related Pharmacology: Psychotropic Medications, Antianxiety/Anxiolytic Medications

**96. 3 When paroxetine (Paxil) and galantamine (Razadyne) are taken together, they potentiate the action of each other.**

**1** Giving these medications concurrently will not precipitate an allergic reaction. **2** Dystonic effects are associated with antipsychotic medications. **4** Extrapyramidal effects occur with antipsychotic medications.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 16, Anti-Alzheimer Agents

# **Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence**

**97. 1 It is the most effective method for the child to play out feelings; when feelings are allowed to surface, the child can then learn to face them by controlling, accepting, or abandoning them.**

**2, 3, 4** This is not child-specific and generally is more suited for adolescents, young adults, and adults.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**98. Answer: 3, 5.**

**1** Impairments in communication and imaginative activity result in a failure to imitate others. **2** Children with autism are indifferent to or have an aversion to affection and physical contact. **3** Impairments in social interaction are manifested by a lack of eye contact, a lack of facial responses, and a lack of responsiveness to and interest in others. **4** Impairments in social interaction and imaginative activity are manifested by failure to engage in cooperative or imaginative play with others. **5** Children with autism display obsessive ritualistic behaviors, such as rocking, spinning, dipping, swaying, walking on toes, head banging, or hand biting, because of their self-absorption and need to stimulate themselves. **6** Children with autism are unable to establish meaningful relationships with adults or children because of their lack of responsiveness to others.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**99. 3 Secondary reinforcers involve the use of social approval; behaviors such as a hug meet this requirement.**

**1, 2** Food is a primary reinforcer and should not be associated with behavior modification. **4** The child may not be capable of selecting an appropriate secondary reinforcer.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**100. 3 Infants and toddlers 6 to 30 months of age experience separation anxiety; it is this age group's major stressor and is most traumatic to the child and parent.**

**1** Adolescents are often ambivalent about whether they want their parents with them when hospitalized. Peer group separation may pose more anxiety for the adolescent. **2** The school-age child is more accustomed to periods of separation from parents. **4** Separation anxiety occurs in this age group, but it is less obvious and less

serious than in the toddler.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Anxiety Disorders of Infancy, Childhood, and Adolescence, Data Base

**101. 2 Autism impairs bonding and communication and therefore becomes apparent early in life.**

1 Autism has both delayed and deviant linguistic problems. 3 About 25% of children with autism have a seizure disorder. 4 Autism may, and often does, include mental retardation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**102. 4 Research studies have shown that the prognosis for normal productive functioning in autistic people is guarded, particularly if there are delays in language development.**

1 Accurate diagnosis and early interventions have not been shown to promote a normal productive life; however, early interventions may help individuals to maximize their abilities. 2 While temperament may affect the child's response to treatment, it does not affect prognosis to any extent. 3 This is false reassurance and is not helpful.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**103. 3 Poor interpersonal relationships, inappropriate behavior, and learning disabilities prevent these children from emotionally adapting or responding to the environment despite a possible high level of intelligence.**

1 It is the lack of response to stimuli that is the clue to the possibility that the child may have autism. 2 They have an aversion to physical contact. 4 They have impaired interpersonal relationships regardless of the age of the other person.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**104. 1 By 2 years of age the child should demonstrate an interest in others, communicate verbally, and possess the ability to learn from the environment. Before these skills develop, autism is difficult to diagnose. Usually by 3 years the signs of autism become more profound.**

2 Autism can be diagnosed long before this age. 3, 4 Infantile autism can occur at this age but is difficult to diagnose.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**105. 1 Children with autism usually have a pervasive impairment in reciprocal social interaction. Lack of eye contact is a typical behavior associated with autism.**

2, 3, 4 This is not indicative of a child with autism.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**106. 2 Entering the child's world in a nonthreatening way helps to promote trust and eventual interaction with the nurse.**

**1, 3** This is unrealistic at this time; this is a long-term objective. **4** This may be necessary when the child initiates self-mutilating behaviors.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**107. 3 The priority is safety; the child must be protected from self-harm.**

**1** Repetitive behaviors are comforting, and unless they are harmful, their limitation is not a priority. **2** Although this is a basic need that may be attained, it is not the priority. **4** Children who need help with toileting are not necessarily incontinent; in addition, this is not the priority.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, Pervasive Developmental Disorders, Nursing Care

**108. 4 Autistic behavior turns inward. These children do not respond to the environment but attempt to maintain emotional equilibrium by rubbing and manipulating themselves and displaying a compulsive need for behavioral repetition.**

**1** These children do seem to respond to music, but not necessarily loud, cheerful music. **2** Large-group (or small-group) activity has little effect on the autistic child's response. **3** Part of the autistic pattern is the inability to interact with others in the environment, regardless of the size of the group.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Pervasive Developmental Disorders, Data Base

**109. 1 A universal characteristic of these children is distractibility. They are highly reactive to any extraneous stimuli, such as noise and movement, and are unable to inhibit their responses to such stimuli.**

**2** Rituals are uncommon, although they do use repetition in language or movement. **3** Delayed development of language skills is not the major problem, but children with attention deficit disorder may exhibit dyslexia (reading difficulty), dysgrammatism (speaking difficulty), dysgraphia (writing difficulty), or delayed talking. **4** Loss of abstract thought is not a universal characteristic associated with children with attention deficit disorder.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Attention Deficit Hyperactivity Disorder, Data Base

**110. 3 Methylphenidate (Ritalin) appears to act by stimulating release of norepinephrine from nerve endings in the brainstem.**

**1** Lorazepam (Ativan) is a benzodiazepine used to treat anxiety and

insomnia. **2** Haloperidol (Haldol) is an antipsychotic medication. **4** Methocarbamol (Robaxin) is a muscle relaxant.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 17, General Nursing Care of Children with Disorders First Evident in Infancy, Childhood, or Adolescence

**111. 3 Focusing on specifics is important for children who are easily distracted.**

**1** Focusing on more than one item at a time might be difficult for an easily distracted child. **2** Hyperactive children respond best to concrete tasks; this is not a concrete task. **4** A child who is easily distracted has difficulty talking to a group of children regarding a particular topic.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**112. Answer: 1, 2, 5, 6.**

**1** Impulsivity, the inability to limit or control words or actions, results in spontaneous, irresponsible verbalizations or behaviors. **2** Hyperactivity occurs with both words and actions. **3** This is associated with oppositional defiant disorder and is reflective of negativistic, hostile, defiant behavior toward others. **4** This is associated with oppositional defiant disorder and is reflective of insubordinate, hostile behavior toward authority; children with attention deficit hyperactivity can be annoying, but the behavior is not deliberate. **5** Games that are fun, engaging, and interactive often maintain the focus of children with attention deficit hyperactivity disorder. **6** Inattention and distractibility result in an inability to focus long enough to complete tasks.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 17, Attention Deficit Hyperactivity Disorder, Data Base

**113. 2 The longer these children stay out, the more difficult it is to get them to return to school because more fantasies and fears develop.**

**1** This will feed into the child's fear that the phobia is realistic. **3** This approach is not effective. **4** This will increase, not decrease, the child's fear.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**114. 1 School phobia is a disorder that cannot legally be ignored for long because children must attend school. It requires intervention to alleviate the separation anxiety and/or to promote the child's increasing independence.**

**2, 3, 4** This clinical manifestation requires the parents to comfort, to reorient to reality, and to help the child regain self-control. Legally there are no requirements mandating treatment for this common childhood problem.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Anxiety Disorders of Infancy, Childhood, and Adolescence; Data Base

**115. 1 This response acknowledges the parent's distress and encourages a verbalization of feelings.**

**2** This response is insensitive to the parent's feelings; it may be more appropriate later when the parent's stress has diminished. **3** Although this may be true, this response is confrontational and may close off communication. **4** This response is insensitive to the parent's feelings; it may be more appropriate later if medication is prescribed and health teaching is started.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**116. 3 This disorder interferes with the ability to perceive and respond to sensory stimuli, which causes a deficit in interpreting new sensory data. This makes learning difficult and results in learning disabilities.**

**1, 4** This is not necessarily true. **2** This is not true; there is no mental retardation present.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Attention Deficit Hyperactivity Disorder, Data Base

**117. 2 Methylphenidate (Ritalin) is an appetite suppressant; it should be given after meals.**

**1, 3, 4** Methylphenidate at this time may suppress the child's appetite.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, and Adolescence

**118. 2 External rewards can motivate as well as increase self-esteem.**

**1** This is unnecessary because children with attention deficit hyperactivity disorder are alert and oriented. **3** Feelings of frustration should not be suppressed, but rather the child should learn how to cope with these feelings in an acceptable manner. **4** The use of restraints is contraindicated because they are restrictive and punitive.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care of Clients with Disorders First Evident in Infancy, Childhood, or Adolescence

**119. 2 Oppositional defiant disorder is a repeated pattern of negativistic, disobedient, hostile, defiant behavior toward authority figures usually exhibited before 8 years of age.**

**1** This is associated with attention deficit hyperactivity disorder and reflects an inability to sustain focus on a task. **3** This is associated with conduct disorder and reflects a violation of a societal norm. **4** This is associated with conduct disorder and reflects a

violation of the rights of another.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Unspecified Conduct Disorder/Oppositional Defiant Disorder, Data Base

**120. 1 Clients with conduct disorder are at risk for physically, emotionally, or sexually harming themselves or others; safety of the client and others is the priority.**

**2** Although this is important, it is not the priority; these children have difficulty being insightful. **3, 4** Although this is important, it is not the priority.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, Unspecified Conduct Disorder/Oppositional Defiant Disorder, Nursing Care

**121. 2 Children who exhibit behaviors associated with conduct disorder before the age of 10, rather than during adolescence, have a higher incidence of developing antisocial personality disorder during adolescence.**

**1** If an oppositional defiant disorder persists for at least 6 months, it may be a precursor of a conduct disorder. **3** Pervasive developmental disorders are characterized by impairments in reciprocal social interaction and communication skills; types include autistic, Asperger, Rett, and childhood disintegrative disorders; they are not preceded by conduct disorder. **4** Attention deficit hyperactivity disorder is often dually diagnosed with oppositional defiant disorder or conduct disorder and may precede the development of Tourette syndrome.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 17, Unspecified Conduct Disorder/Oppositional Defiant Disorder, Data Base

**122. Answer: 4, 2, 3, 5, 1.**

**4** Situations that promote inattention, hyperactivity, and impulsivity should be avoided. **2** By monitoring behavior for rising anxiety, the child can then be cued to the behavior or the environmental stimuli can be limited. **3** When cues of increasing frustration are noted, the child should be sent a predetermined word, gesture, or eye contact as a reminder to maintain control. **5** When the child is unable to initiate self-control, a simple, concrete directive may interrupt and redirect the unacceptable behavior. **1** Strategic removal, such as a time-out, should be used as a last resort because it may make the child a scapegoat.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 17, General Nursing Care Related to Disorders First Evident in Infancy, Childhood, or Adolescence

**123. 3 This outcome is specific for children with a risk for violence directed at others; children with the diagnosis of conduct disorder typically present with a repetitive and persistent pattern of behavior that violates the basic rights of others or major age-appropriate societal norms or rules.**

**1** This is a short-term goal for children with a variety of mental disorders of childhood such as attention deficit hyperactivity disorder and oppositional defiant disorder. **2** This is a short-term goal for children who have disturbed self-

esteem. **4** This is a short-term goal for children who have impaired social interaction.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**  
Evaluation/Outcomes; **Reference:** Ch 17, Unspecified Conduct Disorder/Oppositional  
Defiant Disorder, Data Base

# Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

- 124. 3 This technique tests the client's ability to recall from short-term memory.**  
**1** This part of the exam tests the ability to calculate and pay attention. **2** This part of the exam tests visual comprehension. **4** This part of the exam tests verbal skills for aphasia.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Dementia, Nursing Care
- 125. 4 When an older person's brain atrophies, some unusual deposits of iron are scattered on nerve cells. Throughout the brain, areas of deeply staining amyloid, called senile plaques, can be found; these plaques are end stages in the destruction of brain tissue.**  
**1** It is associated with a chronic deterioration, not with remissions and exacerbations. **2** This may or may not be part of the disorder. **3** This is typical of vascular dementia, not dementia of the Alzheimer type.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Data Base
- 126. 1 The client must be kept from harming self or others; the client needs a calm, supportive environment that meets needs and maintains dignity.**  
**2** Alzheimer dementia is characterized by progressive deterioration that is not preventable; however, some drugs such as donepezil (Aricept) may slow mild to moderate dementia. **3** Although addressing the needs of family members is important, the focus of care primarily is on the client. **4** This may be unrealistic and is not the priority.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care
- 127. 4 Clients with this disorder need a simple environment. Because of brain cell destruction, they are unable to make choices.**  
**1** A well-balanced diet is important throughout life, not just during senescence; a diet high in carbohydrates and protein may be lacking other nutrients such as fats. **2** The client may be incapable of making choices; providing alternative choices will increase anxiety. **3** Emotional needs must be met on a continuous basis, not just at fixed times.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care
- 128. 3 These clients attempt to use defense mechanisms that have worked in the past but use them in an exaggerated manner. Because of brain cell destruction, they are unable to develop new defense mechanisms.**  
**1** Clients with dementia will depend on old, familiar defense mechanisms. **2** The client is not capable of focusing on one defense mechanism. **4** The client is incapable of developing new defense mechanisms at this time.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Dementia, Nursing Care

**129. 2 Damaged brain cells do not regenerate. Care is therefore directed toward preventing further damage and providing protection and support.**

**1** The deterioration of the brain cells makes plans for a reeducation program unrealistic. **3** A client with this disorder may not be able to grasp, understand, or enjoy new leisure activities. **4** It is beyond the scope of the client's ability to function in a group therapy session.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

**130. Answer: 1, 4, 6.**

**1** Delirium, a transient cognitive disorder caused by global dysfunction in cerebral metabolism, causes sparse or rapid speech that may be slurred and incoherent. **2** Clients with delirium consistently are irritable, anxious, and fearful; lability of mood is associated with dementia. **3** Short-term memory loss is associated with both delirium and dementia; eventually, long-term memory loss is associated with dementia. **4** Visual or tactile hallucinations and illusions may occur with delirium because of altered cerebral functioning; hallucinations are not prominent with dementia. **5** The onset of delirium is abrupt (hours to days) and has an organic basis; it is often precipitated by drugs such as anesthesia, analgesics, and antibiotics or by conditions such as infections, end-stage kidney disease, and substance abuse or withdrawal; the onset of dementia is slow and insidious (years). **6** Clients with delirium fluctuate from hyperalert to difficult to arouse; they may lose orientation to time and place; clients with dementia do not have fluctuating levels of consciousness, but they may be confused and disoriented.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Delirium, Data Base

**131. 2 An illusion is a misperception or misinterpretation of an actual external stimulus.**

**1** This is a false belief that cannot be changed even by evidence; it is associated with psychoses. **3** This results from an imaginary, not real, stimulus. **4** An idea of reference is a belief that others are talking about the person.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Delirium, Data Base

**132. 3 A one-to-one trusting relationship is essential to help the client become more involved and interested in interpersonal relationships.**

**1** Privacy usually is not an issue for a confused client who requires increased supervision. **2** A confused individual needs to start with a one-to-one relationship before progressing to group involvement. **4** Selected activities, rather than a large variety of activities, are best.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

**133. 3 Clients who are out of control are seeking control and frequently respond to**

**simple directions stated in a firm voice.**

**1** "Be quiet" is an order that is nontherapeutic; furthermore, this is demeaning to the client. **2** This will not help the client gain control and might be frightening to other clients in the day room. **4** This is done only after an attempt at calming the client has failed.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

**134. Answer: 1, 2, 4, 5.**

**1** Resistance to change is a clinical finding associated with dementia; these client need structure and routines. **2** An inability to recognize familiar objects (agnosia) is a typical cognitive dysfunction associated with dementia. **3** Clients with delirium, dementia, or other cognitive disorders rarely express any concern about personal appearance. The staff must meet most of these clients' personal needs. **4** A short attention span and little or no interest in new activities are typical of dementia. **5** The past is where these clients feel more comfortable rather than the threatening present.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Dementia, Data Base

**135. 2 This is a true statement; clients become progressively worse over time.**

**1** Alzheimer disease usually appears in people 60 years of age and older. **3** Alzheimer disease is an organic, not a functional, disorder. **4** At this time there are no diagnostic tools other than autopsy that can provide a definite confirmation of Alzheimer disease.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Data Base

**136. Answer: 1, 2, 4.**

**1** Monitoring weight is an objective way to assess nutritional status. **2** Specialized equipment can facilitate the client's participation in self-care. **3** The client needs to wear clothes to help maintain a positive view of self. **4** Incorporating rest periods into the client day prevents fatigue and energizes the client for the next period of activity. **5** It is not appropriate to review budgeting and use of community resources with a client in the early dementia stage of Alzheimer disease; these activities may produce frustration, withdrawal, and/or self-absorption. **6** A client with early dementia stage of Alzheimer disease usually is unable to participate in or travel with a local senior citizens group.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

**137. 4 A consistent approach and consistent communication from all members of the health team help the client who has dementia remain more reality-oriented.**

**1** It is the staff members who need to be consistent. **2** Clients who have this disorder do not attempt to manipulate the staff. **3** This is not needed when working with clients who have this disorder; consistency is most important.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

138. **Answer: 1, 3, 4, 5.**

**1** The behavior of clients with dementia tends to be inappropriate, restless, and agitated. **2** Pessimism is more characteristic of depression, not dementia. The two often occur together and should be identified and treated appropriately. **3** Cognitive abilities are impaired, evidenced by a short attention span, limited ability to focus, and limited judgment and insight. **4** Cognitive abilities are impaired, evidenced by disordered reasoning; speech may be incoherent; memory, particularly short-term memory, is impaired. **5** Impaired motor activity (apraxia) and impaired coordination (ataxia) are associated with dementia.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Dementia, Data Base

139. **4 The therapeutic milieu is directed toward helping the client develop effective ways of functioning safely and independently.**

**1** This is one small part of the overall objectives. **2** The therapeutic milieu allows some items from home to make the client less anxious; however, the objective is not to duplicate a home situation. **3** This is a worthwhile objective but not as important as maximizing safe, independent functioning.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

140. **1 Reality orientation generally is helpful to clients exhibiting mild cognitive impairment; these clients are aware of their impairment, and orientation then reduces anxiety.**

**2** Behavioral confrontation is not therapeutic because it may cause frustration and increase psychomotor agitation in a client with cognitive impairment. **3** Reflective communication is a technique in which the nurse restates or repeats the client's statements; it can be used to clarify thoughts but can also lead to frustration when the approach is overdone. **4** Reminiscence group therapy is helpful with severely confused, disorganized clients because it reinforces identity, acknowledges what was significant, and often compensates for the dullness of the present.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Dementia, Nursing Care

141. **1 Neurofibrillary tangles in the hippocampus cause recent memory loss (amnesia); temporoparietal deterioration causes cognitive deficiencies in speech (aphasia), purposeful movements (apraxia), and comprehension of visual, auditory, and other sensations (agnosia).**

**2** These characteristics are related to schizoid personality. **3** These characteristics are related to schizophrenia. **4** These characteristics are related to antisocial personality.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Dementia, Data Base

142. **3 Orientation to place refers to an individual's awareness of the objective world in its relation to the self; orientation to time, place, and person is part of the assessment of cerebral functioning.**

**1** This requires abstract thinking, which involves a higher integrative function than orientation to place. **2** This assesses remote memory, not orientation. **4** This assesses recent memory, not orientation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Dementia, Nursing Care

**143. 4 The first step in a plan of care should be the establishment of a meaningful relationship because it is through this relationship that the client can be helped.**

**1** This client is not getting out of bed; rest periods are not needed. **2** The client has already reduced environmental stimuli by staying in bed. Further reduction is not needed. **3** Establishing social relationships is a long-term goal.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**144. Answer: 3, 4, 1, 2, 5.**

**3** The nurse should first identify the client's feelings. **4** After identifying the client's feelings, the nurse should then simply explain why the voices occur. **1** The nurse should then point out reality. **2** The nurse should attempt to distract the client from the hallucination by engaging in a one-to-one activity. Also, walking will discharge energy. **5** Eventually the client may engage in a small group activity that may distract her from the hallucination.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**145. 1 Clients can sometimes learn to push auditory hallucinations aside, particularly within the framework of a trusting relationship; it may provide the client with a sense of power to manage the voices.**

**2** Once it has been established that the voices are not issuing commands to harm self or others, focusing on the content of the hallucinations is not therapeutic. **3, 4** This is irrelevant; clients believe and are frightened by hallucinations.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**146. 4 Delusions are protective and can be abandoned only when the individual feels secure and adequate. This response is the only one directed at building the client's security and reducing anxiety.**

**1** This is almost impossible. **2** Clients cannot be argued out of a delusion. **3** The client is unable to explain the reason for the feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Delusional (Paranoid) Disorders, Nursing Care

**147. 1 This response recognizes the client's feelings and provides assurance that the staff member will be present.**

**2** Locking the client in a room will only increase the fear and delusion. **3** The client does

not know this; if the client did, delusions would not be present. **4** The client is not ready to accept this and really believes danger is imminent.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Delusional (Paranoid) Disorders, Nursing Care

**148. 1 Clients cannot be argued out of delusions, so the best approach is a simple statement of reality.**

**2** This is a form of entering into the client's delusions; the client may feel that only a particular part was free of poison. **3** This is trying to argue the client out of the delusion. It will not work. The client can make up a reason ("They have the antidote") to continue in the false belief. **4** Threats are always inappropriate nursing interventions.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Delusional (Paranoid) Disorders, Nursing Care

**149. 4 These are positive symptoms associated with schizophrenia; positive symptoms reflect a distortion or excess of normal functions.**

**1, 2** These are negative symptoms associated with schizophrenia; negative symptoms reflect a lessening or absence of normal functions. **3** These symptoms are associated with bipolar disorder, manic episode.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Schizophrenic Disorders, Data Base

**150. 1 The initial intervention should be to demonstrate acceptance and work toward developing trust.**

**2** This will increase the anxiety of a psychotic client; it is a correct action in the working phase of the nurse-client relationship. **3** This delays the initial stage of the nurse-client relationship. **4** This will increase anxiety; it is an acceptable action in the ongoing working, not initial, phase of a therapeutic relationship.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**151. 1 This message is concise and does not require decision making; it is less likely to increase anxiety.**

**2** This asks the client to make a decision when a "no" answer is unacceptable. **3** Requiring the client to make a decision when acutely ill may increase anxiety; also, this permits the unacceptable answer of "never." **4** This is somewhat accusatory; it may increase anxiety by placing responsibility on the client.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**152. 3 This response demonstrates an understanding of the client's feelings and encourages the client to share feelings, which is an immediate need.**

**1** This probably will increase the client's fears. **2** This is judgmental and demeaning to

the client. **4** Although this statement points out reality, it gives a command that is unrealistic and closes the communication process.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**153. 2 Clients losing control feel frightened and threatened. They need external controls and a reduction in external stimuli.**

**1** This is helpful for pent-up aggressive behavior but not for agitation associated with delusions. **3** The client is unable, at this time, to sit in one place; the client's agitation is building. **4** The client may get completely out of control if allowed to continue pacing.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**154. 1 A firm approach prevents anxiety transference and provides structure and control for a client who is out of control.**

**2** A passive approach for a client who may be out of control does not provide structure, which may increase the client's anxiety. **3** Although the nurse should always base a therapeutic response on empathy, an obviously empathetic response may indicate to the client that the behavior is acceptable. **4** A confrontational approach in this situation may escalate the client's agitation and precipitate further acting out.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**155. 2 The client's behavior is escalating and unsafe. The client should be removed from the room and taken to a place where there is decreased environmental stimulation and less chance for the client to act out against others.**

**1** This response accepts the physical abuse, which should never be done. **3** The behavior and the client should never be ignored; the client needs limits set on behavior immediately. **4** When a client is acting out, the nurse must intervene to stop the behavior. Discussing the client's feelings can come later when the client is exhibiting more control.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**156. 2 Clients acutely ill with schizophrenia frequently do not trust others; feeling trapped may be frightening, causing them to lash out.**

**1** There is no indication that voices are speaking to the client in this instance. **3** Clients acutely ill with schizophrenia usually are more concerned with what is happening to them and are not able to be concerned about others. **4** Although this may be true, it is not the primary motivation for this behavior.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Schizophrenic Disorders, Data Base

**157. 2 This response focuses on a feeling that the client may be experiencing and**

**provides an opportunity to validate the nurse's statement.**

**1** This response demands that the client stay in an uncomfortable situation without offering any support. **3** This response fails to recognize the part anxiety plays in changing behavior. **4** This response seems like an attack on the client; also, although it offers an explanation for the behavior, it fails to convey an understanding that changing behavior is anxiety-producing.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**158. 3 This accepts the client but rejects the behavior. The nurse should set limits on this behavior when it is not performed in a private area.**

**1** This is unrealistic and violates the client's rights. **2** This is a punishment rather than a setting of limits. **4** The client may be too anxious at this time to understand a conversation about acceptable and unacceptable behavior. The nurse has a responsibility to the other clients to limit the behavior.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**159. 1 An interpersonal relationship based on trust must be established before clients can be helped.**

**2** This is an important part of the treatment and care, but it is of lesser importance than a trusting relationship. **3** Socialization comes at a later time in therapy. **4** There is nothing to indicate a need to remove the client from the home.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**160. 1 The nurse, demonstrating knowledge and understanding, accepts the client's perceptions even though they are hallucinatory.**

**2** This may increase the client's guilt and fear. **3** This may increase the client's fear. **4** This presents reality but negates the client's feelings and asks for an unrealistic response.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**161. 4 This response interjects reality and focuses on the client's behavior.**

**1** This response elicits a yes or no answer and does not foster communication. **2** This is a directive response that will be perceived as threatening to a disturbed client experiencing hallucinations. **3** Although this interjects reality, it is not the most therapeutic response because it does not address the client's feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**162. 1 The client needs limits to be set. This response sets limits and rejects the behavior but accepts the client.**

- 2** This does not help raise the client to a functioning level. **3** This serves no useful purpose; inappropriate behavior should be addressed when first noted. **4** This is a punishing action; it shows no support or acceptance of the client.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care
- 163. 4 Command hallucinations are dangerous because they may influence the client to engage in behavior dangerous to self or others.**
- 1** Although profane language may be a cause for concern, it is not as dangerous as command hallucinations. **2** Although excessive touching of others may be a cause for concern, it is not as dangerous as command hallucinations. **3** Although withdrawn behavior may be a cause for concern, it is not as dangerous as command hallucinations.  
**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care
- 164. 1 This lets the client know that the nurse is available. It also demonstrates an acceptance of the client.**
- 2** This is an avoidance technique; it shows a lack of acceptance of the client as a person. **3** Another client's perception of the incident may or may not be valid. **4** Although it is important to document the incident on the client's record, it does not take precedence over letting the client know the nurse is available if needed.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care
- 165. 3 The client is voiding on the floor not to express hostility but because of confusion. Taking the client to the toilet frequently limits voiding in inappropriate places.**
- 1** This is a form of punishment for something the client cannot control. **2** This is not realistic; it will have no effect on the problem and may lead to physiologic problems. **4** If the client were doing this to express hostility, this intervention might be effective, but not when the client is unable to control the behavior.  
**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care
- 166. 2 This response reflects on the client's feelings rather than focusing on the verbalization.**
- 1** This response focuses on the statement rather than on the feeling behind it. **3** This response dismisses the client and the client's feelings. **4** This response puts the client on the defensive and asks for verification that the nurse is indeed a good person; it fails to focus on the feeling behind the statement.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care
- 167. 3 Encouraging the client to focus on the self will facilitate communication and foster**

**self-perception.**

**1** This denies the client's feelings and provides false reassurance. **2** This denies the client's experience. **4** This denies the client's feelings and provides false reassurance.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**168. 1** Assisting clients with grooming keeps them in contact with reality and allows them to realize that staff members care enough to help.

**2** This is not as important as grooming at this time. **3** A one-to-one relationship is best initially. **4** The client may withdraw even more.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**169. 1** Nursing care involves a steady attempt to draw the client into some response. This can best be accomplished by focusing on nonthreatening subjects that do not demand a specific response.

**2** The client is not ready yet to discuss feelings; the first step is to focus on nonthreatening subjects. **3** Questions like these do not encourage communication. **4** By doing this, the nurse is showing acceptance of the client but is doing nothing to encourage communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**170. 1** Keeping the withdrawn client oriented to reality prevents further withdrawal into a private world.

**2** A gradual involvement in selected activities is best. **3** This is futile at this time. **4** The client is unable to tell anyone why this is so.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**171. 2** By observing the client the nurse is better able to understand the client's behavior, which can be an indication of feelings.

**1** It is only one of the many aspects that are part of confirming a diagnosis; this is true in the care of all clients, not just the withdrawn individual. **3** Observation alone is insufficient to make this judgment; however, it allows the staff to individualize the plan of care to suit the client's needs. **4** It is more important to have insight into what the person may be feeling rather than the degree of depression.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

# **Nursing Care of Clients with Disorders Related to Anxiety and Alterations in Mood**

**172. 2 With akathisia the client exhibits a constant state of movement; this is characterized by restlessness and difficulty sitting still, including constant jiggling of the arms and/or legs.**

**1** The distortion of voluntary movements, such as tics, spasms, or myoclonus, is known as dyskinesia. **3** This is a form of catatonia known as waxy flexibility. **4** This is known as echopraxia.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Generalized Anxiety Disorder, Data Base

**173. 4 Recognition of anxiety or symptoms of increasing anxiety is an indication that the client is improving.**

**1, 3** This does not indicate improvement or recognition of feelings; the client may be doing what others expect. **2** Avoidance of anxiety is not a good indication of improvement; there is no guarantee that anxiety can always be avoided.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 19, Generalized Anxiety Disorder, Nursing Care

**174. 2 The client's current behavior is the best indicator of the client's current level of functioning; all behavior has meaning.**

**1, 3, 4** This is important and should be assessed, but it is not the best indicator of the client's current level of functioning.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Generalized Anxiety Disorder, Nursing Care

**175. 1 The client can no longer control or tolerate overwhelming feelings and is seeking help.**

**2** The client has not indicated plans for self-harm. **3** This behavior is not typical of a narcissistic personality. **4** This behavior does not indicate a demanding personality.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Panic Disorder, Data Base

**176. 3 The nurse who is anxious should leave the situation after providing for continuity of care; the client will be aware of the nurse's anxiety, and the nurse's presence will be nonproductive and nontherapeutic.**

**1, 2** This meets the nurse's need; this response may make the client feel guilty that something was said that upset the nurse. The client will be aware of the nurse's anxiety, which will increase the client's own anxiety. **4** The client will probably sense the nurse's anxiety through nonverbal channels, if not through verbal responses.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, General Nursing Care of Clients with Anxiety Disorders

**177. 3 With phobias, the individual transfers anxiety to a safer inanimate object or situation. Therefore, the anxiety and resulting feelings will be precipitated only when in**

**direct contact with the object or situation.**

**1** Phobias are severe anxiety reactions and are not attention-seeking actions. **2** It is not thinking about the feared object that causes anxiety; it is the possibility of having to come into contact with it. **4** It is the presence of the phobic object or situation that triggers the anxiety, not the unfamiliarity of the environment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 19, Phobic Disorders, Data Base

**178. 2 The most successful therapy for clients with phobias involves behavior modification techniques using desensitization.**

**1** Insight into the origin of the phobia usually is not successful in helping clients overcome phobias. **3** This may increase understanding of the phobia but may not help the client to cope with the fear; there is no psychotic thought process associated with phobias. **4** Psychoanalysis may increase understanding of the phobia but may not help the client cope successfully with the overwhelming fear.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 19, Phobic Disorders, Data Base

**179. Answer: 3 tablets. Use the "Desire over Have" formula of ratio and proportion to solve this problem.**

$$\frac{\text{Desire}}{\text{Have}} \frac{1.5 \text{ mg}}{0.5 \text{ mg}} = \frac{x \text{ tablet}}{1 \text{ tablet}}$$

$$0.5 x = 1.5 \text{ tabs}$$

$$x = 1.5 \div 0.5$$

$$x = 3 \text{ tablets}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

**180. 2 Recurrence of attacks is a common concern.**

**1** This statement redirects the focus to the nurse, which is not therapeutic. **3** Although this initially focuses on feelings, it then cuts off communication. **4** The focus should be on the client, not what the family believes.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, Panic Disorder, Data Base

**181. Answer: 2, 4, 5.**

**1** Feelings of guilt may emerge later when the individual moves from focusing on the self to an increased interaction with others. **2** Shock and disbelief are the initial responses to a traumatic experience; a situational crisis usually is unexpected, and its impact causes disequilibrium. **3** Concern for others emerges later after the individual is able to

set aside or resolve own needs. **4** A crisis causes disequilibrium, and the individual experiences confusion, disorganization, and difficulty making decisions. **5** When a person is unable to cope, helplessness and regression often emerge; a crisis occurs when there is a painful, frightening event that is so overwhelming an individual's usual coping mechanisms are inadequate.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 19, Posttraumatic Stress Disorder, Data Base

**182. 3 The client will tend to avoid emotional attachment to significant others because this is a common way to protect the self from the experience of potential future losses. The priority at this time is to have family members develop an understanding of what is happening to the client.**

**1** Although it is important to keep the client safe and secure when in the home, the family should not restrict the client to the home environment. **2** Although issues concerning the client's problems need to be resolved, this is not the priority. **4** Although this discussion may be necessary, it is not the priority.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Anxiety Disorders

**183. 4 This increases the individual's ability to cope with stress; different defenses can be used in various situations.**

**1** The client already has identified the problem. **2** This may or may not be helpful. **3** People should not ignore situations that impact them.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, General Nursing Care of Clients with Anxiety Disorders

**184. Answer: 1, 3, 4, 5.**

**1** Excessive anxiety and worry about a number of events, topics, or activities for a 6-month duration are associated with a generalized anxiety disorder. **2** Acting-out anxiety with antisocial behavior is most commonly found in individuals with personality rather than anxiety disorders. **3** Regression is an attempt during periods of stress to return to behavior that has been satisfying and is appropriate at an earlier stage of development. **4** This is an example of a conversion disorder, which decreases anxiety. **5** This is typical of a phobic disorder, which decreases anxiety.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 19, Generalized Anxiety Disorders, Data Base

**185. 4 The fight-or-flight responses of the sympathetic nervous system are stimulated, causing an increase in blood glucose through glycogenolysis and gluconeogenesis.**

**1** The pupils dilate, not constrict, to facilitate the entry of visual stimuli. **2** The bronchioles dilate, not constrict, to facilitate gas exchange. **3** The blood pressure increases, not decreases, to shunt blood to vital centers.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 19, Generalized Anxiety Disorder, Data Base

**186. 3 Learning a variety of coping mechanisms helps reduce anxiety in stressful**

**situations.**

**1** A person must learn to cope with unpleasant events; they cannot be avoided. **2** Prolonged exposure may increase anxiety to possibly uncontrollable levels. **4** Fearful situations can never be viewed as pleasurable.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Anxiety Disorders

**187. 1** By staying physically close, the nurse conveys the message that someone cares enough to be there and that the client is a person worthy of care.

**2** The client is incapable of telling anyone what the problem is. **3** Sitting still will increase the tension the client is experiencing. **4** This is not an initial nursing intervention.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Panic Disorder, Nursing Care

**188. 3** The client is experiencing a psychological conflict that is manifested by a change in body function. Paralysis or blindness justifies the inability to move in any direction.

**1** It is an unconscious method of solving a conflict. **2** It is necessary for the client to focus on the problem causing the disorder, not on the cure. **4** It is more important that the client learn how to manage personal feelings before addressing family conflicts that may or may not exist.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Conversion Disorders, Data Base

**189. 2** Somatization is erroneously attributing an anxious feeling to a body system or part.

**1** Dissociation is separating an overwhelming event from one's consciousness. **3** The stress response results from being exposed to a threatening stimulus. **4** An anxiety reaction is the body's reaction to a stressful event.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Major Somatoform Disorders, General Nursing Care of Clients with Somatoform Disorders

**190. 3** The conversion type of defense tends to be a learned behavioral response that the individual will use when experiencing excessive stress.

**1** This is not a likely occurrence. **2** Psychiatric treatment may be needed at different times throughout life but usually not on a continuous basis. **4** Based on studies of this disorder, its course is somewhat predictable; it usually returns when the client is under severe stress.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Conversion Disorders, Data Base

**191. 3** The physical symptoms are not the client's major problem and therefore should not be the focus for care. This is a psychologic problem, and the focus should be in this domain.

**1** This is focusing on the physical symptom of the conflict; the client is not ready to give up the symptom. **2** The disorder operates on an unconscious level but is very real to

the client; this response denies feelings. **4** Psychotherapy is needed at this time, not physical therapy.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Conversion Disorders, Nursing Care

**192. 2 The client's anxiety results from being unable to choose psychologically between two conflicting actions. The conversion to a physical disability removes the choice and therefore reduces the anxiety.**

**1** The anxiety is not free-floating or diffuse but rather localized and converted to a physical disability. **3** The conversion of the anxiety to a physical disability occurs on an unconscious level; the original anxiety no longer exists, and the client generally is not anxious about the physical disability. **4** The anxiety is internalized into a physical symptom, not projected onto the environment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Conversion Disorder, Data Base

**193. 4 The psychophysiologic response (e.g., hyperfunction or hypofunction) creates actual tissue change. Somatoform disorders are unrelated to organic changes.**

**1** There is an emotional component in both instances. **2** There is a feeling of illness in both instances. **3** There may be a restriction of activities in both instances.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Conversion Disorders, Data Base

**194. 1 The client is using this compulsive behavior to control anxiety and needs to continue with it until the anxiety is reduced and more acceptable methods are developed to handle it.**

**2, 4** This will not change the client's behavior; the client cannot stop the compulsive act because it reduces anxiety. **3** This will greatly increase anxiety; compulsive behavior is a defense that cannot be interrupted until new defenses are learned.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**195. 1 By carrying out the compulsive ritual the client unconsciously tries to control anxiety by avoiding acting on unacceptable feelings and impulses.**

**2** This mechanism does not operate on a conscious level. **3** Hallucinations are not part of this disorder. **4** They feel no need to punish others.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Data Base

**196. 2 This sets an unrealistic limit that will increase anxiety by removing a defense the client needs.**

**1** This is done in therapy as the client's condition improves. Insight is slowly developed to minimize anxiety. **3** This will increase self-esteem and self-control, not increase anxiety. **4** This will reduce, not increase, anxiety, because the client will feel free to express feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**197. 4 These clients can work through their underlying conflicts more easily or productively when demands are reduced and the routine is simple.**

**1** Preventing these clients from carrying out rituals can precipitate panic reactions. **2** The intent of therapy should be to help the client gain control, not to enable others to do the controlling. **3** Since anxiety stems from unconscious conflicts, a controlled environment alone is not enough to effect resolution.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**198. 4 Knowledge of a schedule allows the client to prepare for transitions; hurrying can increase anxiety and the performance of the ritual. Routines will also decrease anxiety and the need for the ritual.**

**1** This is one of the objectives to be accomplished later during the client's hospitalization, not in the initial phase. Some clients will never be able to identify the purpose of their ritual beyond the fact that it helps decrease their anxiety. **2** This is not an initial intervention because it will increase anxiety. **3** This action is an appropriate intervention during the working phase of the nurse-client intervention, not the initial phase.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**199. 4 The symptoms are a defense against anxiety resulting from decision making, which triggers old fears; the client needs support.**

**1** This ultimately denies the client's overwhelming anxiety and lacks realistic support. **2** This is judgmental; the client should be encouraged to work through symptoms, not avoid risk. **3** This is judgmental; an increase in anxiety does not necessarily mean the client does not want to attain the goal.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**200. 4 The repeated thought or act defends the client against even higher, more severe levels of anxiety.**

**1, 3** To deny the client the ritual may precipitate panic levels of anxiety. **2** Usually these clients recognize that the ritual serves little purpose.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Data Base

**201. 3 This outcome will result from teaching the client to recognize situations that provoke ritualistic behavior and from the client learning how to interrupt the pattern.**

**1, 2** This is not a priority; the client probably had little difficulty in this area. **4** No evidence was presented to indicate the client was hallucinating.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**202. 3 Fluvoxamine (Luvox) blocks the uptake of serotonin, which leads to a decrease in obsessive-compulsive behaviors.**

**1** Benztropine (Cogentin) is an antiparkinsonian agent, not an antianxiety agent **2** Amantadine is an antiparkinsonian agent, not an antianxiety agent. **4** Diphenhydramine (Benadryl) is an antihistamine, not an antianxiety agent. **Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Data Base

**203. 1 The repeated act defends the client against severe anxiety; interruption of the ritual will result in increased anxiety.**

**2** The performance of a ritual is not anger turned inward on the self; the ritual reduces anxiety. **3** Rituals are not activities that enhance self-esteem; they control anxiety. **4** Pointing out that the behavior is inappropriate will further increase anxiety. The client does not want to perform the ritual, but feels compelled to do so to keep anxiety at a controllable level

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**204. 4 The client's exact adherence to carrying out the compulsive ritual relieves anxiety, at least temporarily. Furthermore, it meets a need and is necessary to the client.**

**1** The compulsive act is purposeless repetition and useful only in that it temporarily decreases anxiety for the client. **2** Urging has no effect on trying to have the client start or stop the ritualistic behavior. **3** The person cannot stop the activity; it is not under voluntary control.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**205. 4 Helping clients understand that a behavior is being used to control anxiety usually makes them more amenable to psychotherapy.**

**1** Treatment includes activities to help the client, not others. **2** The client usually understands this already. **3** This will only mask symptoms and will not get at the root of what is bothering the client.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**206. 4 Accepting these clients and their symptomatic behavior sets the foundation for the nurse-client relationship. Setting limits provides external controls and helps lower anxiety. This intervention is appropriate during the working phase, not the initial phase, of a therapeutic relationship.**

**1** Restricting movements will have no effect other than to increase anxiety. **2** This will increase their anxiety and increase their use of the behavior. **3** This is unrealistic.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Obsessive-Compulsive Disorder, Nursing Care

**207. 1 Clients with a somatoform disorder are preoccupied with the symptoms that are being experienced and usually do not want to talk about their emotions or relate them to their present situation.**

**2** Clients with a somatoform disorder do not seek opportunities to discuss their feelings. **3** Memory problems are not associated with somatoform disorders. **4** These clients want and seek treatment, not palliative care.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, General Nursing Care of Clients with Somatoform Disorders

**208. 4 This statement recognizes feelings and tells what is expected.**

**1** This is threatening and gives false reassurance; it puts the responsibility on the client and does not allow for expression of feelings. **2** This may lead the client to think that the environment is unsafe, which may increase insecurity and anxiety. **3** Being with other people in a strange situation will add more stress to the new and already frightening experience of hospitalization.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**209. 3 This is a direct response to the client's concern and allows some exploration of food choices.**

**1** Focusing on several caretakers does little to meet the client's basic security needs. **2** This does not address the client's comment that "no one cares." **4** This encourages dependency on the nurse; the message is "Do it for me, not because it is important for you."

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**210. 4 As depression increases, thought processes become slower and verbal expression decreases.**

**1** The affect of the depressed person usually is one of sadness, or it may be blank. **2** Loose associations are characteristic of clients with schizophrenia, not depressed clients. **3** Decreased physical activity will not produce physical exhaustion.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Major Depression, Data Base

**211. 1 Routines should be kept simple, and no demands should be made that the client cannot meet. The client is depressed, and all reactions will be slow. Putting pressure on the client will increase anxiety and feelings of worthlessness.**

**2** The client will have to focus on personal strengths, not on family strengths. **3** This feeds into the client's feelings of unworthiness and frustration. **4** Feelings of worth must come from within the individual; the nurse must reassure the client through actions,

not words.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**212. 1 Because major depression is due to the client's feelings of self-rejection, it is important for the nurse to have the client initially identify these feelings before a plan of care can be developed. Later discussion should be on other topics to prevent reinforcement of negative thoughts and feelings.**

**2** This is asking the client to draw a conclusion; the client may be unable to do so at this time. Also, a depression may not be related to external events but to a client's psychobiology. **3** Asking "why" does not let a client explore feelings; it usually elicits an "I don't know" response. **4** This is beyond the scope of the client's abilities at this time.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**213. 4 Bringing another client into a set situation is the most therapeutic, least-threatening approach.**

**1** At this point in time it is not therapeutic to allow the client to follow solitary pursuits; it will promote isolation. **2** Explanations will not necessarily change behavior. **3** This transfers the nurse's responsibility to the health care provider.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**214. 2 An art-type project that may be worked on successfully at one's own pace is appropriate for a depressed client.**

**1, 4** This requires too much concentration and may increase the client's feelings of despair. **3** This client is probably experiencing psychomotor retardation, and at this time this activity would not be appropriate.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**215. 2 This provides support and security without rejecting the client or placing value judgments on the behavior.**

**1** Eventually limits will have to be set in giving care, but staying with the client and showing acceptance are immediate nursing actions. **3** Although this will calm the client, it does not address the problem. **4** This ignores the problem; isolation implies punishment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**216. 3 Involving the client in a one-on-one conversation provides individualized, low-anxiety-producing attention and gives the message that the client is important, which**

**supports self-esteem.**

**1** This may require too much concentration for a depressed client. **2** This may require too much concentration for a depressed client; also, it involves competition, which is not therapeutic at this time. **4** A depressed client does not have the energy to engage in a game of Ping-Pong; also, this is a competitive game, which is not therapeutic at this time.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**217. 2 This statement identifies the importance of feelings and provides an opening for the client to talk about them.**

**1** The client is not going to believe this, and it is not helping the client to express feelings. **3** The nursing goal is to help people function outside the hospital environment and not be afraid to leave the hospital. **4** This statement is unrealistic and avoids the client's cry for help.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**218. 4 This statement points out reality while accepting that the client believes the feelings and thoughts are real.**

**1** This is false reassurance; there are no data about the client's family. **2** The client does not know this and believes the opposite to be true. **3** This is reality, but it is not a supportive response.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**219. Answer: 1, 2, 3, 4, 5.**

**1, 5** This intervention is required in this situation; physiological stability must be maintained. **2, 3** Suicidal impulses take priority, and the client must be stopped from acting on them while treatment is in progress. **4** A therapeutic relationship must develop so that the client can trust the nurse to provide a safe environment and help emotional recovery.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**220. 2 Directness is the best approach at the first interview because this sets the focus and concern and lets the nurse know what the client is feeling now.**

**1** At this point the client is most likely unable to think past the present, much less deal with future plans. **3** This is an indirect approach, but initially the direct approach is best. **4** This is one resource for input; but regarding suicide, it is best to approach the client directly.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**221. 1 Suicidal impulses take priority, and the client must be stopped from acting on them while treatment is in progress. The client's safety is the focus of nursing interventions.**

**2** This has a very low order of priority. The client is focusing on the present personal situation, not the outside world. **3** This is a secondary concern. **4** Reassurance will not change the client's belief.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**222. 4 This response recognizes feelings and behavior and encourages the client to share feelings; it also promotes trust, which is essential to a therapeutic relationship.**

**1** While it is important to record behavior and notify the health care provider, it is not enough and does not meet the client's needs. **2** This will not meet the depressed client's needs. **3** This assumes too much and may be inaccurate.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**223. 4 This acknowledges the client's feelings, offers hope, and assists the client to a higher level of functioning.**

**1** This ignores the client's feelings and may not be true. **2** This denies the client's feelings, and feeling better cannot be guaranteed. **3** This minimizes the client's feelings, and the client is not interested in how others feel.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**224. 1 These clients usually can be distracted by planned involvement in repetitious, simple tasks.**

**2** This should be employed only if the client's restlessness cannot be controlled with other measures and the physical exhaustion creates a danger. **3** This is abusive treatment for a client with a need to pace and reinforces the client's belief that punishment is required for redemption. **4** The client may perceive this isolation as a punishment, and it will prevent the staff from observing the client.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**225. 4 The nurse's response urges the client to reflect on feelings and encourages communication.**

**1** This is shifting responsibility from the nurse to the health care provider; it is an evasive response. **2** This is not what the client is asking the nurse; it closes the door to further communication. **3** This response can elicit a "yes" or "no" answer; it does not encourage communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**226. 4 A major part of depression involves an inability to accept the self as it is, which leads to making demands on others to meet unrealistic needs.**

**1** A short-term goal is to talk about the client's depressed feelings; a long-term goal is to look at what is causing those feelings. **2** Developing new defense mechanisms is not the priority because they tend to help the client avoid reality. **3** This is not important or crucial to the client's recovery.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**227. 2 This is the most therapeutic approach to prevent suicide. A staff member also provides special attention to help the client meet dependency needs and reduce a self-defeating attitude.**

**1** This response negates the client's feelings and cuts off further communication. **3** This is unrealistic because the nurse cannot be with the client constantly until the depression lifts. **4** Although this should be done, the priority is 24-hour observation of the client.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**228. 3 This gives the client the nonverbal message that someone cares and views the client as being worthy of attention and concern.**

**1** The concentration required for chess is too much for the client at this time. **2** The client is incapable of making decisions at this time. **4** Depressed clients often have too much thinking time.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive

Episode of a Bipolar Disorder, Nursing Care

**229. Answer: 1, 2.**

**1** In some people withdrawal, apathy, immobility, and irritability intensify when considering suicide. **2** This behavior indicates that the student expects no future. **3** It is typical to pay tribute to dead friends. **4** Talking about the event helps to resolve the conflict involved. **5** Becoming involved in school activities demonstrates a return to usual life patterns.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Data Base

**230. 4 Fatigue and apathy are symptoms of depression and should be accepted; however, limits should be set to facilitate participation in unit activities.**

**1** This allows the client to manipulate the environment. **2** This will not change the client's mind about the activities. This response does not show an understanding of the client's needs. **3** This will reinforce negative feelings about participating in the

activities.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**231. 4 This statement lets the client know the nurse realizes the client is having difficulty without asking direct questions or focusing on specific behavior.**

**1** This is an avoidance technique. **2** This response is stated more like an order than an offering of an opportunity to express feelings. **3** This is negating the client's feelings. The nurse should talk to the client without expectations that the client will "calm down."

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Communication/Documentation:** Nursing Process: Planning/Implementation; **Reference:** Ch 19, Major Depression, Nursing Care

**232. 2 Suicidal gestures involve superficial, nonlethal injuries; the client has no intent to die as a result of the injuries.**

**1** Suicidal threats are a person's verbal statement of intent to commit suicide; there are threats but no action. **3** Suicidal attempts are actual implementations of severe self-injurious acts; there is an attempt to cause serious self-harm or death. **4** Suicidal ideations are a person's thoughts regarding suicide; there is no definitive intent or action expressed.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Data Base

**233. 3 This question focuses the interaction toward the future and invites the client to explore alternative coping strategies.**

**1** This question explores past coping strategies and should have been asked as a part of the initial assessment. **2** This question attempts to explore the client's insight into present coping strategies, which should have been done before discussing the alternatives. **4** This question asks the client once more to ensure that all the precipitating stressors have been identified; this should have been done in the initial assessment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**234. 3 Spending extra time with the client demonstrates that the client is worthy of the nurse's time and that the nurse cares.**

**1** This does not show the acceptance and care that sitting with the client would. **2** The client may be unable, at this time, to expend energy on anything outside the self. **4** It is unlikely that the client will respond to the nurse because the client feels unworthy and depressed, or the client may just say no.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**235. 3 This statement demonstrates an understanding that the newly discharged client needs to have a support system when discharged. Clients need to feel that in a crisis there will be someone there for them.**

**1** The role of the nurse was not to become a good friend but to aid the client in becoming a functioning being again. **2** This statement provides false reassurance; the nurse does not know this. **4** This is unprofessional and blurs the roles of nurse and client.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**236. 3 This statement is honest and helps establish trust. Also, the client may realize that staff members care.**

**1** This response places the client on the defensive. **2** This is an inappropriate response to an obvious situation. **4** This is an evasive response.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**237. 2 This encourages the client to talk about feelings without the nurse setting the focus for the discussion.**

**1** This cuts off further communication of feelings; the client's statement may indicate a desire to act on the suicidal ideation. **3** This response does not foster communication and a discussion of feelings. **4** This will make the client wonder where the nurse had been for 4 days.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**238. 4 Ambivalence about life and death plus the introspection commonly found in clients with emotional problems can lead to increased anxiety and fear among the group members.**

**1** These feelings must be handled within the support and supervisory systems for the staff; the group members are the primary concern. **2** This probably will be a secondary concern of the group leader. **3** It is not a primary concern, but this should be explored later to determine the reason for such apparent indifference, which may be a mask to cover feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**239. 1 Electroconvulsive therapy, which interrupts established patterns of behavior, helps relieve symptoms and limits possible suicide attempts in clients with severe, intractable depression that does not respond to antidepressant medication.**

**2** The client's depressed mood limits participation in psychotherapy; feelings precipitated by therapy may lead to suicidal acting out. **3** Psychotherapy is directed toward helping the person learn new coping mechanisms and better ways of coping with problems; the depressed client needs direction to accomplish this. **4** Antianxiety

medications usually are not prescribed for clients with depression.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Data Base

**240. 1 Clients fear this therapy because they think it will be painful. If they are reassured that they will be asleep and have no pain, there will be less anxiety.**

**2** No treatment requiring anesthesia is totally safe. **3** Clients may not realize their own fears and not know what questions to ask; this statement cuts off further communication. **4** Temporary, not permanent, loss occurs.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Data Base

**241. 3 The staff's presence provides continued emotional support and helps relieve anxiety.**

**1** Although the client should be aware that this may occur, it is not the priority information that should be discussed with the client. Also, a mild analgesic will be prescribed if a headache occurs. **2** The treatments may not make the client feel better; this is false reassurance. **4** Not all clients experience amnesia, and the amnesia is temporary; placing emphasis on amnesia will increase fear.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Caring; Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**242. 4 The electrical energy passing through the cerebral cortex during electroconvulsive therapy (ECT) results in a temporary state of confusion after treatment.**

**1, 2, 3** This is not a usual or expected side effect.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Data Base

**243. 4 This response expresses the nurse's positive thoughts about the client while letting the client know that the nurse is concerned.**

**1** This demonstrates the nurse's positive thoughts about all people and does not focus on the client specifically. **2** Although this response may promote verbalization of feelings, it does not communicate the nurse's positive regard for the client, which might support a more positive self-esteem. **3** The client may not be aware of what caused feelings of insignificance and may not be able to answer this question.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**244. 2 Self-esteem and feelings of competence are increased when a person experiences success.**

**1** Although this is a necessary intervention when a depressed client attempts to commit self-harm, it will not promote feelings of self-esteem. **3** Clients recognize unwarranted

praise and often interpret these responses as a form of belittlement or pity. **4** This may or may not increase self-esteem; also, the client may not have the physical or emotional energy to interact with other clients.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Nursing Care

**245. 1 This response uses paraphrasing to demonstrate to the client that it is all right to talk about these feelings; it recognizes the client's sense of hopelessness without intensifying the feeling while providing an opportunity to verbalize further.**

**2** Although this may be a true statement, it takes the focus away from the client. **3** This information is insignificant at this time; this question might be appropriate after the client's feelings have been validated and discussed. **4** This takes the focus off the client's feelings and places it on a philosophical level.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**246. 1 Overactive individuals are stimulated by environmental factors. A responsibility of the nurse is to simplify their surroundings as much as possible.**

**2** The quiet client may become the target of this client's overactivity. **3** During this phase the client needs a decrease in stimuli. **4** During this phase the client needs a decrease in stimuli; placing two overactive clients together may produce excessive stimuli.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**247. 4 The client's behavior demonstrates increased anxiety. Since it was directed toward the new staff, it was probably precipitated by their arrival.**

**1** The client is not filling the "life-of-the-party" role; the client is resorting to previous coping behavior in the face of extreme stress. **2** This is possible, but the remark is more indicative of increased anxiety. **3** The client is aware of what is going on and who everyone is at this time.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Data Base

**248. 3 Recognizing the language as part of the illness makes it easier to tolerate, but limits must be set for the benefit of the staff and other clients. Setting limits also shows the client that the nurse cares enough to stop the behavior.**

**1** This statement shows little understanding or tolerance of the illness. **2** Ignoring the behavior is a form of rejection; the client is not using the behavior for attention. **4** This statement demonstrates a rejection of the client and little understanding of the illness.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**249. 1 A person with a condescending, superior attitude frequently evokes feelings of**

**anger in others, which helps to decrease their anxiety.**

**2** It is unlikely that a condescending, superior attitude will produce feelings of dependency in others. **3** It is unlikely that a condescending, superior attitude will produce feelings of inadequacy in others. **4** It is unlikely that a condescending, superior attitude will produce feelings of ambivalence in others.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**250. 3 During periods of hyperactivity the client has a short attention span and can be distracted easily; this is a therapeutic intervention for all the clients.**

**1, 4** This approach may increase anxiety, activity, and aggressive behavior. **2** The nurse should be empathetic, not sympathetic.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**251. 4 Physical activity will help use some of the excess energy without requiring the client to make decisions or forcing other clients to deal with the behavior.**

**1** The client's extreme activity limits concentration or task completion. **2** The client may disrupt the unit because of the excess activity and bossiness associated with this disorder. **3** The client needs guidance and is not able to guide others.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**252. 2 Hyperactive clients frequently will not take the time to eat because they are overinvolved with everything in their environment.**

**1** This is indicative of a depressive episode. **3** The client is unable to sit long enough with the other clients to eat a meal; this is not conscious avoidance. **4** The client probably gives no thought to food because of overinvolvement with the activities in the environment.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Data Base

**253. Answer: 4, 3, 5, 1, 2.**

**4** Diversional activities should be the first intervention attempted because it does not involve any restriction on client activities and manic patients are easily distracted. **3** Limit setting should be the next intervention attempted because it is minimally restrictive. **5** Medication administration, although considered a chemical restraint, is less restrictive than restraints or seclusion. **1** Seclusion is more restrictive but less restrictive than restraints. **2** Restraints are the most restrictive intervention in psychiatric nursing.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**254. 4 Clients who are out of control need controls set for them. The staff must understand that the client is not deliberately trying to disrupt the unit.**

**1** This is demeaning the client in the eyes of the other clients, and it does not address the problem directly. **2** Ignoring the client will not stop the disruptive behavior; the nurse has a responsibility to the other clients. **3** This may be a last resort taken to solve the problem but should not be used until other alternatives are explored.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**255. 3 Hyperactive clients burn up many calories, which must be replenished. Since these clients will not take the time to sit down to eat, providing them with food they can carry with them sometimes helps.**

**1** The client probably will not be aware of hunger and may go without food for a dangerously long time. **2** The client is not capable of preparing food at this time. **4** The client probably will not be aware of hunger and will not independently initiate eating.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Data Base

**256. 1 Hyperactive behavior in individuals such as this is typical of the manic flight into reality associated with mood disorders.**

**2** The behaviors are more indicative of a mood disorder than a personality disorder. **3** Ritualistic, not manic, behavior is indicative of obsessive-compulsive disorder. **4** A flat affect and apathy are more indicative of a schizophrenic disorder.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Data Base

**257. 1 This will help reduce the client's anxiety, thereby reducing hyperactivity.**

**2** It is not possible to physically control hyperactivity. **3** The client is not capable of choosing activities at this time. **4** The client may not be capable of controlling overactive behavior; setting verbal limits may not be effective.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**258. 3 The hyperactive client usually is easily distracted, so the excess energy can be redirected into constructive channels.**

**1** There is nothing to indicate that the client is not in touch with reality. **2** The client will talk a great deal with no encouragement. **4** The client will not be able to focus long enough on one task to finish it.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**259. Answer: 4, 5, 6.**

**1** Passiveness is exhibited when clients turn anger inward and show little emotion. It

frequently occurs during the depressive stage of bipolar disorder. **2** Dysphoria, a depressed, sad mood, is associated with the depressive stage of bipolar disorder. **3** Anhedonia, an inability to feel pleasure, is associated with the depressive stage of bipolar disorder. **4** Grandiosity is manifested by extravagant, pompous, flamboyant beliefs about the self, which frequently occur during manic phases of bipolar disorder. **5** As mania increases, the client's rate of speech increases, and speech is delivered with urgency (pressured speech). **6** Clients experiencing a manic episode have difficulty blocking out incoming stimuli, which results in distractibility and responses to irrelevant stimuli.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Data Base

**260. 1 The goal is 6 to 8 hours of rest at night; too much time spent sleeping in the daytime will defeat the goal of adequate rest at night.**

**2** This intervention contributes to the client's desire for relaxation and sleep. **3** This supports the client's hypersomnia; the client already sleeps too much. **4** This will increase the metabolic rate, which is not conducive to rest.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 19, Depressive Episode of a Bipolar Disorder, Data Base

# Nursing Care of Clients with Disorders Related to Alterations in Behavior

**261. 2 The client is too anxious to sleep in a four-bed room and should be moved to a private room.**

**1** Just talking about the problem will not improve it; moving the client to a private room is a better intervention at this time. **3** This response does not address the problem at its inception. **4** This is false reassurance.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Sleep Disorders, Nursing Care

**262. 2 Narcolepsy is overwhelming sleepiness that results in irresistible attacks of sleep, loss of muscle tone (cataplexy), and/or hallucinations or sleep paralysis at the beginning or end of sleep episodes; the person usually awakens from the sleep feeling refreshed.**

**1** Insomnia is difficulty in initiating or maintaining sleep. **3** Sleep terrors are recurrent episodes of abrupt awakening from sleep accompanied by intense fear, screaming, tachycardia, tachypnea, and diaphoresis with no detailed dream recall. **4** Sleep apnea is a breathing-related sleep disorder caused by disrupted respirations or airway obstruction; the usual sleeping pattern is disrupted numerous times throughout the night.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Sleep Disorders, Data Base

**263. Answer: 3, 5, 6.**

**1** A heavy meal places pressure against the diaphragm that may be uncomfortable, and the body is expending energy to digest the food. A light, not heavy, snack is preferred before bedtime. **2** The bed should be used exclusively for sleep so that the expectation when getting into bed is that sleep will be the outcome. **3** Lying in bed when one is unable to sleep increases frustration and anxiety, which further impede sleep; other activities, such as reading or watching television, should not be conducted in bed. **4** Although milk may promote sleep, tea contains caffeine, which is a stimulant that should be avoided after the midafternoon; otherwise, it may interfere with sleep. **5** Exercise during the day uses energy that promotes sleep at night; exercise too close to bedtime is stimulating and may interfere with sleep. **6** Counting backward requires minimal concentration, but it is enough to interfere with thoughts that distract a person from falling asleep.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Sleep Disorders, Nursing Care

**264. Answer: 1, 4, 6.**

**1** Acute or primary insomnia is caused by emotional or physical stress not related to the direct physiologic effects of a substance or illness. **2** Severe anxiety usually is related to a psychiatric disorder and therefore causes a secondary insomnia. **3** Generalized pain

usually is related to a medical or neurologic problem and therefore causes a secondary insomnia. **4** Excessive caffeine intake can cause disruptive sleep hygiene; caffeine is a stimulant that inhibits sleep. **5** Chronic depression usually is related to a psychiatric disorder and therefore causes a secondary insomnia. **6** Environmental noise causes physical and/or emotional discomfort and therefore is related to primary insomnia.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Sleep Disorders, Data Base

**265. 4 The problem is psychologic. Therefore, the nurse's initial approach should be directed toward establishing trust.**

**1** The client is convinced of being overweight; complimenting the adolescent will not change the adolescent's self-perception. **2** This may be a nursing intervention after trust has been established. **3** The client is not ready for this information.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, General Nursing Care of Clients with Eating Disorders

**266. 2 A goal focuses on where the client should be after certain actions are taken; this client needs to gain weight.**

**1** This may set up a struggle between the client and the nurse; the focus of care should not be on the actual intake of food. **3** Behavior modification techniques work much better than group therapy; these clients lack insight and will focus on food, not eating. **4** These clients talk freely about food; this is not therapeutic.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 20, Anorexia Nervosa, Nursing Care

**267. 3 This is objective proof that eating behaviors have improved.**

**1** "Stashing" of food is an eating disorder characteristic, not a sign of improvement. **2** This is subjective information and may be manipulative. **4** "Marathon meals" with little actual food ingestion is a common behavior of people with anorexia.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 20, Anorexia Nervosa, Nursing Care

**268. 3 Electrolyte imbalances can precipitate dysrhythmias that can be life-threatening.**

**1** Although clients with the diagnosis of anorexia nervosa have low self-esteem, and identifying and supporting strengths promote the development of a positive self-regard, this is not the priority at this time. **2** These clients are perfectionists who usually do not display impulsivity. **4** This is difficult to accomplish initially because these clients often deny the illness and evade therapeutic treatment.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Anorexia Nervosa, Data Base

**269. 3 These clients hide much of their bingeing and purging behaviors and, unlike clients with anorexia, may have near-ideal body weights.**

**1** Clients with bulimia nervosa usually are not obese. **2, 4** This is associated with clients with both anorexia and bulimia.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Bulimia Nervosa, Data Base

**270. 4 Realistic guidelines reduce anxiety, increase feelings of security, and increase adherence to the therapeutic regimen.**

**1** A controlling environment sets up a power struggle between these clients and the nurse. **2** These clients need realistic rules and regulations that they identify as helpful, not empathy. **3** This is not therapeutic; focusing on food may result in a power struggle between these clients and the nurse.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Bulimia Nervosa, Nursing Care

**271. Answer: 1, 2, 5.**

**1** Clients with borderline personality disorder often lead complex, chaotic lives because of the inability to control or limit impulses. **2** Extremes of emotions can be displayed over short periods of time and range from apathy and boredom to anger. **3** This is associated with obsessive-compulsive disorders. **4** This is associated with mood disorders such as depression. **5** Impulsive acts, such as reckless driving, spending money, or engaging in unsafe sex, often result in self-destructive consequences.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Personality Disorders, Data Base

**272. 4 Clients must first become aware of their behavior before they can change it.**

**1, 2** Confrontation may increase anxiety, anger, and agitation. **3** This occurs after the client is aware of behavior and has a desire to change it.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**273. 2 To gain control, clients often try to split the staff apart, separating the nurse from the rest of the treatment team; confidentiality is not expected to be maintained among professionals caring for a client, because it is detrimental to the client's therapy.**

**1** This response reinforces the team approach to care. **3** This response both reinforces the team approach and avoids providing false assurance that the information will be kept secret. **4** This does not provide false assurance that the information will be kept secret.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**274. 4 Clients with borderline personality disorder frequently demonstrate a pattern of unstable interpersonal relationships, impulsiveness, affective instability, and frantic efforts to avoid abandonment; these behaviors usually create great difficulty in establishing mutual goals.**

**1, 2, 3** Although the client with a borderline personality disorder may have difficulty in this area, it is not the most significant issue.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Data Base

**275. 3 Informing the client in a matter-of-fact tone indicates that negotiation is unacceptable.**

**1** Holding the client by the arm is an inappropriate use of force. The nurse should contact the police if the client continues to refuse to leave. **2** Raising the voice to a client indicates frustration and can be interpreted as threatening. **4** Using the baseball player to meet control issues indicates to the client that the nurse is unable to maintain control of the situation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**276. 4 These clients usually display social inadequacy and lack of emotional contact with others.**

**1** These behaviors probably reflect an obsessive-compulsive personality disorder. **2** These behaviors probably reflect a dependent personality disorder. **3** These behaviors probably reflect a narcissistic personality disorder.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Personality Disorders, Data Base

**277. 3 These clients are withdrawn, aloof, and socially distant; allowing distance and providing support may encourage the eventual development of a therapeutic alliance.**

**1** Manipulative behavior is typical of clients with the diagnosis of antisocial personality disorder or borderline personality disorder. **2** Group therapy will increase this client's anxiety; cognitive or behavioral therapy is more appropriate. **4** Seductive behavior is associated with clients with the diagnosis of histrionic personality disorder.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**278. 3 Clients with histrionic personality disorder draw attention to themselves, are vain, and demonstrate emotionality and attention-seeking behavior.**

**1** These are typical of clients with the diagnosis of narcissistic personality disorder. **2** These are typical of clients with the diagnosis of obsessive-compulsive personality disorder. **4** These are typical of clients with the diagnosis of antisocial personality disorder.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Personality Disorders, Data Base

**279. 3 Validating the client's frustration and correcting behavior are the most appropriate responses; safety is a priority.**

**1** This response does not validate the client's feelings. **2** Sending the client out of the room without offering support and direction is not an appropriate nursing response. **4** Threatening seclusion is an inappropriate nursing intervention.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**280. 3 These clients interact with others through manipulation, aggressiveness, and exploitation; therefore, clear limits must be set with consistently enforced consequences for crossing set boundaries.**

**1** These clients can be too assertive; this approach is appropriate for a client with the diagnosis of dependent personality disorder. **2** These clients need a firm, consistent

approach with clear and realistic limits on inappropriate behavior; this approach should be used with clients who have the diagnosis of avoidant personality disorder. **4** The nurse should provide a neutral, nonemotional approach with clear, realistic boundaries and consequences.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**281. 3 Individuals with this personality disorder tend to be self-centered and impulsive. They lack judgment and self-control and are unable to postpone gratification.**

**1** Generally, the opposite is true. **2** These individuals believe that the rules do not apply to them and they do not profit from their mistakes. **4** These people are too self-centered to have a sense of responsibility to anyone.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Personality Disorders, Data Base

**282. 3 Self-motivation and self-satisfaction are of paramount concern, and they have little or no concern for others.**

**1** Clients with an obsessive-compulsive disorder, not an antisocial personality disorder, engage in rituals. **2** These people are extremely dependent on others. They count on others to extricate them from their problems. **4** These people usually are charming on the surface and can easily “con” people into doing what they want.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Personality Disorders, Data Base

**283. 3 This response sets clear limits on their relationship and maintains a professional rather than a social role.**

**1** This response shifts responsibility from the issue at hand to the institution. **2** This response avoids the real issue and shifts responsibility to the ethical code. **4** This response does not clarify the nature of the relationship as professional.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**284. 2 When the individual consciously pretends to have an illness with no physical basis, it is called malingering.**

**1** People who are psychotic experience delusions, hallucinations, and disorganized thoughts, speech, or behavior. **3** A person out of contact with reality is unable to pretend to be ill. **4** The use of conversion defenses is not a conscious act.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Factitious Disorders, Data Base

**285. 4 This sets realistic limits on behavior without rejecting the client.**

**1** This will constitute a rejection of the client rather than the behavior. **2** This will encourage further manipulation by the client. **3** The other client is entitled to a special time with the nurse; this is inconsistent limit-setting on the part of the nurse.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Personality Disorders, Nursing Care

**286. 1 When a client has an adjustment disorder, anxiety may be related to a disturbance in self-esteem, and depression may be related to impaired social interaction.**

**2** Problems with memory are not specifically related to an adjustment disorder. **3** Activity intolerance, which is related to oxygenation problems, is not associated with adjustment disorders. **4** A client with an adjustment disorder does not experience a disturbance in personal identity.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Adjustment Disorders, Data Base

**287. 1 Intrinsic motivation, stimulated from within the learner, is essential if rehabilitation is to be successful. Often clients are most emotionally ready for help when they have "hit bottom." Only then are they motivationally ready to face reality and put forth the necessary energy and effort to change behavior.**

**2, 4** This is an important factor but not the most important one. **3** This is an important factor and a helpful one, but not the most important one.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

**288. 3 Thiamine is a coenzyme necessary for the production of energy from glucose. If thiamine is not present in adequate amounts, nerve activity is diminished and damage or degeneration of myelin sheaths occurs.**

**1** A traditional phenothiazine is a neuroleptic antipsychotic that should not be prescribed because it is hepatotoxic. **2** Antipsychotics are avoided; the use of these has a higher risk for toxic side effects in older or debilitated persons. **4** Chlorpromazine, a neuroleptic, will not be used because it is severely toxic to the liver.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Alcohol Abuse, Data Base

**289. 1 This presents reality and answers the client's question.**

**2** This is entering into the misperception of reality. **3, 4** This intervention provides comfort and may reduce anxiety, but it should follow the priority intervention of pointing out reality.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

**290. 2 Alcoholics Anonymous is a self-help group of individuals who meet together to attain and maintain sobriety.**

**1** A social group centers on building interpersonal relationships through participation in mutual activities. **3** A resocialization group centers on increasing social skills that may be diminished or lacking. **4** A psychotherapeutic group treats mental and emotional disorders by psychologic techniques and always has a member of the health care profession as its group leader.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data

Base

**291. 1 These clients often use denial as a defense against feelings of guilt; this will reduce anxiety and protect the self.**

**2** Denial may make a client seem more stable to others, not independent. **3** Denial deals more with a client's own expectations. **4** This may be part of the reason, but the bigger motivating factor is to decrease guilt feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

**292. 4 The individual is unaware of gaps in memory and therefore uses stories in an attempt to deny or cover up the gaps.**

**1** Lying is a deliberate attempt to deceive rather than a face-saving device for loss of memory. **2** Denying is blocking out of conscious awareness rather than a cover-up for loss of memory. **3** Rationalizing is used to explain and justify the behavior rather than to cover up the loss of memory.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

**293. 4 Members find empathy, patience, and understanding in the group. They are able to have their dependence needs met while helping others who are even more dependent.**

**1** This is helpful, but it does not have the success rate of AA. **2** This is important for the detoxification stage, not for overall therapy. **3** This may be helpful for some clients, but it does not have the success rate of AA.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

**294. 2 The CAGE screening test for alcoholism contains four questions, corresponding to the letters CAGE: C—Have you ever felt you ought to Cut down on your drinking? A—Have people Annoyed you by criticizing your drinking? G—Have you ever felt bad or Guilty about your drinking? E—Have you ever had a drink first thing in the morning (as an "Eye-opener") to steady your nerves or get rid of a hangover?**

**1, 3** This question is 1 of the 26 questions on the Michigan Alcohol Screening Test (MAST). **4** This question is 1 of the 10 questions on the Alcohol Use Disorders Identification Test (AUDIT).

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

**295. Answer: 1.5 mL. Solve for x by using the "Desire over Have" formula of ratio and proportion.**

$$\frac{\text{Desire}}{\text{Have}} \frac{7.5 \text{ mg}}{5 \text{ mg}} = \frac{x \text{ mL}}{1 \text{ mL}}$$

$$5x = 7.5$$

$$x = 7.5 \div 5$$

$$x = 1.5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

296. **2 This focuses on the client's feelings rather than the organization itself. The organization is effective only when the client is able to discuss feelings openly.**

**1** This may or may not be true. **3** This is false reassurance; AA may help clients develop insight but may not be able to help them cope with their problems. **4** This response does not focus on the client's feelings and may be discouraging.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

297. **1 The purpose of a self-help group is for individuals to develop their strengths and new, constructive patterns of coping.**

**2, 3, 4** This is just one of the purposes of group therapy.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

298. **3 This statement reflects the underlying theme in the client's statement and nonjudgmentally encourages the client to verbalize further.**

**1** This is a judgmental response that may cut off further communication. **2** Although this is a true statement, it does not promote further communication, nor does it promote continued attendance. **4** This is an inaccurate conclusion based on incomplete information; also, it is judgmental and may cut off further communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

299. **4 Referral to a community-based self-help group is an essential component of the discharge plan to provide ongoing support.**

**1** The client probably does not need a halfway house. **2, 3** Although some forms of therapy may be helpful, the most successful intervention for alcohol abuse is Alcoholics Anonymous.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

300. **3 Alcohol, a depressant, will result in rebound agitation with elevated vital signs**

**when there is acute abstinence. A further assessment is indicated, and then the health care provider should be notified of the client's status.**

**1** Although this may be done eventually, reducing environmental stimuli is an insufficient initial intervention. **2** Although this may be done eventually, constant observation is an insufficient initial intervention. **4** Although this may be done eventually, monitoring the client is an insufficient initial intervention in light of the client's elevated vital signs and changing status.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

**301. 4 When clients with alcohol problems voice a desire for help, it usually signifies they are ready for treatment because they are admitting they have a problem.**

**1** Adherence to an alcohol treatment program requires abstinence. **2** This is too short a time to signal readiness for treatment. **3** Hospitalization alone is not an indication that the client is really ready for treatment because many factors can influence admission.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

**302. 2 Attendance at AA meetings on a daily basis usually indicates an acceptance of the problem and a desire for help.**

**1** Attendance at counseling sessions is helpful but is not specific to the problem of alcoholism. **3** Clients with alcohol problems should not sponsor other clients until a long period of sobriety is maintained. **4** Clients with alcohol problems may say they are sorry many times but still not take responsibility for their drinking problem.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

**303. 1 The client must first acknowledge that a substance abuse problem exists and is creating chaos; verbalizing that a problem exists indicates that the client is not in denial and is demonstrating the first step toward a readiness to change.**

**2** Once a problem is identified, then the numerous ways that drug use has controlled the client's life can be explored. **3** Once a problem is identified, then the client can explore the use of substances and the resulting lifestyle problems. **4** Once a problem is identified, then the nurse can assist the client to express and process negative feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 20, Drug Abuse, Nursing Care

**304. 2 Methadone can be legally dispensed; the strength of this drug is controlled and remains constant from dose to dose, which is uncertain with illicit drugs.**

**1** Methadone is used in the medically supervised withdrawal period to treat physical dependence on opiates; it substitutes a legal for an illegal drug. Methadone may be administered long term to replace illegal opioid use. If methadone treatment is abruptly stopped, there will be withdrawal symptoms. **3** Methadone is a synthetic opioid and can cause dependence; it is used in the treatment of heroin addiction but may be prescribed for people who have chronic pain syndromes. It is not used for

acute postoperative pain. **4** Methadone is not known to have this action.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 20, Drug Abuse, Data Base

**305. 2 When methadone is reduced, a craving for opioids may occur, anxiety will increase, agitation will occur, and the client may try to leave the hospital to secure drugs.**

**1, 3** These are not related to methadone reduction. **4** These may occur with methadone overdose.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 20, Drug Abuse, Nursing Care

**306. 3 Constricted pupils is a physical response to opioid intoxication; the pupils will dilate with opioid overdose.**

**1** Opioids cause apathy or a depressed, sad mood (dysphoria); lability of mood is associated with the use of anabolic-androgenic steroids. **2** Opioids cause drowsiness and psychomotor retardation; alertness is associated with the use of stimulants such as caffeine and amphetamines. **4** Opioids depress the respiratory center of the brain, causing slow, shallow respirations; increases in temperature, pulse, respirations, and blood pressure are associated with cocaine use.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 20, Drug Abuse, Data Base

**307. 3 When naloxone is metabolized and its effects are diminished, the respiratory distress caused by the original drug overdose returns.**

**1, 4** There are no reports of these effects. **2** A combination of these drugs does not cause cardiac depression.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 20, Drug Abuse, Data Base

**308. 2 Stimulants increase the excitatory neurotransmitters (e.g., adrenaline and dopamine), which will lower the seizure threshold.**

**1** A person who is under heavy influence of stimulants will be unable to rest and sleep because of stimulation of the sympathetic nervous system. **3** Although dehydration can occur, it is not the priority concern. **4** Suicidality is of greatest concern during stimulant withdrawal, not when grossly impaired by stimulants.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 20, Drug Abuse, Data Base

**309. Answer: 1, 2, 5, 6.**

**1** Cocaine is an alkaloid stimulant; euphoria or affective blunting is associated with cocaine intoxication. **2** Cocaine is an alkaloid stimulant; agitation or anger is associated with cocaine intoxication. **3** Panic attacks are associated with hallucinogens. **4** Slurred speech is associated with opioids. **5** Cocaine is an alkaloid stimulant; hypervigilance is associated with cocaine intoxication. **6** Cocaine is an alkaloid stimulant; impaired judgment and impaired social functioning are associated with cocaine intoxication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 20, Drug Abuse, Data Base

310. **1 The greatest risk in cocaine withdrawal is risk for self-injury.**

**2** The risk for seizure is increased while under the influence of cocaine, not during withdrawal. **3** Although dehydration can occur during cocaine use and withdrawal, it is not the priority concern. **4** People in cocaine withdrawal, although irritable, are more apt to hurt themselves than others.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 20, Drug Abuse, Nursing Care

311. **2 If seizures were physiologically based, the client would not be able to continue to chew gum. This “attack” should be reported as a behavioral response, with the characteristics associated with the situation noted.**

**1** The chewing gum is not a danger when the client is not having a true seizure. **3** This is not necessary. **4** This is unsafe; it is not used in a true seizure.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:**

Ch 20, Factitious Disorders, Data Base

312. **2 Maintaining open communication is important for any therapeutic nurse-client relationship.**

**1** Confrontation will put the parent on the defensive and close off communication. **3** Health teaching at this time is premature; the parent is not ready for this approach. **4** Validation of the child’s physical status focuses on the physical symptoms, which will reinforce the parent’s behavior.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 20, Factitious Disorders, Nursing Care

# Nursing Care of Clients with Sexual and Gender Identity Disorders

**313. 1 Clients with these sexual disorders usually have many other emotional problems that may be overt or covert in nature.**

**2** There is no proof of a deficiency of these hormones. **3** This has no basis in fact. **4** There is expected development of sexual organs in individuals with paraphiliac sexual disorders.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 21, Paraphilias, Data Base

**314. 2 This identifies feelings and provides the client with an opportunity to talk.**

**1** This statement ignores feelings and does not help the client cope with the situation. **3** This may or may not be true and may be false reassurance. **4** The nurse does not know this to be a fact.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, Paraphilias, Nursing Care

**315. 4 The nurse is legally responsible to report suspected child abuse to the appropriate child protection agency. The agency must assess the situation and intervene if necessary to protect the child.**

**1** Asking the child to describe the touching may cause more psychologic trauma; the nurse should listen and demonstrate concern. **2** The nurse does not need any more data to have a reasonable suspicion of child abuse. It must be reported. **3** Contacting the father may result in more abuse or in the child not reporting future abuse.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, Paraphilias, Nursing Care

**316. Answer: 2, 1, 3, 4, 5.**

**2** Because “the self” is the most important factor the nurse brings to the nurse-client therapeutic relationship, the nurse must understand personal feelings about issues surrounding this client’s situation and needs; this is part of the preorientation phase of a therapeutic relationship. **1** In a therapeutic relationship the client is the focus of care, and the relationship should be based on respect. **3** In an atmosphere of respect, the client will then more likely express feelings. **4** The client considering sex reassignment surgery should explore all alternatives. However, once the decision is made, the nurse should support it. **5** After this important decision is made, the client may need assistance with how to inform significant others.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, Gender Identity Disorders, Nursing Care

**317. Answer: 1, 2, 3.**

**1** Flushing is a common central nervous system response to sildenafil

(Viagra). **2** Headache is a common central nervous system response to sildenafil. **3** Dyspepsia is a common gastrointestinal response to sildenafil. **4** Diarrhea, not constipation, is a common gastrointestinal response to sildenafil. **5** Hypotension, not hypertension, is a cardiovascular response to sildenafil. It should not be taken with antihypertensives and nitrates because drug interactions can precipitate cardiovascular collapse.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, Sexual Dysfunction, Nursing Care

**318. 2 Exposing the genitals and masturbating in a public place are unacceptable behaviors. Unacceptable behavior should be pointed out to the client and the client instructed to stop. Exhibitionism usually is done for shock value rather than as a preamble to sexual assault or rape. If the client wishes to masturbate, this activity can be carried out in private.**

**1** Unacceptable behavior should never be ignored. The client needs limits set on this type of behavior. **3** This may eventually be done. However, the client must first be given the opportunity to change his behavior. **4** Although the nurse must recognize that this behavior is related to his illness, it is not the nurse's role to seek out or prescribe medication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, General Nursing Care of Clients with Sexual and Gender Identity Disorders

**319. 1 This response communicates to the client that the nurse is willing and able to explore this concern. It is an open-ended statement that allows the client to control the direction of the conversation.**

**2** With this response the nurse abdicates responsibility to the health care provider. The nurse is capable and legally responsible to collect information and explore client feelings and concerns. **3** This response is premature; it moves immediately to a solution before adequate information has been collected. Also, the term *erectile dysfunction* is related to a medical diagnosis and its use at this time may increase client anxiety. **4** Although sexual functioning diminishes as men age, there are many factors that influence sexual functioning (e.g., physiologic problems, interpersonal conflicts, emotional stress).

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, General Nursing Care of Clients with Sexual and Gender Identity Disorders

**320. 2 This statement is related to a sexual arousal disorder, which is a partial or complete failure to achieve a physiologic or psychologic response to sexual activity.**

**1** This statement may indicate a sexual desire disorder in which the individual has deficient, absent, or extreme aversion to and avoidance of sexual activity. **3, 4** This statement is related to an orgasmic disorder, which is a delay in or absence of an

orgasm or premature ejaculation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 21, Sexual Dysfunction, Data Base

**321. 1 During the acute phase of mania, the focus of care should be on maintaining the safety of the client and others and decreasing the client's energy expenditure.**

**Hypersexuality is often associated with the manic episode of bipolar disorder.**

**Obtaining sexual pleasure by exposing the genitals (exhibitionism) is a paraphilia. A private room protects the other clients and provides privacy for the client.**

**2 The client is too hyperactive to engage in group activities, and hypersexual behavior may precipitate anxiety in the other clients. Also, manic clients can be overly competitive, which can disturb other clients. Activities at this time should be solitary or one-on-one with the nurse or nursing assistant. 3 Manic clients have flight of ideas (rapid racing thoughts) and are easily distracted. Introspection and the development of insight cannot occur during this phase of the illness. 4 The hyperactive client will not have the self-control to sit long enough to eat a meal. The nurse should provide finger foods (e.g., sandwich, fruit, milkshake) and encourage the intake of food with short declarative statements that direct the client to eat (e.g., "finish your sandwich," "eat this banana"). Also, hypersexual behavior may precipitate anxiety in the other clients.**

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

**Planning/Implementation; Reference:** Ch 21, General Nursing Care of Clients with Sexual and Gender Identity Disorders

**322. 4 Adults may have consensual sex as desired, but the nurse should encourage the use of birth control and protection from sexually transmitted infections.**

**1 The nurse is interjecting personal values by stating the client should seek counseling for this behavior. 2 The nurse is interjecting personal values by implying that the client's behavior is immoral. 3 If the sex is consensual it is not abusive.**

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 21, General Nursing Care of Clients with Sexual and Gender Identity Disorders

**323. 2 Masturbating is a healthy human sexual behavior. The client should be provided with private time. The client has the right to meet physical needs while not imposing the behavior on others.**

**1 Moving the roommate to another room could be ineffective because this may happen with the client's future roommate. 3 This response does not address either client's needs. 4 Masturbating is an acceptable human behavior if practiced in private.**

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 21, General Nursing Care of Clients with Sexual and Gender Identity Disorders

**324. 1 If a client reveals a predilection for pedophilia, it is most important to assess if the client has ever acted on these thoughts because the best predictor of future behavior is past behavior.**

**2 No human thoughts are unacceptable; therapy is indicated if they are ego-**

dystonic. **3** Humans may have bizarre sexual fantasies, but it is their behavior about which they will be judged, not their thoughts. **4** This is premature; the nurse has not obtained information about whether he has acted on these thoughts.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 21, Paraphilias, Nursing Care

**325. 3** When a client reveals something, it is important for the nurse to gather more information. This response promotes further communication. Assessment is the first step of the nursing process.

**1** This statement is a subjective, judgmental response by the nurse that reflects the nurse's view of sexuality in older adults. **2** This statement interjects the nurse's view and violates the concept of neutrality when counseling clients. **4** Having the client speak to his health care provider may be indicated eventually, but first the nurse must obtain more information.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 21, Sexual Dysfunction, Nursing Care

---

## UNIT 4

# Childbearing and Women's Health Nursing

# CHAPTER 23

# Nursing Care to Promote Childbearing and Women's Health

---

# Health Promotion

## Female Reproductive System

### ***Ovaries: Female Gonads***

A Located behind and below fallopian tubes, anchored to uterus and broad ligaments; size and shape of large almonds

B At birth, contain several hundred thousand graafian follicles (epithelial sacs in which ova develop) embedded in connective tissue

C Between menarche and menopause, one follicle matures each month, ruptures from ovarian surface, is expelled into pelvic cavity, and enters fallopian tube

D Functions

1. Oogenesis: formation of a mature ovum in graafian follicle
2. Ovulation: expulsion of ovum from follicle into pelvic cavity
3. Release of ovarian hormones: maturing follicle produces estrogens (estradiol, estrone, and estriol); corpus luteum produces progesterone and estrogens
  - a. Estrogens: stimulate development of secondary sexual characteristics (e.g., breasts, pubic hair) and thickening of endometrium; accelerate protein anabolism; stimulate long bone calcification
  - b. Progesterone: prepares endometrium for implantation of fertilized ovum; inhibits uterine contractions during pregnancy; promotes development of alveoli of estrogen-primed breasts in preparation for lactation

### ***Fallopian Tubes (Oviducts)***

A Location: attached to upper, outer angles of uterus

B Structure: distal ends fimbriated and open into pelvic cavity; mucosal lining of tubes and peritoneal lining of pelvis in direct contact

C Function: ducts through which ova travel from ovaries to uterus; location of fertilization

### ***Uterus***

A Location: in pelvic cavity between bladder and rectum

B Structure

1. Shape and size: pear-shaped, approximate size of clenched fist
2. Divisions
  - a. Corpus (body): upper, main portion; fundus is bulging upper area of corpus; two openings from fallopian tubes, one into cervix
  - b. Cervix: narrow, lower portion; internal os adjacent to uterus; external os adjacent to vagina; isthmus (lower uterine segment) separates corpus from cervix
3. Layers of uterus
  - a. Endometrium: inner layer
  - b. Myometrium: middle, muscular, thickest layer

c. Perimetrium: outer layer

C Location: over bladder in pelvic cavity; cervix joins vagina; ligaments (e.g., broad ligaments, uterosacral ligaments, posterior ligament, anterior ligament, round ligaments) maintain position of uterus

D Functions: menstruation, pregnancy, labor

## ***Vagina***

A Location: between rectum and urethra

B Structure: collapsible, musculomembranous tube, capable of distention; outlet to exterior covered by hymen (fold of mucous membrane)

C Functions

1. Receptacle for semen
2. Lower portion of birth canal
3. Excretory duct for uterine secretions and menstrual flow

## ***Vulva (External Genitalia)***

A Mons veneris: hairy, skin-covered pad of fat over symphysis pubis

B Labia majora: hairy, skin-covered folds

C Labia minora: small inner folds covered with modified skin

D Clitoris: small mound of erectile tissue, below junction of two labia minora

E Urinary meatus: opening into urethra; posterior to clitoris; anterior to vagina

F Vaginal orifice: posterior to urinary meatus; opening into vagina; hymen

G Skene glands: small mucous glands; ducts on each side of urinary meatus; prone to infection, especially gonococci

H Bartholin glands: two small glands; ducts on each side of vaginal orifice; prone to infection, especially gonococci

## ***Breasts (Mammary Glands)***

A Location: under skin, over pectoralis major

B Size: associated with deposits of adipose tissue, not amount of glandular tissue; glandular tissue approximately same in all females

C Structure

1. Internal: divided into lobes and lobules; excretory duct leads from each lobe to opening in nipple
2. External: nipples; areola (circular pigmented area surrounding nipples)

D Function: secrete milk (lactation)

1. Expulsion of placenta causes decrease in estrogens and progesterone that stimulates anterior pituitary to increase prolactin production; prolactin stimulates alveoli of breast to secrete milk
2. Suckling: controls lactation
  - a. Stimulates release of prolactin, which stimulates milk production
  - b. Stimulates posterior pituitary production of oxytocin causing release of milk from

alveoli into ducts (let-down reflex), enabling removal of milk by suckling

## Male Reproductive System

See [Chapter 12](#), Nursing Care of Clients with Urinary/Reproductive system Disorder:  
Review of Anatomy and Physiology of the Reproductive System, Structures of the Male  
Reproductive System

### Puberty

Period of reproductive organ maturation and preparation for reproductive function

A Physical and physiologic changes

#### 1. Females

- a. Occurrence: 9 to 15 years of age
- b. First sign: thelarche (breast budding)
- c. Later: acceleration of body growth; adrenarche (growth of pubic and axillary hair)
- d. Last: menarche (onset of menses); occurs after peak of growth spurt; ovaries produce estrogen; menstrual cycles may be anovulatory and irregular during first year

#### 2. Males

- a. Occurrence: 10 to 14 years of age; less dramatic than females'
- b. First sign: testicular growth; scrotal changes
- c. Ejaculation: starts early in puberty (wet dreams) with few active sperm
- d. Later: penile growth; pubic, axillary, and facial hair; deepening voice; body growth spurt; spermatogenesis (second year after onset); increased sweat gland activity; periodic erections and emissions of mature sperm

B Psychologic changes

1. Maturational changes according to age
2. Developmental task: identity versus role confusion
3. Need for belonging to peer group, increasing independence

## Menstrual Cycle

A Periodic vaginal bleeding related to changes in uterus and ovaries; cyclical from time of menarche to menopause

B Length of cycle: measured from onset of uterine bleeding to onset of next period of bleeding; mean cycle length is 28 days; range of 21 to 45 days

C Regulated by hormonal communication between hypothalamus and pituitary gland (hypothalamic-pituitary cycle) and ovaries and uterine endometrium

D Ovarian activity: during each cycle several follicles begin maturation process; usually one reaches full maturity, expels its ovum, which enters a fallopian tube

E Menstrual cycle phases

1. First phase (menstrual or ischemic): shedding of spongiosum endometrium with discharge through vagina

- a. Prostaglandin level in endometrium peaks causing vasoconstriction and myometrial contractions resulting in menstruation
- b. Low estrogen and progesterone levels stimulate release of follicle-stimulating hormone (FSH)
- c. FSH combines with low level of luteinizing hormone (LH) stimulating ovarian estrogen production

## 2. Second phase (follicular [ovary] or proliferative [endometrium])

- a. Endometrium regenerates and thickens in preparation for possible implantation
- b. Simultaneously, single dominant follicle develops from group of maturing follicles and approaches full maturation under influence of estradiol produced by ovarian follicles
- c. Rising blood levels of estradiol exert negative feedback on FSH production and positive feedback on LH production
- d. Estradiol's feedback effects are exerted on hypothalamic production of FSH-releasing hormone and LH-releasing hormone, which control hypophyseal production of FSH and LH
- e. Resulting surge in LH level causes ovulation
- f. Ovulation usually occurs 14 days before menstruation; ovum remains viable for 24 to 36 hours

## 3. Third phase (luteal [ovary] and secretory [endometrium])

- a. Begins after ovulation; relatively finite time period of about 12 to 14 days
- b. Continuing LH production forms temporary endocrine gland (corpus luteum) from ruptured follicle
- c. Granulosa and thecal cells of follicle enlarge, divide into and occupy cavity of follicle, and produce progesterone and estrogen
- d. Progesterone stimulates already proliferated endometrium to become glandular with a high glycogen-secreting potential (preparation for implantation)
- e. Without fertilization corpus luteum becomes nonfunctional 10 to 12 days after ovulation; progesterone and estrogen blood levels drop
- f. Negative feedback effect of estrogen on FSH ceases; first phase of menstrual cycle begins

## F Clinical applications

### 1. Family planning

- a. Contraceptive agents prevent pregnancy by inhibiting gonadotropin (FSH and LH) production, affecting both pituitary and hypothalamic centers
  - (1) Progestational agent suppresses LH production
  - (2) Estrogenic agent suppresses FSH production
- b. Synthetic preparations of estrogen-like and/or progesterone-like compounds are contained in oral, transdermal, vaginal, and parenteral contraceptive agents and some intrauterine devices

### 2. Premenstrual syndrome (PMS)

- a. Discomfort from ovulation to menstruation
- b. Clinical findings: bloating, breast tenderness, constipation/diarrhea, acne,

moodiness, fatigue, insomnia, backache, cramping

c. Therapeutic interventions

- (1) Dietary modifications (e.g., reduction of salt, refined carbohydrates, alcohol, caffeine)
- (2) Stress management, exercise, rest
- (3) Nonsteroidal inflammatory inhibiting agents (antiprostaglandin action) effective in relieving abdominal cramping associated with ischemic or menstrual phase of cycle; diuretics, progesterone, oral contraceptives also effective

3. Premenstrual dysphoric disorder

- a. Episodic depression during premenstrual phase
- b. Clinical findings: anger, irritability, depressed mood, anxiety, tension, apathy, eating problems
- c. Therapeutic interventions: similar to those for other depressions
  - (1) Hypnotherapy
  - (2) Relaxation therapy
  - (3) Dance/movement therapy
  - (4) Antidepressants

## Perimenopause

A Perimenopause (climacteric): gradual cessation of ovarian function and menstrual cycles; begins between age 40 and 60, average age 51; lasts 2 to 10 years

B Menopause: cessation of menstrual periods for 12 consecutive months

C Postmenopause: time after menopause

D Physiologic changes

1. Ovaries: loss of ability to respond to gonadotropic hormones; dramatic decrease in levels of circulating estradiol and progesterone
2. FSH gonadotropin blood level: increased because ovarian production is no longer inhibited; false-positive pregnancy test may occur

E Clinical applications

1. Atrophic changes in reproductive organs or hormonal stimulation of sympathetic nervous system
  - a. Early manifestations: dyspareunia, weight gain, facial hair growth, cardiac palpitations, hot flashes, profuse diaphoresis, constipation, pruritus, faintness, headache
  - b. Long-range manifestations: osteoporosis, cardiovascular disease
  - c. Emotional/behavioral responses: irritability; anxiety about loss of reproductive function, libido, feelings of womanliness
2. Therapeutic interventions
  - a. Hormone replacement therapy (HRT): eases transition through perimenopause (e.g., controls vasomotor instability, reduces atrophic genitourinary changes), reduces risk for cardiovascular disease, and prevents osteoporosis; used

judiciously and on an individual basis because of cancer-causing potential

- b. Alternative therapy: herbal supplements, diet management, relaxation modalities, exercise
- c. Instruction about menopausal changes
- d. Provision of opportunity to discuss feelings

# Family Planning

## Contraceptive Methods

### *Data Base*

A Oral contraceptives: inhibit ovulation; atrophic changes in endometrium prevent implantation; thickened cervical mucus inhibits sperm travel

1. Combined forms (estrogen and progesterone): inhibit hypothalamus, pituitary, and other hormone production
  - a. Monophasic: fixed doses of estrogen and progestin in each pill
  - b. Biphasic: altered amounts of estrogen and progestin; reduces total dosage of hormones each month
  - c. Triphasic: small doses of combined hormones that alter levels of estrogen and progestin throughout cycle; reduces total dosage of hormones each month
  - d. Advantages of combined oral contraceptives: 100% effective if taken consistently; coitus independent (not taken in relation to intercourse); predictable bleeding days; may alleviate PMS, endometriosis, dysmenorrhea
  - e. Examples: ethinyl estradiol/ethynodiol (Kelnor); ethinyl estradiol/norethindrone (Loestrin, Ortho-Novum)
2. Minipills: low dose progesterone; inhibit ovulation by making uterine environment hostile to sperm; must be taken same time daily because dose is low
  - a. Advantages: few side effects; can be used by lactating women, women older than age 35, those with history of headaches and mild hypertension
  - b. Example: norethindrone (Micronor)
3. Major side effects
  - a. Thrombophlebitis (increased platelets and clotting factors, intimal thickening, vein dilation)
  - b. Hypertension, breast tenderness (fluid retention)
  - c. Libido changes (hormonal effect)
  - d. Hyperglycemia (decreased carbohydrate tolerance)
  - e. Central nervous system (CNS) disturbances (hormonal effects, fluid retention)
  - f. Breakthrough bleeding (estrogen effect)
4. Contraindications: older than age 35; cigarette smoking; hypertension; thrombophlebitis; breast malignancy; vascular or heart disease

B Intrauterine devices (IUDs): device inserted into uterus; prevents fertilization or implantation

- a. Copper IUD damages sperm and few reach ovum
- b. Levonorgestrel uterine system IUD: releases levonorgestrel in uterus to maintain thick mucus that is hostile to sperm; may cause uterine irritability, bleeding, risk for infection
- c. Inserted by health care provider

C Diaphragm: shallow round rubber or latex device with flexible rim; fits over cervix;

prevents sperm from entering cervical os; used with spermicide; fitted by health care provider

D Cervical cap: rubber thimble-like device; filled with a spermicide; fits over cervix; protects for up to 48 hours after insertion; fitted by health care provider

E Vaginal ring: hormonal control; worn for 3 weeks with a 1-week break; prescription required; fitting not required

F Female condom: latex vaginal elongated pouch with ring at each end; one ring covers cervix, other covers labia; available over-the-counter (OTC)

G Male condom: latex sheath covers penis; prevents semen from entering cervical os; OTC

H Spermicidal creams, jellies, foam tablets, and vaginal suppositories: spermicidal generally of low pH; inserted into vaginal canal by applicator immediately before coitus; may be used in conjunction with diaphragm and condom for added protection

I Coitus interruptus: withdrawal during sexual intercourse before ejaculation; least effective method

J Fertility awareness methods (FAM): contraceptive method depends on identifying beginning and end of fertile period and periodic abstinence during fertile period; multiple fertility awareness methods may be used concurrently

a. Basal body temperature: temperature dips slightly 24 hours before ovulation, then rises sharply; stress and infection can elevate temperature, diminishing effectiveness

b. Cervical mucus ovulation-detection (Billings): based on amount and consistency of cervical mucus before, during, and after ovulation

c. Other methods: calendar rhythm; standard days, symptothermal, Two Day Algorithm

K Norplant system (implantable progestin): placement of six flexible rods of levonorgestrel under skin of upper arm; effective for 5 years; removal restores fertility; irregular periods may occur

L MedroxyPROGESTERone (Depo-Provera) intramuscular (IM) injection lasts 3 months; suppresses FSH and LH

M Emergency contraception (EC): used after unprotected intercourse ("morning after pill"); pharmacologic management with high dose of estrogen, progesterone, or testosterone; may be available OTC in some states

N Surgical sterilization

1. Male: bilateral vasectomy; vas deferens is ligated via small incision into scrotum; prevents ejaculation of sperm

2. Female: tubal ligation; interruption in continuity of fallopian tubes by surgical transection, electric cautery, or compression with soft clamp; performed via laparotomy, laparoscopy, or culdoscopy; prevents impregnation of ovum by sperm

## ***Nursing Care of Clients Concerned with Family Planning***

## Assessment/Analysis

1. Health and family history
2. Beliefs and feelings about sexuality, pregnancy, contraception, and abortion
3. Understanding of family planning
4. Readiness to learn

## Planning/Implementation

1. Help to expand knowledge about human sexuality
2. Teach couple available methods
3. Assist in choosing most appropriate method (e.g., barrier techniques preferred for women with diabetes mellitus or heart disease)
4. Recognize own feelings regarding contraception: provide accepting atmosphere when decision is made
5. Teach about oral contraceptives
  - a. Specific medication/administration schedule
  - b. Procedure to follow if a dose is missed
  - c. Side effects (e.g., vaginal bleeding)
  - d. Notification of health care provider if adverse effects occur
6. Encourage complete periodic gynecologic examination for all women using any contraceptive method; should include breast and pelvic examination, Papanicolaou (Pap) test, mammography
7. Teach couples electing surgical sterilization
  - a. Female: sterility is immediately achieved
  - b. Male: sterility not achieved until semen is free of sperm; use of another birth control method required until semen is free of sperm (e.g., usually after 15 ejaculations, ejaculate examined for presence of sperm)

## Evaluation/Outcomes

1. Prevents conception unless desired
2. Returns for follow-up health care
3. Institutes schedule of regular gynecologic and breast examinations

## Infertility and Sterility

A Infertility: inability to conceive after consistent attempts for a 1-year period; woman has never conceived; man has never impregnated a woman

1. Primary: couple has never had a child
2. Secondary: couple has conceived but woman is unable to sustain pregnancy or conceive again

B Sterility: unable to produce offspring; may be genetic, acquired, or elective

C Male infertility and sterility

1. Coital difficulties: chordee (painful, downward-curving erection); marked obesity

2. Spermatozoal abnormalities: small ejaculatory volume; low sperm count; increased viscosity; reduced sperm motility; more than 30% abnormal sperm forms
3. Testicular abnormalities: agenesis or destruction of testes; cryptorchidism; torsion of the testes; physical impairment caused by trauma (e.g., mumps, irradiation, prolonged exposure to increased temperature)
4. Varicocele: enlarged vein in testicle
5. Abnormalities of penis or urethra: hypospadias, urethral stricture
6. Prostate and seminal vesicle abnormalities: chronic prostatitis, seminal vesiculitis
7. Abnormalities of epididymis and vas deferens: inflammation, closure
8. Severe nutritional deficiencies
9. Sexually transmitted infections
10. Other factors: radiation to testicles; excessive smoking of tobacco, marijuana; excessive alcohol intake; in utero exposure to diethylstilbestrol (DES)
11. Decreased libido and impotence; related pathologic, physiologic, and/or psychologic factors
12. Environmental factors: frequent hot tub use, exposure to Agent Orange

#### D Female infertility and sterility

1. Endocrine disorders: pituitary, thyroid, adrenal
2. Vaginal disorders: absence or stenosis of vagina, imperforate hymen, vaginitis, chronic infections
3. Cervical abnormalities: obstruction by cervical polyps or tumors
4. Uterine abnormalities: hypoplasia, endometriosis, neoplasms
5. Tubal disorders: obstruction usually caused by sexually transmitted infections (e.g., chlamydia, gonorrhea), perisalpingeal adhesions
6. Ovarian abnormalities: congenital (e.g., partial or total absence of or abnormal function of ovaries), infections, tumors, multiple cysts, hormonal imbalances
7. Emotional problems: severe psychoneurosis or psychosis may cause anovulatory cycles
8. Coital factors: acidic feminine hygiene preparations (including douches) that decrease vaginal pH and inactivate or destroy spermatozoa; sodium bicarbonate douches may be prescribed to raise vaginal pH
9. Chronic illnesses
10. Immunologic reactions to sperm
11. Nutritional factors: malnutrition, anorexia nervosa
12. Exposure to diethylstilbestrol (DES) in utero
13. Environmental factors: teratogenic household cleaning products

#### E Combined factors

1. Lack of coital success
2. Female antibodies to male sperm

#### F Diagnostic measures

1. Genetic testing
2. Male: history, physical examination, semen analysis
3. Female: history and physical examination; blood tests (e.g., complete blood count [CBC], sedimentation rate); serologic tests; urinalysis; thyroid hormone and thyroid-

stimulating hormone (TSH) levels; x-ray films of chest; basal metabolic rate determination; postcoital (Sims-Huhner) test; ultrasonography; endometrial biopsy; hysterosalpingography; culdoscopy; urine luteinizing hormone predictor kits (measure LH in urine to predict ovulation); laparoscopy; chlamydia test

#### G Therapeutic interventions

1. Education about menstrual cycle and timing of intercourse
2. Surgery, depending on cause
3. Pharmacologic management to correct deficiencies, induce ovulation
4. Intrauterine insemination (IUI)
5. In vitro fertilization (IVF)
6. IVF with intracytoplasmic sperm injection for severe male infertility
7. Stress management
8. Embryo transfer
9. Surrogate motherhood
10. Adoption

#### H Related Pharmacology

1. Androgens (testosterone derivatives) for males
  - a. Replace deficient hormones after puberty; improve development of secondary sex characteristics
  - b. Adverse effects: adolescents may have premature epiphyseal closure, decreased skeletal development, cessation of growth
2. Estrogens for females
  - a. Replace deficient hormones; maintain menses and fertility during reproductive years; control hormonal balance in menopausal or postmenopausal women
  - b. Adverse effects: anorexia (depression of appetite center); nausea and vomiting (gastrointestinal irritation); tissue fluid accumulation (altered tissue hydrostatic pressure); cessation of growth
3. Conception enhancers
  - a. Ovulatory stimulants
    - (1) ClomiPHENE (Clomid); follicle-maturing agent used during the fifth to tenth days of menstrual cycle
    - (2) Purified FSH: urofollitropin (Bravelle); act on ovarian follicles
    - (3) Human menopausal gonadotropin: (Repronex, Menopur); stimulates growth and maturation of ovarian follicles
    - (4) Human chorionic gonadotropin (Ovidrel, Pregnyl); induces ovulation
  - b. Hormone replacement therapy with conjugated estrogens and medroxyPROGESTERone (Depo-Provera, Prempro)
  - c. Drugs for hyperplasia defects
    - (1) Danazol: reduces endometrial hyperplasia (endometriosis); acts on estrogen receptors to inhibit estrogen defects
    - (2) PredniSONE: reduces adrenal hyperplasia
  - d. Adverse effects of conception enhancers
    - (1) Multiple births (causes simultaneous maturation of follicles)

- (2) Visual changes (direct toxic effect)
- (3) Dizziness, lightheadedness (CNS depression)
- (4) Hyperplasia reduction drugs: androgenic effect causing weight gain, hirsutism, decreased breast size, skin oiliness

# Related Procedures

## Routine Health Screening for Women

See [Table 23-1](#): Breast and Reproductive Health Screening for Women

**Table 23-1**

### Breast and Reproductive Health Screening for Women

Screening Test	Ages 18-39	Ages 40-49	Ages 50-64	Ages 65 and older
<b>Breast Health</b>				
Mammogram (x-ray of breast)		Every 1-2 years Discuss with health care provider	Every 1-2 years Discuss with health care provider	Every 1-2 years Discuss with health care provider
Clinical breast exam	At least every 3 years starting during 20-29 years of age	Yearly	Yearly	Yearly
<b>Reproductive Health</b>				
Pap test	Every 2 years starting at 21 years of age Every 3 years for women 30 years of age and older	Every 3 years	Every 3 years	Discuss with health care provider
Pelvic Exam	Yearly beginning at 21 years of age Discuss with health care provider if younger than 21 years of age and sexually active	Yearly	Yearly	Yearly
Chlamydia test	Yearly until 25 years of age if sexually active Necessary when there is a new or multiple partners when 26 years of age or older	Necessary when there is a new or multiple partners	Necessary when there is a new or multiple partners	Necessary when there is a new or multiple partners
Sexually transmitted infection (STI) tests	Necessary for both partners for STIs, including HIV, before initiating sexual intercourse	Necessary for both partners for STIs, including HIV, before initiating sexual intercourse	Necessary for both partners for STIs, including HIV, before initiating sexual intercourse	Necessary for both partners for STIs, including HIV, before initiating sexual intercourse

## Pelvic Examination

### A Definition

1. Examination of female reproductive structures
  - a. Abdominal examination
  - b. Inspection and palpation of external genitalia
  - c. Observation of vagina with speculum to inspect cervix and vaginal walls; rectal examination may follow
2. Specimens for testing
  - a. Gonorrheal culture from endocervical canal
  - b. *Chlamydia trachomatis* smear from urethra and cervix
  - c. Herpes simplex 1 and 2 viral culture of smear from lesion
  - d. Cytologic examination (Papanicolaou [Pap] test) of cells from endocervical canal and cervix

### B Nursing care

1. Explain examination and collection of specimens
2. Teach to avoid douching 24 hours before examination
3. Request to empty bladder before examination
4. Help relaxation by instructing to
  - a. Breathe slowly and deeply, exhaling with mouth open and lips in “O” shape

- b. Avoid squeezing eyes closed or clenching fists
- 5. Bear down when speculum is introduced
- 6. If pregnant; assess for hypotension (e.g., pallor, dizziness), tachycardia, nausea, diaphoresis; position on side until symptoms subside and vital signs are acceptable
- 7. Teach about cervical cancer
  - a. Early signs: vaginal discharge, spotting between menstrual periods or after intercourse
  - b. High cure rate if identified early

## Mammography

A X-ray study of soft tissue of breast; detects nonpalpable masses

B Nursing care

1. Instruct to avoid using deodorants, powders, or intake of caffeinated drinks before test
2. Maintain privacy
3. Explain that stretching and compression of breast tissue may be uncomfortable
4. Encourage yearly clinical breast examination; explain reason for ultrasonography to distinguish between cyst and tumor

## Breast Biopsy

A Procedure to obtain fluid or tissue

1. Fine needle aspiration
2. Core needle biopsy
3. Needle localization biopsy

B Nursing care

1. Explain procedure
2. Allow time to express feelings
3. Instruct to assess site for bleeding or edema
4. Stress importance of continued health care supervision

## Induced Abortion

### **Data Base**

A Mifepristone and misoprostol

1. Mifepristone is administered orally up to 9 weeks after conception; bleeding begins within 4 days; may be combined with prostaglandin; noninvasive. Misoprostol may be administered vaginally 1-3 days after mifepristone is administered to enhance uterine contractions and expulsion of the uterine contents; a follow-up is made within 14 days to ensure all products of conception are expelled
2. Mifepristone is administered orally and misoprostol vaginally in 24 to 48 hours with a follow-up visit in 4 to 8 days

B Prostaglandin: administered vaginally

1. Used after 9 weeks to trigger vasoconstriction and uterine contractions that interfere with endocrine function of placenta (e.g., carboprost [Hemabate], dinoprostone [Prostin E])
  2. Adverse effects: nausea, vomiting, diarrhea, pain at extrauterine sites, allergic reactions (not administered to clients with history of asthma)
- C Vacuum aspiration: done under local paracervical, epidural, or general anesthesia in first 12 weeks of pregnancy; the cervix is dilated (using mechanical means) and products of conception are suctioned through a small, hollow tube
- D Dilation and curettage: performed during the first 12 to 14 weeks of pregnancy under local paracervical or general anesthesia; the cervix is mechanically dilated and uterus is scraped and cleaned by curettage
- E Saline injection
1. Labor is induced when a pregnancy is 14 to 24 weeks' duration by injecting a sterile saline solution into the uterus during an amniocentesis; labor usually begins within 8 to 24 hours after instillation of saline; produces a macerated fetus
  2. Adverse effect: headache caused by hypernatremia
- F Hysterotomy: performed after 16 weeks of pregnancy by surgically removing the fetus and placenta abdominally
- G In the third trimester, although rarely used, high doses of intravenous oxytocin may be used after an injection of salt water, potassium chloride, or urea is injected into the amniotic sac

## ***Nursing Care of Women Undergoing Induced Abortion***

### **Assessment/Analysis**

1. History and physical examination
2. Specimens for laboratory tests
3. Rh status
4. Length of pregnancy
5. Level of anxiety
6. Understanding of procedure and postprocedure care

### **Planning/Implementation**

1. Emotional considerations
  - a. Awareness of own feelings about induced abortion necessary to provide therapeutic care
  - b. Avoid counseling if negative feelings are strong
  - c. Encourage expression of feelings
  - d. Support client's decision about abortion objectively
2. Obtain informed consent
3. Counsel concerning contraceptive methods if requested
4. Administer RhoGAM if Rh negative and no antibodies detected

5. Teach to
  - a. Avoid tampons for 3 days to 3 weeks, depending on protocol
  - b. Avoid intercourse for 1 to 2 weeks, depending on protocol
  - c. Report fever, bleeding that requires change of peripad every 2 hours or less

## **Evaluation/Outcomes**

1. Expels products of conception
2. Remains free from complications
3. Returns for health supervision
4. Expresses feelings
5. Indicates acceptance of nonpregnant state

# Related Pharmacology

## Estrogens

(See Infertility and Sterility for drugs that affect gonadal function and fertility)

A Description: Organic compounds produced by ovarian follicles in females; exert effect during proliferative phase of menstrual cycle

B Therapeutic uses

1. Regulate menstrual disorders, uterine bleeding, menopausal and postmenopausal problems
2. Hormonal therapy for men with certain cancers of reproductive/urinary system (has cancer-causing potential)
3. Prevent unwanted pregnancy: oral contraceptives

C Available in oral, parenteral (IM, IV), intravaginal, topical, transdermal, preparations, (e.g., estradiol preparations [Estrace, Estraderm], conjugated estrogens [Premarin, Cenestin])

D Major side effects

1. Thrombophlebitis (increased clot formation)
2. Nausea (irritation of gastric mucosa)
3. Breast tenderness (sodium and water retention)
4. Hyperglycemia (decreased carbohydrate tolerance)
5. Males: gynecomastia, loss of libido, testicular atrophy (hormonal imbalance related to estrogen antagonism)
6. Deficiency of one or more of B complex vitamins with prolonged therapy

E Nursing care

1. Obtain history to assess contraindications for use (e.g., cancer of reproductive organs, thromboembolic disorders, breastfeeding, pregnancy)
2. Assess for edema
3. Instruct to
  - a. Use specified procedure for application of topical or intravaginal preparations
  - b. Report unusual vaginal bleeding immediately
  - c. Avoid smoking during therapy to decrease risk for cardiovascular side effects
  - d. Eat foods rich in B complex vitamins daily; B complex vitamin supplements should be considered
4. Monitor blood glucose levels for hyperglycemia
5. Reassure male clients that feminizing side effects will subside when therapy is completed

## Progestins

(See Infertility and Sterility for drugs that affect gonadal function and fertility)

A Description: female ovarian hormones that prepare uterus for implantation of fertilized ovum; essential for maintenance of pregnancy

B Therapeutic uses: treatment of endometriosis, infertility, dysmenorrhea, secondary amenorrhea, and suppression of ovulation

C Available in oral and parenteral (IM) preparations (e.g., MedroxyPROGESTERone [Provera, Depo-Provera], Megestrol [Megace], Norethindrone [Micronor], Progesterone [Prometrium])

D Major side effects

1. Profuse vaginal flow (shedding of endometrial tissue), spotting, irregular bleeding, nausea, lethargy, jaundice
2. Edema (sodium and water retention)
3. Genitourinary disturbances (renal dysfunction)
4. Visual disturbances (blood clots, neuro-ocular lesions)
5. Scleral jaundice (hepatic alterations)
6. Thrombophlebitis (increased clot formation)
7. Depression (CNS effect)
8. Deficiency of one or more B complex vitamins from prolonged use

E Nursing care

1. Obtain history to assess contraindications for use (e.g., thromboembolic disorders, reproductive cancer, hypersensitivity)
2. Assess for edema
3. Inform client and significant others regarding potential for depression
4. Instruct to eat foods rich in the B complex vitamins daily; B complex vitamin supplements should be considered

# CHAPTER 24

# Nursing Care Related to Major Disorders Affecting Women's Health

---

# Major Disorders Affecting Women's Health

## Cancer of the Cervix

### **Data Base**

#### A Etiology and pathophysiology

1. Slow, malignant change in tissue-forming neck of uterus at squamocolumnar junction
2. Risk factors
  - a. Multiple sex partners
  - b. Sexually transmitted infections
  - c. Exposure to human papillomavirus (HPV), human immunodeficiency virus (HIV), or herpes simplex virus (HSV)
  - d. Erosions of cervix, often resulting from changes in pH that can be precursors of cancer
  - e. Exposure to diethylstilbestrol (DES) in utero, which increases risk for vaginal cancer
3. High cure rate when diagnosed early
4. Tends to spread by direct invasion of surrounding tissues; metastasizes to lungs, bones, liver

#### B Clinical findings

1. Subjective (when invasive): back and leg pain
2. Objective
  - a. Spotting between menstrual periods and after intercourse
  - b. Vaginal discharge
  - c. Lengthening of menstrual period
  - d. Papanicolaou (Pap) cytologic finding of cellular changes consistent with precancerous or cancerous conditions

#### C Therapeutic interventions

1. Prevention: human papillomavirus vaccine (three doses between 11 and 12 years of age)
2. Type of surgical intervention depends on extent of lesion and client's physical status
  - a. Stage 0—carcinoma in situ, limited to epithelial layer
  - b. Stage I—confined to cervix
  - c. Stage II—extends beyond cervix but not to pelvic sidewall
  - d. Stage III—extends to pelvic sidewall and lower vagina
  - e. Stage IV—extends beyond pelvis to bladder or rectum
3. Hysterosalpingo-oophorectomy (panhysterectomy): removal of uterus, fallopian tubes, and ovaries; menstruation and ovarian function cease; in advanced lesions parametrial tissue and lymph nodes may be removed
4. Hysterectomy: removal of uterus; menstruation ceases but ovarian function continues
5. Internal or external radiation: reduce the lesion and limit metastasis; used alone or in conjunction with surgery

6. Laser therapy
7. Cryosurgery: destruction of cells by freezing
8. Conization: removal of cone-shaped area of cervix while preserving reproductive functions
9. Loop electrode excision
10. Chemotherapy (see [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders, Related Pharmacology)

## ***Nursing Care of Clients with Cancer of the Cervix***

### **Assessment/Analysis**

1. Risk factors from history
2. Description of onset and progression of clinical findings
3. Cervical specimen for Pap smear
4. Vaginal discharge following procedure; cervical interventions will produce blood-tinged discharge for 3 to 5 days

### **Planning/Implementation**

1. Assist client and family in coping with diagnosis of cancer
2. Allow and encourage client to express feelings and concerns about change in self image and sexual functioning
3. Support client's feminine image
4. Provide care for client receiving internal radiation (see [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders: Radiation and General Nursing Care of Clients with Neoplastic Disorders, common nursing interventions)
  - a. Instruct client to maintain supine position with head of bed flat or only slightly elevated
  - b. Inspect implant for proper position
  - c. Provide low-residue diet and antidiarrheal agents to prevent bowel movements; insert indwelling urinary catheter to prevent displacement of radioactive substance and irradiation of adjacent tissues
  - d. Explain need for isolation; explain to client and visitors that amount of time they can spend in the room will be limited to avoid overexposure to radiation; pregnant women and children should be restricted from visiting
  - e. Use principles of time, distance, and shielding to minimize staff exposure
  - f. Provide diversional activities for clients undergoing internal radiation
5. Provide care for client receiving chemotherapy (see [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders, Related Pharmacology)
6. Provide care following surgery
  - a. Maintain patency of urinary catheter inserted before surgery to decompress bladder and reduce stress on operative site
  - b. Monitor for reestablishment of bowel sounds

- c. Maintain accurate intake and output
- d. After removal of urinary catheter, monitor amount of output and pattern of voiding; catheterize for residual urine and whenever necessary for urinary retention if ordered
- e. See Nursing Care under Uterine Neoplasms

## Evaluation/Outcomes

1. Verbalizes feelings to family and health care providers
2. Maintains satisfying sexual expression
3. Copes with effects of treatment and potential prognosis
4. Continues health supervision

## Uterine Neoplasms

### Data Base

#### A Etiology and pathophysiology

1. Endometrial polyps
  - a. Localized overgrowths of endometrial glands and stroma that occur on cervix and in fundus of uterus; usually benign
  - b. Stimulated by estrogen
  - c. Occur more frequently in premenopausal women who are anovulatory
2. Uterine fibroids (e.g., leiomyomas, myomas, fibromas, fibromyomas)
  - a. Benign tumors of uterine muscle
  - b. Occur more frequently in African-American women and women who have not been pregnant
  - c. Stimulated by estrogen
  - d. Diminish after menopause
  - e. Rarely become malignant
3. Endometrial cancer (e.g., adenocarcinoma, adenoacanthoma, adenosquamous carcinoma)
  - a. Malignant overgrowth of uterine lining
  - b. Risk factors: hormone replacement therapy (HRT), unopposed estrogen therapy, pelvic radiation, obesity, family history
  - c. Most common malignancy of female reproductive system
  - d. Occurs more frequently with hormone imbalance, obesity, nulliparity, late menopause, dysfunctional bleeding, anovulation, uninterrupted estrogen stimulation, diabetes mellitus, early menarche
  - e. Occurs twice as often in Caucasian women than in African-American women
  - f. Spreads by direct extension or metastasis to myometrium, vagina, and paracervical tissue
  - g. Metastasizes to abdominal cavity, liver, lung, brain, bone; progression is slow and metastasis occurs late

#### B Clinical findings

1. Endometrial polyps
    - a. Frequently asymptomatic
    - b. Irregular bleeding between menstrual cycles (metrorrhagia)
  2. Leiomyomas
    - a. Frequently asymptomatic
    - b. Excessive menstrual bleeding (menorrhagia)
    - c. Signs of pressure from enlarging mass (e.g., low abdominal discomfort, backache, visceral displacement, constipation)
    - d. Painful menstruation (dysmenorrhea)
    - e. Problems with pregnancy (e.g., preterm labor, spontaneous abortion, dystocia)
  3. Endometrial cancer
    - a. Premenopausal recurrent metrorrhagia
    - b. Postmenopausal bleeding
    - c. FIGO (International Federation of Gynecology and Obstetrics) classification system of endometrial cancer extends from stage IA (tumors are limited to endometrium) to stage IVB (distant metastases to the intraabdominal area or inguinal lymph nodes)
- C Therapeutic interventions
1. Depends on type and extent of lesion or tumor, stage, and client's physical status
  2. Dilation and curettage (D&C) for polyps
  3. Myomectomy or hysterectomy for benign neoplasms; hysterectomy results in no menstrual period; when surgery is not advisable, radiation therapy is employed
  4. Total hysterectomy with bilateral salpingo-oophorectomy (panhysterectomy) for endometrial neoplasms; results in no menstrual periods and surgical menopause
  5. Intracavitary radiation may be done before or after surgery, depending on stage of endometrial cancer
  6. Hormonal therapy with progestins for endometrial cancer; HRT after panhysterectomy is controversial
  7. Combination chemotherapy with antineoplastic drugs (e.g., cyclophosphamide [Cytosan], DOXOrubicin, cisplatin [Platinol]) for endometrial neoplasms

## ***Nursing Care of Clients With a Hysterectomy***

### **Assessment/Analysis**

1. Gynecologic and health history
2. Description of onset and progression of clinical findings
3. Feelings regarding loss of uterus

### **Planning/Implementation**

1. Encourage healthy lifestyle, weight reduction if overweight, and routine pelvic examinations
2. Monitor fluid and electrolyte balance

3. Maintain patency of urinary catheter; monitor amount and characteristics of urine (blood in urine may indicate incisional tear in bladder; small voidings after catheter removal may indicate retention)
4. Encourage coughing and deep breathing at frequent intervals
5. Check for bowel sounds and gas pains; insert a rectal tube or administer a return flow enema (Harris flush) (see [Chapter 8](#), Nursing Care of Clients with Gastrointestinal System Disorders, Related Procedures, Enemas) if ordered
6. Encourage frequent ambulation and elevation of extremities when sitting to prevent thrombophlebitis; apply antiembolism stockings if ordered
7. Provide emotional support; encourage ventilation of feelings
8. Teach to postpone driving for several weeks and to avoid sexual intercourse, strenuous exercise, and heavy lifting for 6 to 8 weeks
9. Provide care for client receiving chemotherapy or radiation (see Chapter 3, Integral Aspects of Nursing Care, Neoplastic Disorders: Related Pharmacology, Radiation, and General Nursing Care of Clients with Neoplastic Disorders)
10. Emphasize importance of continuing health supervision

## Evaluation/Outcomes

1. Verbalizes concerns
2. Adjusts to loss of reproductive organs
3. Establishes bowel and bladder patterns
4. Continues health supervision

## Cancer of the Ovary

### Data Base

#### A Etiology and pathophysiology

1. Histologic cell types influenced by age
  - a. Malignant germ cell tumors more frequent between 20 and 40 years of age
  - b. Epithelial cell tumors more frequent in perimenopausal women
2. More common in Caucasian women than in African-American women; rare in Asian women
3. Incidence influenced by hormonal factors; environmental factors have been implicated but not proven
4. Risk factors: ovarian dysfunction, irregular menses, infertility, genetic predisposition (familial BRCA 1 or BRCA 2 mutations), endometriosis, early menopause, nulliparity
5. Rarely diagnosed early because abdominal cavity can accommodate an enlarging ovary without causing symptoms; poor prognosis because of advanced stage at initial diagnosis, which is usually stage II to IV
6. Metastasizes to peritoneum, omentum, bowel surfaces

#### B Clinical findings

1. Subjective: vague, lower abdominal discomfort or pain; feeling of fullness; rapid

satiation; dyspepsia; nausea

## 2. Objective

- a. Increasing abdominal girth (ovarian enlargement or ascites)
- b. Anemia, vomiting, cachexia
- c. Constipation
- d. Change in weight
- e. Urinary frequency, urgency
- f. Enlarged ovary on palpation
- g. Elevated levels of CA-125 antigen
- h. Pleural effusion

## C Therapeutic interventions

1. Depend on stage of disease
2. Surgical removal of tumor via oophorectomy, salpingo-oophorectomy, or panhysterectomy and removal of any involved structures; oophorectomy causes surgical menopause
3. Cytoreductive surgery to debulk poorly vascularized large tumors; the smaller the remaining tumor, the better the response to adjuvant therapy
4. Adjuvant therapy after tumor debulking
  - a. Chemotherapy with antineoplastic drugs (e.g., cyclophosphamide [Cytoxan], cisplatin [Platinol] DOXOrubicin) for epithelial carcinoma
  - b. Paclitaxel (Taxol) for ovarian cancer unresponsive to first-line or other therapy
  - c. Intraperitoneal instillation of radioactive phosphorus ( $^{32}\text{P}$ )
  - d. External radiation therapy

## **Nursing Care of Clients with Ovarian Cancer**

See Nursing Care under Uterine Neoplasms

See [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders: Related Pharmacology, Radiation, and General Nursing Care of Clients with Neoplastic Disorders

## **Vaginitis**

### **Data Base**

A Etiology and pathophysiology

1. Trichomoniasis: caused by *Trichomonas vaginalis*, a protozoa
2. Candidiasis (moniliasis): caused by *Candida albicans*, a fungus; incidence is high in clients with diabetes mellitus and those receiving antibiotic therapy because of decreased bacterial flora
3. Bacterial vaginosis: caused by overgrowth of vaginal flora
4. Atrophic vaginitis: common in postmenopausal period
5. Contributing factors: oral contraceptive use, sexually transmitted infections (e.g., gonorrhea, HIV), allergic reactions

## B Clinical findings

1. Subjective: pruritus, burning, dysuria, dyspareunia (pain with intercourse)
2. Objective
  - a. Vaginal discharge
    - (1) Malodorous, thin, yellow discharge (trichomoniasis)
    - (2) White “cheesy” discharge (moniliasis)
    - (3) Grayish-white discharge; malodorous (bacterial vaginosis)
  - b. Vaginal smear may indicate *T. vaginalis*, *C. albicans*, or other microorganisms

## C Therapeutic interventions

1. Antifungals for candidiasis (e.g., terconazole [Terazol], over-the-counter (OTC) antifungal creams)
2. Antiprotozoans for trichomoniasis (e.g., metronidazole [Flagyl] tablets taken orally; clotrimazole cream inserted vaginally)
3. Antimicrobials for bacterial vaginosis (e.g., clindamycin [Cleocin] cream or oral administration, metronidazole [Flagyl] cream or tablets, ceftriaxone [Rocephin])
4. Estrogen therapy for atrophic vaginitis

## **Nursing Care of Clients with Vaginitis**

### **Assessment/Analysis**

1. History of onset and progression of clinical findings
2. Risk factors: improper use of tampons or douches, antibiotic use, multiple sexual partners, diabetes mellitus, HIV
3. Characteristics of vaginal discharge
4. Pelvic examination and specimen for culture

### **Planning/Implementation**

1. Advise condom use during coitus until vaginitis is resolved; sexual partner may require treatment
2. Advise that douching is not recommended unless prescribed by health care provider; teach to lie in recumbent position on bedpan and direct douche nozzle toward sacrum if douche is prescribed
3. Encourage warm sitz baths to relieve perineal discomfort (sodium bicarbonate added to water may be ordered)
4. Teach importance of wearing loose-fitting clothing and cotton underwear, and to avoid wearing pantyhose, “thong” underpants, and tight pants; avoid using tampons
5. Instruct when receiving antibiotics or having recurrent vaginal infections to include yogurt or supplements containing *Lactobacillus acidophilus* in diet to maintain vaginal flora

### **Evaluation/Outcomes**

1. Expresses relief from pruritus and pain

2. Discusses need for diagnostic screening and precautions with sexual partner
3. Achieves resolution of infection

# Endometriosis

## **Data Base**

### A Etiology and pathophysiology

1. Growth of endometrial tissue in areas outside uterus (e.g., ovaries, ligaments, abdominal organs)
2. May be linked to retrograde menstruation or vascular and lymphatic system dissemination of endometrial tissue outside of uterus
3. Generally affects young, nulliparous women; unrelated to menopause
4. Endometrial cells stimulated by ovarian hormones; causes bleeding during regular menstrual cycle, and if located in ovary, pseudocyst or chocolate cyst may form; endometriosis is suppressed by pregnancy and lactation
5. Adhesions are common and may result in sterility and pain
6. Adenomyosis is a similar condition affecting women 40 to 50 years old in which endometrial cells invade muscles of uterus

### B Clinical findings

1. Subjective
  - a. Chronic lower abdominal pain and backache beginning 2 to 7 days before menstruation, becoming progressively worse, and then diminishing as menstrual flow decreases
  - b. Dyspareunia
  - c. Pain associated with defecation
2. Objective
  - a. Abnormal uterine bleeding (e.g., metrorrhagia, menorrhagia)
  - b. Infertility

### C Therapeutic interventions

1. Hormone therapy to suppress ovulation; young married women are advised not to delay pregnancy if children are desired; breastfeeding delays return of symptoms
  - a. Oral contraceptives and/or progesterone to cause tissue sloughing
  - b. Synthetic analog of gonadotropin-releasing hormone to reduce lesions (e.g., leuprolide [Lupron Depot] administered intramuscularly [IM], subcutaneously [Sub Q], or via implant; nafarelin [Synarel] may be administered intranasally)
  - c. Gonadotropin inhibitors (e.g., danazol)
2. Surgical interventions
  - a. Laparoscopic evaluation to confirm diagnosis
  - b. Resection of lesions; laser treatment
  - c. Oophorectomy, salpingectomy, or total hysterectomy if condition is severe and childbearing is not an issue
3. Laser ablation

# ***Nursing Care of Clients with Endometriosis***

## **Assessment/Analysis**

1. Description of onset and progression of clinical findings
2. Pelvic examination
3. Concerns about childbearing

## **Planning/Implementation**

1. Encourage ventilation of feelings
2. Administer analgesics if prescribed
3. Review administration of prescribed hormones, contraindications, and side effects (see [Chapter 23](#), Nursing Care to Promote Childbearing and Women's Health, Related Pharmacology)
4. Discuss alternatives if pregnancy does not occur
5. Provide care following surgery (see Nursing Care Uterine Neoplasms)
6. Provide referrals to Endometriosis Society and other community-based support groups

## **Evaluation/Outcomes**

1. Experiences relief from pain
2. Verbalizes concerns about altered body image and infertility

# **Toxic Shock Syndrome**

## ***Data Base***

A Etiology and pathophysiology

1. Caused by *Staphylococcus aureus*, less frequently streptococcus
2. Risk factors: tampon, cervical cap, and diaphragm left in place for extended period

B Clinical findings

1. Subjective: dizziness (early), altered level of consciousness, disorientation
2. Objective: fever, rash on trunk, hypotension, vomiting, diarrhea, positive cultures, abnormal laboratory test results based on multiple organ failure

C Therapeutic interventions

1. Antibiotic therapy (e.g., penicillin, clindamycin [Cleocin])
2. Fluid replacement
3. Circulatory support (e.g., vasopressors)
4. Support for multiple organ failure (e.g., ventilator, dialysis)
5. Decontamination and débridement as needed

## ***Nursing Care of Clients with Toxic Shock Syndrome***

Nursing care is based on the degree of illness and prescribed therapeutic interventions (see Nursing Care under Pelvic Inflammatory Disease). If the client develops septic shock, see [Chapter 6](#) Shock, Nursing Care. If the client requires mechanical ventilation

see [Chapter 7](#), Related Procedures, Mechanical Ventilation.

# Pelvic Inflammatory Disease (PID)

## **Data Base**

### A Etiology and pathophysiology

1. Occurs within female pelvic cavity: can affect uterus (endometritis), fallopian tubes (salpingitis), ovaries (oophoritis), peritoneum, surrounding connective tissue, pelvic veins
2. May be acute, subacute, or chronic; bilateral or unilateral
3. Caused most often (50%) by introduction of bacteria (e.g., gonococci, chlamydia) through cervical opening
4. If untreated, can lead to adhesions, sterility, ectopic pregnancy, peritonitis
5. Risk factors: multiple sex partners, history of sexually transmitted infections, intrauterine device (IUD) insertion, douching, sexual activity during menses, nulliparity

### B Clinical findings

1. Subjective: pain ranging from dull aching to severe cramping in lower abdomen, nausea, malaise, dysmenorrhea, dyspareunia
2. Objective
  - a. Elevated temperature, increased white blood cell (WBC) count
  - b. Foul-smelling, purulent vaginal discharge
  - c. Cultures of vaginal discharge reveal causative organism

### C Therapeutic interventions

1. Medication to control pain and fever
2. Antibiotics depending on organism
3. Identification and notification of sexual contacts and state health departments if sexually transmitted infection is present

## **Nursing Care of Clients with Pelvic Inflammatory Disease**

### **Assessment/Analysis**

1. Description of onset and progression of clinical findings
2. Potential source of infection
3. Pelvic examination and specimens for culture
4. Characteristics of discharge
5. Vital signs and WBC count for baseline data

### **Planning/Implementation**

1. Monitor temperature, WBC count, culture reports
2. Explain importance of completing prescribed antibiotic therapy; teach side effects; follow-up after treatment to assess response to therapy

3. Maintain bed rest in Fowler or semi-Fowler position to localize infection and prevent formation of abscesses within abdominal cavity
4. Observe and record amount and characteristics of vaginal discharge
5. Change perineal pads frequently using gloves
6. Teach safety measures to prevent reinfection of client or others: abstention from intercourse, avoidance of using tampons during treatment
7. Encourage verbalization of feelings about illness and/or possible complication of infertility
8. Explain importance of prenatal care if pregnancy occurs
9. Teach signs of ectopic pregnancy because of increased risk

## **Evaluation/Outcomes**

1. Expresses relief from pain
2. Discusses need for diagnostic screening and precautions with sexual partner
3. Achieves resolution of infection
4. Verbalizes concerns
5. Verbalizes knowledge of the disease, its prevention, and its consequences

## **Prolapsed Uterus**

### ***Data Base***

#### **A Etiology and pathophysiology**

1. Abnormal position of uterus as a result of pelvic floor weakness
  - a. First degree: uterus descends into vagina
  - b. Second degree: cervix is at or near outside vaginal orifice
  - c. Third degree: entire uterus inverts and protrudes outside vaginal orifice (procidentia)
2. Ulcerations in procidentia increase risk for cancer

#### **B Clinical findings**

1. Subjective: heaviness within pelvis, low back pain
2. Objective
  - a. Mass in lower vagina or outside orifice
  - b. Elongated cervix
  - c. Urinary retention and/or incontinence

#### **C Therapeutic interventions**

1. Vaginal pessary to maintain uterus in correct position
2. Surgical intervention
  - a. Suspension of uterus and correction of retroversion
  - b. Pelvic surgery to resuspend uterus and resupport musculature
  - c. Vaginal hysterectomy (if postmenopausal or if future pregnancy is not desired)

### ***Nursing Care of Clients with a Prolapsed Uterus***

## Assessment/Analysis

1. Description of onset and progression of clinical findings
2. Pelvic examination: identify degree of prolapse, presence of cystocele or rectocele
3. Interference with urinary and bowel elimination
4. Presence of ulcerations on skin or mucous membranes

## Planning/Implementation

1. Observe for ulcerations if procidentia is present; apply warm saline compresses or protective ointment as prescribed to prevent ulceration
2. Explain a pessary must be taken out and cleaned periodically if used
3. Monitor color, amount, and frequency of urination; teach pelvic floor exercises (Kegel)
4. Monitor consistency, amount, and frequency of bowel movements
5. Provide postoperative care (see Nursing Care under Cancer of the Cervix)

## Evaluation/Outcomes

1. Maintains integrity of skin and mucous membranes
2. Establishes a regular pattern of bowel elimination
3. Establishes a regular pattern of urinary elimination
4. Reestablishes a satisfying sexual relationship

## Cystocele and/or Rectocele

### Data Base

#### A Etiology and pathophysiology

1. Cystocele: herniation of bladder into vagina
2. Rectocele: herniation of rectum into vagina
3. Both conditions may be present at same time and are associated with relaxation or injury of pelvic muscles during childbirth
4. Fistulas may occur
  - a. Rectovaginal: opening between rectum and vagina
  - b. Vesicovaginal: opening between bladder and vagina
  - c. Urethrovaginal: opening between urethra and vagina

#### B Clinical findings

1. Subjective: feeling of fullness in vagina, lower abdomen, and/or back; constant urge to urinate or defecate; dysuria
2. Objective
  - a. Soft, reducible mass evident during vaginal examination that increases when bearing down
  - b. Stress incontinence, frequency; urgency
  - c. Residual urine (60 mL or more after voiding)
  - d. Constipation or diarrhea

#### C Therapeutic interventions

1. Anterior colporrhaphy: corrects cystocele
2. Posterior colporrhaphy: corrects rectocele
3. Insertion of pessary for mild symptoms

## ***Nursing Care of Clients with a Cystocele and/or Rectocele***

### **Assessment/Analysis**

1. History of prolapsed uterus
2. Description of onset and progression of clinical findings
3. Pelvic examination
4. Presence and extent of urinary retention
5. Impact of symptoms on lifestyle

### **Planning/Implementation**

1. Teach care related to use of pessary (e.g., cleaning, removing, or having it removed periodically)
2. Encourage to perform Kegel exercises regularly to strengthen perineal muscles and use knee-chest position for a few minutes several times daily
3. Instruct to prevent constipation (e.g., high-fiber diet, fluids, exercise, stool softeners as prescribed)
4. Encourage to verbalize feelings and to ask questions
5. Provide postoperative care
  - a. Maintain patency of urinary catheter to prevent retention; when catheter is removed assess for signs of retention
  - b. Encourage voiding every 4 hours to prevent strain on suture line from distended bladder; perform residual urine measurements as ordered (no more than 150 mL should accumulate)
  - c. Cleanse perineum with warm soap and water and flush with warm water using a peri-bottle after each bowel movement and voiding; cleanse away from vagina and toward anus; sitz baths may be used
  - d. Apply anesthetic spray or ice packs if ordered to relieve discomfort
  - e. Administer prescribed stool softeners to limit straining at stool and pressure on suture line
  - f. Encourage intake of liquids on first postoperative day and regular diet on second day

### **Evaluation/Outcomes**

1. Establishes a regular pattern of bowel elimination
2. Remains free from episodes of urinary incontinence

## **Benign Breast Disease**

### ***Data Base***

## A Etiology and pathophysiology

1. Fibrocystic breast condition: fluid-filled cysts and/or areas of thickening; may feel soft or hard on palpation; pain is common; linked to hormonal imbalance and caffeine consumption
2. Fibroadenomas: encapsulated, nontender tumors; increase in size during pregnancy and decrease with age; most common benign breast condition during reproductive years
3. Papillomas: intraductal lesions within terminal duct; may cause bloody or serous nipple discharge; occur in women between 40 and 55 years; multiple growths may be cancerous
4. Ductal ectasia: inflammatory response caused by blockage of ducts in subareolar area; duct is palpable and tender; greenish brown nipple discharge; occurs in perimenopausal or postmenopausal women; not generally associated with cancer
5. Lipomas: soft, fatty tumors that are mobile and nontender

## B Clinical findings

1. Subjective: painful, tender breasts (mastalgia)
2. Objective
  - a. Palpable lesions that may be hard or soft, painful or nontender, fixed or mobile
  - b. Nipple discharge may be bloody with papilloma, or greenish brown with ductal ectasia
3. Sonography and/or mammography to identify location and shape of lesion
4. Biopsy to determine pathology of lesion

## C Therapeutic interventions

1. Interventions depend on extent of disorder
2. Aspiration of cysts for cytology studies; biopsies with suspicious findings
3. Diagnostic imaging studies and breast self-examination on a regular basis
4. Dietary modification to decrease intake of caffeine and fat

## ***Nursing Care of Clients with Benign Breast Disease***

### **Assessment/Analysis**

1. Breast-oriented history (e.g., menstrual history, previous imaging study results, biopsies, cyst aspirations, hormone therapy, breast cancer)
2. Breast examination

### **Planning/Implementation**

1. Instruct regarding importance of regular breast self-examination, yearly clinical breast examination, sonography/mammography studies
2. Explain importance of dietary restrictions of caffeine and fat
3. Explore concerns regarding fear of findings; do not minimize concerns

### **Evaluation/Outcomes**

1. Discusses feelings and concerns with health team members
2. Expresses decreased pain in breasts
3. Continues planned follow-up with yearly clinical breast examination and diagnostic imaging studies

## Cancer of the Breast

### **Data Base**

#### A Etiology and pathophysiology

1. Hard, nontender, fixed nodule; most often adenocarcinomas originating in ducts and lobes
2. Incidence: increasing age, estrogen replacement therapy for more than 10 years, increased number of menstrual cycles (menarche before age 12, menopause after age 55), nulliparity or parity after age 35, postmenopausal obesity, presence of *BRCA* gene mutations; history of benign breast disease, unrelated cancer, first-degree relative with breast cancer
3. Sites of metastasis: bone, bone marrow, soft tissue, lungs, liver, brain
4. Nodal involvement most important prognostic factor
5. Tumors may be estrogen- or progesterone-receptor positive

#### B Clinical findings

1. Subjective: painless in early stages; malaise in later stages
2. Objective
  - a. Palpable, irregularly shaped, fixed mass; most often in upper, outer quadrant
  - b. Breast changes
    - (1) Asymmetry of breasts
    - (2) Nipple inversion and discharge
    - (3) Skin: dimpling and change of color over lesion; orange peel (peau d'orange) appearance in late stages
  - c. Enlarged axillary lymph nodes
  - d. Diagnostic tests
    - (1) Mammography: baseline between ages 35 and 40; every 1-2 years after age 40 based on risk factors
    - (2) Sonography (for dense breast tissue); thermography; transillumination (for early detection); magnetic resonance imaging (MRI)
    - (3) Biopsy for cytologic evaluation (see [Chapter 23](#), Nursing Care to Promote Childbearing and Women's Health, Related Procedures)
    - (4) Estrogen receptor assay: positive result indicates need for alteration of hormonal environment by surgical or chemical means
    - (5) Tumor markers: CA-15-3 and CA-125; carcinoembryonic antigen (CEA) in serum, plasma, or cerebrospinal fluid; indicative of progression of cancer, particularly of breast, ovaries, gastrointestinal tract

#### C Therapeutic interventions

1. Intervention depends on extent of primary tumor, regional lymph node involvement,

extent of distant metastases (TNM classification); physical status

## 2. Surgical intervention

- a. Sentinel node biopsy or lymphectomy to determine status of regional lymph node involvement, risk for metastasis
- b. Partial mastectomy (lumpectomy, wide excision, segmental resection, or quadrantectomy): removal of lump and surrounding breast tissue
- c. Simple mastectomy: removal of breast
- d. Modified radical mastectomy: similar to radical mastectomy but pectoral muscles not removed
- e. Radical mastectomy: removal of breast, pectoral muscles, pectoral fascia, nodes (pectoral, subclavicular, apical, axillary); rarely performed
- f. Breast reconstruction (tissue expanders, saline implants, muscle flaps)
- g. Oophorectomy, adrenalectomy, and/or hypophysectomy to control metastases by altering endocrine environment

## 3. Radiation therapy through external beam or interstitial implant using iridium 192 ( $^{192}\text{Ir}$ ) (see [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders: Radiation and General Nursing Care of Clients with Neoplastic Disorders)

## 4. Chemotherapy

- a. Alkylating agent: cyclophosphamide (Cytosan)
- b. Antimetabolites: fluorouracil, methotrexate
- c. Antitumor antibiotic: DOXOrubicin
- d. Taxanes: paclitaxel, docetaxel (Taxotere); interfere with cellular microtubule function
- e. Hormonal therapy: anastrozole (Arimidex), letrozole (Femara), tamoxifen, toremifene (Fareston), fulvestrant (Faslodex); reduces DNA and estrogen response
- f. Corticosteroid: predniSONE

## 5. Biologic therapy: trastuzumab (Herceptin)

## 6. Bone marrow/stem cell transplantation

# ***Nursing Care of Clients with Cancer of the Breast***

## **Assessment/Analysis**

1. Personal/family history of breast cancer
2. Ages at menarche, menopause, birth of first child
3. Regularity of breast self-examinations, clinical breast examinations, mammograms
4. Characteristics of lesion, skin surface, lymph nodes
5. Fears concerning consequences of cancer diagnosis, sexuality, finding another mass
6. Coping skills; use of support system

## **Planning/Implementation**

1. Teach monthly breast self-examination
  - a. Perform 7 days after start of menstruation or same time every month if

postmenopausal

- b. Inspect while standing with hands at sides, overhead, and then on hips for asymmetry, retraction of nipple, dimpling of skin, color change
- c. Palpate axillary and supraclavicular nodes
- d. Palpate breast tissue using a systematic pattern (e.g., circles, vertical lines, wedges) when standing and lying down with arm abducted ([Figure 24-1](#): Breast self-examination)

**FIGURE 24-1** Breast self-examination. **A**, Circles. **B**, vertical lines. **C**, wedges. (From Lowdermilk DL, Perry SE: *Maternity and women's health care*, ed 9, St. Louis, 2007, Mosby.)

- e. Squeeze nipple of each breast to check for discharge
- 2. Provide emotional support
  - a. Assist to cope with diagnosis, altered body image
  - b. Encourage ventilation of feelings
  - c. Listen to and accept feelings
- 3. Care after mastectomy
  - a. Observe for hemorrhage: check all areas of dressing, underneath client, drainage unit, vital signs
  - b. Maintain functioning of portable wound drainage system: ensure patency of tube, empty before half full, avoid tension at insertion site (drainage should not exceed 200 mL in 8 hours)
  - c. Encourage coughing, deep breathing, use of incentive spirometer
  - d. Assist with ambulation until adjusted to altered balance; encourage correct posture
  - e. Prevent or reduce lymphedema: elevate and support lower arm above elbow with elbow above shoulder; inflatable or elastic sleeve may be ordered
  - f. Protect affected arm (e.g., instruct to avoid carrying heavy articles, having blood drawn, injections, blood pressure readings)
  - g. Encourage exercising affected arm (e.g., squeezing a ball, brushing hair, wall hand-climbing, turning rope); begin gradually as ordered, usually day after surgery
  - h. Instruct about types of prostheses and where to obtain them; cotton covered by gauze

may be used to fill bra until ready for professional fitter

- i. Explore feelings about breast reconstruction surgery
- j. Refer to programs (e.g., Reach for Recovery) for physical and emotional readjustment
- 4. Encourage intake of low fat foods and foods rich in immune-stimulating substances (e.g., vitamins A, C, and E, and mineral selenium)
- 5. Provide care related to chemotherapy and radiation (see [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders, General Nursing Care of Clients with Neoplastic Disorders)

## Evaluation/Outcomes

- 1. Expresses acceptance of body image
- 2. Identifies precautions necessary to prevent injury to arm on affected side
- 3. Maintains strength and mobility of arm on affected side
- 4. Discusses feelings with health care providers, family, sexual partner
- 5. Demonstrates and continues to perform monthly breast self-examination

## Osteoporosis

### **Data Base**

#### A Etiology and pathophysiology

- 1. Systemic skeletal disorder
  - a. Microarchitectural deterioration of bone tissue; loss of bone mineralization, diminished bone mass
  - b. Resulting bone fragility predisposes to pathologic fractures; most commonly affects vertebrae, pelvis, head of femur
- 2. Risk factors: heredity (60% to 80%); low body weight (less than 127 lb); prolonged premenopausal amenorrhea; early menopause; sedentary lifestyle; prolonged immobility; inadequate intake of dietary calcium; low serum vitamin D levels; smoking; alcohol use; long-term steroid therapy

#### B Clinical findings

- 1. Subjective: back pain that increases with activity and decreases with rest; difficulty maintaining balance
- 2. Objective
  - a. Decreased height resulting from compression of vertebrae; kyphosis
  - b. Bone mass measurements (e.g., x-ray examinations, dual-energy densitometry [absorptiometry])
  - c. Pathologic fractures

#### C Therapeutic interventions

- 1. Planned program of weight-bearing exercise to increase calcium deposition in bone
- 2. Hormone replacement therapy (HRT) with estrogen to decrease bone reabsorption; HRT is controversial because of relationship to increased evidence of breast cancer and cardiovascular disorders

3. Bisphosphate therapy: inhibit osteoclasts and reduce bone resorption; alendronate (Fosamax), risedronate (Actonel)
4. Human recombinant parathyroid hormone: to stimulate new bone growth; (e.g., teriparatide (Forteo))
5. High-protein, high-calcium diet; calcium and vitamin D supplements
6. Spine support (e.g., corset, Philadelphia collar, Taylor brace)
7. Treatment of modifiable risk factors

## ***Nursing Care of Clients with Osteoporosis***

### **Assessment/Analysis**

1. Factors contributing to development of osteoporosis
2. Dietary pattern, use of OTC medications
3. History of loss of balance, falls, pain, fractures

### **Planning/Implementation**

1. Encourage active weight-bearing and range-of-motion exercises
2. Teach effective body mechanics
3. Encourage use of assistive devices (e.g., walker, cane) to promote stability
4. Encourage diet that supplies substances needed for mineralization of bone (e.g., vitamins A, C, and D; calcium; magnesium; phosphorus); discuss calcium and vitamin D supplements
5. Advise to limit intake of sodium, caffeine, and alcohol because they increase calcium excretion
6. Encourage use of orthotic devices if ordered

### **Evaluation/Outcomes**

1. Reports reduction in pain
2. Complies with dietary and drug regimens
3. Participates in weight-bearing exercises
4. Maintains physical mobility
5. Remains free from injury

# CHAPTER 25

# **Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period**

---

# Prenatal Period

## Data Base

### *Development of the Embryo/Fetus*

A Formation of gametes: ovum and spermatozoon are formed by meiosis; each have one set of 23 chromosomes; other body cells have two sets (46 chromosomes, 23 pairs)

B Chromosomes: carry sets of matching genes (alleles); one may be dominant, the other recessive, or have blending expressions

C Sex determination in humans

1. Females have two X chromosomes; males have one X and one Y chromosome
2. Ovum has one X chromosome; sperm have either an X or a Y chromosome
3. X-bearing sperm that fertilizes an ovum results in a female; Y-bearing sperm that fertilizes an ovum results in a male

D Genes

1. Sex-linked genes: carried on X chromosome are always expressed in the male, even if recessive (e.g., hemophilia, color blindness)
2. Multiple genes: may combine to produce cumulative effects (e.g., degree of pigmentation, height)
3. Multiple alleles: influence human traits (e.g., blood types, eye color)

E Chromosomal alterations

1. Additional sex chromosomes produce individuals with genetic abnormalities (e.g., Turner syndrome; Klinefelter syndrome)
2. Translocation of chromosomes (e.g., trisomy 21 [Down syndrome])
3. Mutations
  - a. Changes in DNA; chromosomal changes
  - b. Risk factors: ultraviolet radiation, x-rays, radioactive radiation, chemical substances

F Fertilization

1. Occurs about 24 hours after ovulation when sperm enters ovum
2. Zygote forms; chromosome number restored to two sets (46 chromosomes)

G Cleavage: rapid mitotic division of zygote produces morula that divides to form blastocyst

H Implantation: blastocyst implants in uterine wall 7 to 8 days after fertilization

I Placenta

1. Dual origin: maternal and embryonic
2. Structures
  - a. Chorion: becomes major part of placenta; forms chorionic villi (fingerlike projections growing into uterine endometrium)
  - b. Amnion sac: surrounds embryo; contains amniotic fluid at 46 to 48 days gestation
3. Functions
  - a. Site for interchange of food, gases, and wastes between mother and embryo/fetus

- b. Produces estrogens, progesterone, adrenocorticotrophic hormone [ACTH], human chorionic gonadotropin [hCG], and human placental lactogen [hPL])
- c. Protective barrier against harmful effects of some drugs and microorganisms

## J Umbilical cord

1. Location: in central portion of placenta; attached to fetus
2. Structures and functions
  - a. One vein transports maternal nourishment from placenta to fetus; two arteries transport fetal wastes to placenta
  - b. Wharton jelly: protective covering surrounding cord

## K Embryonic development

1. Conceptus: embryo during first 2 months; fetus thereafter
2. First 8 weeks: organogenesis (rapid growth and development of organs); interference can cause irreparable fetal damage; preconception counseling includes avoidance of alcohol, tobacco, illegal, and over-the-counter drugs
3. At 14 days: heart begins to beat; brain, early spinal cord, and muscle segments present
4. At 30 days: embryo  $\frac{1}{4}$  to  $\frac{1}{2}$  inch (0.6 to 1.2 cm) in length, definite form, umbilical cord becomes visible
5. At 31 to 36 days: both arms and legs have digits but may be webbed; 46 to 48 days: cartilage in upper arms replaced by first bone cells
6. End of 8 weeks: organ systems and external structures are recognizable

## L Fetal development

1. At 9 weeks: genitalia begin to differentiate; fully differentiated by 12 weeks
2. At 12 weeks: moves, swallows, respiratory movements present; weighs 28 g (1 oz); fetal heart audible with Doptone (fetal heart rate (FHR) 110 to 160 beats/min); chorionic villi sampling at 10 to 12 weeks
3. At 16 to 20 weeks: fetal movements felt by mother (quickening); weighs 170 g (6 oz); 20 to 25 cm (8 to 10 inches) in length; 200 mL of amniotic fluid enables amniocentesis at 14 to 16 weeks; vernix and lanugo cover and protect fetus
4. At 20 to 24 weeks: hair growth on head, eyelashes, and brow; skeleton hardens; eyelids closed; weighs 0.45 kg (1 lb); 30.5 cm (12 inches) in length; respiratory movements become more regular
5. At 24 to 28 weeks: eyelids open; amniotic fluid increases; weighs 0.5 kg ( $1\frac{1}{4}$  lb); alveolar cells of lungs produce pulmonary surfactants that minimize surface tension
6. At 28 to 32 weeks: brown fat begins to deposit; weighs 0.5 to 0.7 kg (1 to  $1\frac{1}{2}$  lb)
7. At 32 to 36 weeks: stores protein for extrauterine life; gains 1.8 kg (4 lb)
8. At 36 to 40 weeks: lanugo disappears; vernix present, particularly in creases; nails extend; visible mammary glands; testes palpable in scrotum; weighs 3 to 3.6 kg (6 lb 10 oz to 7 lb 15 oz) but varies; full-term birth is 38 to 40 weeks
9. Fetal circulation: contains mixed blood with low oxygenation; 30% to 70% oxygen saturation
  - a. Foramen ovale: opening between right and left atria, bypasses fetal lungs
  - b. Ductus arteriosus: connection between pulmonary trunk and aorta, bypasses fetal lungs

- c. Ductus venosus: connection between umbilical vein and ascending vena cava, bypasses fetal liver

## ***Physical, Physiologic, and Emotional Changes during Pregnancy***

### A Affirmation and confirmation of pregnancy

1. Presumptive signs: subjective (may be indicative of illness); amenorrhea; fatigue; nausea and vomiting; breast changes; urinary frequency; darkening of pigmentation on face, breasts, and abdomen; quickening (feeling of movement at about 16 to 20 weeks)
2. Probable signs: objective but not definite confirmation
  - a. Uterine changes: uterine enlargement; Hegar sign (lower uterine segment softens), Goodell sign (cervix softens)
  - b. Vaginal change: Chadwick sign (color becomes purplish)
  - c. Fetal outline; ballottement
  - d. Pregnancy tests: urine and blood detects human chorionic gonadotropin (hCG)
  - e. Preparatory contractions (formerly called Braxton Hicks)
3. Positive signs: confirmation
  - a. Fetal heartbeat: heard with fetoscope, Doppler
  - b. Fetal outline and movement: felt by examiner
  - c. Ultrasonography: visualization of fetus and movement of fetal heart
4. Identification of singleton or multiple gestation (early determination vital because multiple gestation contributes to perinatal morbidity and mortality)
5. Estimating date of birth (EDB) and duration of pregnancy
  - a. Nägele rule: count back 3 months from first day of last menstrual period and add 7 days and 1 year
  - b. Fundal height: measurement from symphysis pubis to top of fundus; fundus rises about 1 cm per week up to 30 weeks; 20 weeks at umbilicus (McDonald rule), 36 weeks at xiphoid process
  - c. Ultrasonography: up to 11 weeks gestational age established by crown to rump measurement (must have full bladder to move uterus into abdominal cavity for visualization; instructed to drink quart of fluid before test); 11 weeks head measurements (biparietal diameter is 9.8 cm or more at term)

### B Emotional changes

1. Ambivalence about pregnancy, parenting, impact on family
2. Mood swings
3. Sexual desire may increase or decrease
4. First trimester: acceptance of biologic fact of pregnancy; acquires knowledge regarding physical, physiologic, and emotional changes of pregnancy
5. Second trimester: acceptance of growing fetus as distinct from self
6. Third trimester: preparation for birth; anxiety related to birth, newborn's health, additional responsibilities

### C Endocrine

1. Hormones secreted by placenta
  - a. Human chorionic gonadotropin (hCG): confirms pregnancy; maintains pregnancy;

continues secretion of progesterone and estrogen from corpus luteum during first trimester; causes morning sickness; peaks at end of first trimester, then drops; high levels associated with hydatidiform mole

- b. Estrogen: secreted during last two trimesters; promotes vasodilation; softens cervix; helps prepare breasts for lactation; causes sodium and water retention; increased estriol levels in maternal saliva may indicate preterm labor
- c. Progesterone: inhibits uterine contractions; promotes smooth muscle relaxation, causing decreased GI motility and increased bladder capacity; promotes sodium loss
- d. Human placental lactogen (hPL) or human chorionic somatomammotropin (hCS): diabetogenic (diminished insulin efficiency); decreases maternal utilization of glucose, providing more glucose for fetal growth; affects lipid and protein metabolism; helps prepare breasts for lactation

2. Thyroid: increased secretion may mimic mild hyperthyroidism

3. Parathyroids: increased secretion affects calcium metabolism

4. Adrenal cortex

- a. Cortisol: promotes carbohydrate, protein, and fat metabolism; activates gluconeogenesis to produce glucose for more energy
- b. Aldosterone: production increases; rennin and angiotensin II levels rise; protects against excessive sodium loss

5. Pituitary

- a. Anterior: enlarges; ovulatory hormones are suppressed; prolactin secreted to help prepare breasts for lactation
- b. Posterior: releases oxytocin, which stimulates uterine contractions that initiate labor; after birth, contracts uterus and stimulates milk ejection reflex

6. Pancreas: increases insulin production early in pregnancy

D Reproductive

1. Ovaries: ovulation inhibited by high levels of circulating estrogen and progesterone secreted by corpus luteum

2. Uterus: circulatory, hormonal, and other changes related to fetal growth; amenorrhea resulting from continuation of corpus luteum; enlarges from 70 g to 1000 g; rises from pelvis to abdomen after first trimester; Hegar sign; Goodell sign

3. Vagina: leukorrhea from uterus; Chadwick sign; acidity increases

4. Breasts: fullness, tingling, soreness, darkened areolae, and nipples

E Gastrointestinal

1. Nausea and vomiting (morning sickness) during first trimester; related to human chorionic gonadotropin (hCG) hormone

2. Excessive salivation (ptyalism)

3. Gingivitis; caused by hyperemia and softening of gums; hyperacidity of oral secretions; increased vitamin C intake and regular oral hygiene relieve problem

4. Gallbladder; emptying time decreases; may precipitate gallstone formation

5. Development of food cravings; unusual cravings for clay, starch, dirt (pica); may be harmful

6. Heartburn (pyrosis): caused by delayed emptying time of stomach, reflux of gastric acid contents into esophagus, gastric irritants (e.g., coffee, tea, chocolate)
7. Hiatus hernia: risk in older, obese women or if carrying multiple fetuses
8. Constipation: caused by decreased GI motility, low fluid intake, low fiber intake, pressure of enlarged uterus on internal organs; straining on defecation may contribute to development of hemorrhoids

#### F Urinary

1. Frequency: caused by weight of uterus on bladder in early and late pregnancy
2. Increased bladder capacity: smooth muscle relaxation reduces bladder tone, increases capacity to 1500 mL
3. Dilation of renal pelvises and ureters: caused by pressure of enlarging uterus; right ureter displaced more than left
4. Flow rate: decreased, leading to retention, stasis, risk for infection
5. Lowered renal threshold: caused by glycosuria; occasional mild proteinuria

#### G Circulatory

1. Blood volume: increased to meet needs of woman and fetus
2. Physiologic anemia: caused by hemodilution; blood volume increases 45% to 50% with ratio of 75% plasma and 25% RBCs; imbalance between plasma and RBCs reduces hematocrit and hemoglobin; anemia diagnosed when hemoglobin is less than 11 g/dL
3. Cardiac output: increases 30% to 50%, peaking at 28 to 32 weeks
4. Heart rate: increases 10 to 15 beats/min in latter half of pregnancy; palpitations in early months from sympathetic nervous stimulation, in later months from increased thoracic pressure caused by enlarged uterus
5. Blood pressure
  - a. Slight decrease in second trimester
  - b. Supine hypotension (vena caval syndrome): weight of enlarged uterus compresses vena cava; blood return to heart decreases; cardiac output decreases causing lightheadedness, faintness, and palpitations ([Figure 25-1: Supine hypotension](#))

**FIGURE 25-1** Supine hypotension. (From Lowdermilk DL, Perry SE, Cashion MC: *Maternity nursing*, ed 8, St. Louis, 2011, Mosby.)

6. Blood components: increased WBCs (from 5000/mm<sup>3</sup> to 12,000/mm<sup>3</sup>), fibrinogen, and other clotting factors increase
7. Pelvic hyperemia and pressure of uterus on pelvic blood vessels: can cause varicose veins of legs, vulva, and perianal area
8. Peripheral edema in last 6 weeks: caused by venous stasis
9. Thrombophlebitis: heparin or low-molecular-weight heparin (enoxaparin [Lovenox])

may be administered because they do not cross placental barrier; bed rest with leg elevation prescribed

## H Respiratory

1. Oxygen consumption: increases by about 15% between 16th and 40th weeks; slight increase in vital capacity; thoracic cavity expands up to 40%, tidal volume increases causing the thoracic cavity to expand by 40%
2. Hyperventilation: caused by need to blow off increased carbon dioxide transferred from fetus
3. Nasal congestion and epistaxis: response to increased estrogen levels
4. Third trimester: pressure of enlarged uterus on diaphragm and lungs may cause dyspnea; subsides with lightening at about 38 weeks

## I Integumentary

1. Diaphoresis: caused by excretion of wastes through skin
2. Skin changes: increased melanin causes darkening of areolae, dark patches on face (melasma, formerly chloasma), linea nigra on abdomen; striae on abdomen and legs caused by skin stretching as pregnancy advances; erythematous changes on palms and face in some women

## J Skeletal

1. Ligaments and joints: soften, especially symphysis pubis and sacroiliac joint; caused by increased hormonal action of estrogens and relaxin
2. Leg cramps: caused by imbalance of calcium (hypocalcemia), pressure of gravid uterus on nerves supplying lower extremities, decrease in dietary calcium

## K Nutritional needs during pregnancy

1. Increased calories: meets increased basal metabolic needs (300 additional calories during second and third trimesters); spares protein for growth, promotes weight gain to support pregnancy
2. Weight gain
  - a. Gain of 14.4 to 16 kg (25 to 35 lb); about 4 lb every month after initial 3- to 4-lb gain in first trimester
  - b. Underweight gain more, overweight gain less; if carrying multiple fetuses gain more than recommended for one fetus
  - c. Body mass index: helps to individualize appropriate weight gain
3. Increased nutrients
  - a. Protein: provided for fetal growth demands
  - b. Vitamins: especially folic acid to prevent anemia, neural tube defects
  - c. Minerals: supplemental iron to prevent anemia
  - d. Calcium: from milk and cheese to promote fetal bone and tooth development, prevent maternal bone loss
4. Fluids: 6 to 8 glasses/ day
5. Daily minimum food intake
  - a. Based on a balanced diet; include minerals (e.g., iron, calcium, phosphorus, iodine, zinc, sodium); iodized salt provides sodium and iodine; sodium restriction is potentially dangerous because it limits interstitial fluid reserve needed if maternal

blood volume decreases

b. Servings of specific nutrients

- (1) Four dairy products: provide calcium, protein, vitamins A and D, riboflavin
- (2) Three (2 oz) servings of protein
- (3) Six or more servings of bread and cereal
- (4) Five servings of fruits or vegetables containing vitamin C
- (5) One serving of leafy, dark-green or deep-yellow vegetables
- (6) One serving of yellow fruit or vegetables; two servings of other vegetables or fruits

6. Food restrictions

- a. Shrimp, salmon, pollack, catfish, canned light tuna; no more than one to two servings a week
- b. Albacore white tuna; no more than 6 ounces in one week
- c. Privately caught fish: check with local health department before eating

7. Foods to avoid

- a. Raw fish, especially shellfish; soft-scrambled eggs; foods made with raw or lightly cooked eggs
- b. Unpasteurized juices and milk
- c. Foods made from soft cheeses (e.g., brie, feta, Camembert, Roquefort, queso blanco, queso fresco, Panela)
- d. Raw sprouts, especially alfalfa sprouts
- e. Herbal supplements and teas
- f. Fish high in mercury (e.g., shark, swordfish, king mackerel, tilefish)
- g. Raw or undercooked meat, poultry, seafood, hot dogs
- h. Deli meats (e.g., ham, bologna): can cause food poisoning; must be reheated before eating

L Pregnant adolescent nutritional needs

1. Weight gain: pregnancy and developmental growth are added together
2. Iron needs: increased to support enlarging muscle mass, increasing blood volume
3. Calcium intake: increased to 400 mg; requires 1- to 2-g calcium diet

M Nutrition and related nursing care

1. Assess nutritional status

- a. Physical, cultural, economic, and psychologic needs
- b. Preconception; obesity or underweight; age and parity; individual needs; biologic interactions among mother, fetus, and placenta
- c. Parturition: weight gain (e.g., quality of gain, gain related to fetal size); severe caloric restriction and weight reduction contraindicated (increased risk to mother and fetus, especially during organogenesis)

2. GI discomforts

- a. Nausea and vomiting: instruct to eat dry crackers in morning; limit fluids with meals; eat small, frequent meals; restrict fat; eat high-carbohydrate diet; eat protein snacks at bedtime

- b. Constipation: instruct to increase fluids and fiber; maintain appropriate activity level

## ***Nursing Care during the Prenatal Period***

### **Assessment/Analysis**

#### 1. Initial visit

- a. Date of last menstrual period
- b. Personal, gynecologic, family medical history; obstetric history using GTPAL system
  - (1) Gravida: number of conceptions
  - (2) Term births: number of births between 37 and 40 weeks' gestation
  - (3) Preterm births: number of births between 20 and 36 weeks' gestation
  - (4) Abortions: number of spontaneous or induced terminations of pregnancy before 20 weeks' gestation
  - (5) Living children: number of children alive at time of assessment
- c. Physical examination including baseline vital signs, weight
- d. Pelvic examination: vaginal, rectal
- e. Current nutritional status; dietary history
- f. Laboratory tests (some tests performed at subsequent visits)
  - (1) Complete blood count; hemoglobin and hematocrit; blood type to determine ABO incompatibility; Rh factor (if indicated, antibody titer test and/or indirect Coombs test) to determine potential hemolytic condition)
  - (2) Tuberculosis; Tay-Sachs, particularly for Jewish women; sickle cell, particularly for African-American women
  - (3) Pap test for cancer; wet prep for bacterial vaginosis (linked to preterm labor)
  - (4) Serologic test for syphilis, repeated at 32 weeks; cervical smears for gonorrhea and chlamydia
  - (5) Rubella titer: titer of 1:8 considered immune
  - (6) Cytomegalovirus, hepatitis B, HIV, parvovirus, toxoplasmosis, varicella-zoster virus
  - (7) Herpes culture: first visit, at 36 weeks, if woman or partner has history of genital herpes
  - (8) Alpha-fetoprotein (AFP): at 14 to 16 weeks; screening test to determine neural tube defects, Down syndrome, other congenital anomalies
  - (9) Routine sonogram: at 18 to 20 weeks; confirms gestational age; assesses placenta, fetus, amniotic fluid
  - (10) Chorionic villi sampling or amniocentesis: determines chromosomal or other abnormalities for women at risk (35 years or older)
  - (11) Serum glucose level: at 26 to 28 weeks for gestational diabetes
  - (12) Group B streptococcus culture: after 36 weeks
- g. Understanding of pregnancy and related care
- h. Evidence of domestic violence (e.g., partner answers questions for woman, injuries to breast/abdomen, multiple health care visits)

2. At all visits: vital signs; weight; urinalysis for ketones, albumin, and glucose; abdominal palpation; auscultation of fetal heart, fetal activity; height and size of fundus; facial or digital edema; presence of domestic violence

## Planning/Implementation

1. Teach expectant mother or parents
  - a. Anatomy and physiology of pregnancy, labor, and birth
  - b. Physiologic changes and related discomforts occurring during pregnancy (e.g., nausea, vomiting, backaches, varicosities, hemorrhoids, constipation, leg pain)
  - c. Changes in nutritional needs and how to meet them; consider cultural and personal preferences
  - d. To avoid alcohol, tobacco, contact with secondhand smoke (causes maternal and fetal vasoconstriction resulting in intrauterine growth restriction),
  - e. To check with health care provider before taking over-the-counter (OTC), prescription drugs, herbs; (e.g., nonsteroidal antiinflammatory drugs (NSAIDs) considered harmless may be teratogenic to fetus)
  - f. Importance of adequate fluid intake, moderate exercise to promote circulation and prevent stasis
  - g. Importance of continuing breast self-examination throughout pregnancy
  - h. To notify health care provider when membranes rupture and/or regular contractions are 5 to 10 minutes apart
2. Teach expectant mother and/or parents to monitor for and report complications
  - a. Visual disturbances; edema of face, fingers, or feet; persistent, severe headaches; epigastric pain; seizures (preeclampsia)
  - b. Persistent, severe vomiting (e.g., hyperemesis gravidarum)
  - c. Signs of infection (e.g., burning on urination)
  - d. Unusual vaginal discharge, including blood (e.g., placenta previa)
  - e. Abdominal pain (e.g., abruptio placentae)
  - f. Absence of or decrease in fetal movements after initial presence (nonreassuring fetal sign)
  - g. Signs and symptoms of preterm labor (e.g., rupture of membranes)
3. Respond to questions (e.g., bathing, douching, work, sex, exercise)
4. Help expectant parents discuss and explore feelings related to childbearing and childrearing
5. Identify expectant parents' support systems
6. Prepare expectant father or significant other for coaching and supportive role during pregnancy, labor, and birth
7. Prepare expectant mother for physical work of labor through relaxation and breathing exercises for various phases of labor
8. Discuss various breathing techniques (e.g., slow-paced, modified-paced, pattern-paced,)
9. Refer to preparatory classes, if appropriate
10. Encourage monthly and final weekly visits

11. Explore findings that indicate domestic violence; follow up to prevent damage to mother and fetus

## **Evaluation/Outcomes**

1. Expectant mother
  - a. Keeps weight gain within recommended limits
  - b. Abstains from alcohol, drugs, and tobacco
  - c. Adjusts to physiologic changes associated with pregnancy
  - d. Identifies signs of complications
  - e. Attends childbirth classes with partner/coach
2. Fetus
  - a. Survives intrauterine period
  - b. Maintains growth and development within acceptable parameters

# Intrapartum Period (Labor and Birth)

## Data Base

A Labor: involuntary physiologic process whereby contents of gravid uterus are expelled through birth canal into external environment

B Anatomy of bony pelvis

1. Classification of pelvis: gynecoid (female pelvis), android (male pelvis), anthropoid (similar to male pelvis), platypelloid (flat pelvis)
2. True pelvis: bony inner pelvis through which fetus must pass (true conjugate, cannot be measured directly); accurate measurement determined with computerized tomography, ultrasonography

C Attitude: relationship of fetal parts to each other

D Lie: relationship of long axis of fetus to long axis of mother

E Presentation: body part of fetus that engages in true pelvis

1. Cephalic (head): vertex, brow, or face
2. Breech: frank, complete, single or double footling
3. Shoulder: fetus cannot travel through birth canal

F Position: relationship of presenting parts to four quadrants of mother's pelvis (left [L] or right [R]; anterior [A] or posterior [P]; occiput [O]; mentum or face [M]; sacrum [S])

1. Vertex: occiput, LOA, LOP, ROA, ROP
2. Face: mentum (chin), LMA, LMP, RMA, RMP
3. Breech: sacrum, LSA, LSP, RSA, RSP

G Station: relationship of presenting part to imaginary line between ischial spines

1. Floating: presenting part movable above pelvic inlet
2. Engaged: biparietal plane has passed pelvic inlet
3. Station 0: presenting part at level of the ischial spines; levels above spines -1, -2, -3; levels below spines +1, +2, +3 ([Figure 25-2: Stations of presenting part](#))

**FIGURE 25-2** Stations of presenting part. (From Lowdermilk DL, Perry SE, Cashion MC: *Maternity nursing*, ed 8, St. Louis, 2011, Mosby.)

## H Amniotic fluid: enclosed in amniotic sac

1. Spontaneous rupture of membranes (SROM or SRM): usually in mid- or late labor; can occur before contractions begin (premature rupture of membranes [PROM])
2. Artificial rupture of membranes (amniotomy, AROM, or ARM): expedites labor by increasing dilation and effacement; done when presenting part is engaged
3. Confirmation of amniotic fluid
  - a. Nitrazine paper: positive when pH is greater than 7.0; paper changes color; result compared to color code on Nitrazine roll
  - b. Fern test: dried amniotic fluid on slide examined with microscope reveals frond-like pattern
4. Assessment of amniotic fluid
  - a. Color: strawlike and clear; may contain small particles of vernix caseosa; greenish color indicates meconium staining (nonreassuring fetal sign)
  - b. Odor: musky-smelling but not offensive; foul-smelling indicates infection (chorioamnionitis)
  - c. Amount: approximately 1000 mL at term; 1500 to 2000 mL (hydramnios, polyhydramnios); scant amount (oligohydramnios); congenital anomalies associated with scant or excessive (e.g., esophageal atresia) fluid
5. Amniotic fluid index (AFI): extent of amniotic fluid in all four quadrants surrounding maternal umbilicus; expected range is 7 to 18 cm; less than 5 to 6 cm is oligohydramnios; greater than 19 to 22 cm is hydramnios

## I Clinical findings before labor

1. Physiologic
  - a. Lightening: fetus drops into pelvis
  - b. Preparatory contractions (Braxton Hicks): irregular mild contractions in preparation for true labor; when walking contractions subside
  - c. Increased vaginal secretions
  - d. Softening of cervix (ripening)
  - e. Bloody show: mucous plug expelled; accompanied by small blood loss; can occur before or during labor
2. Psychologic: mother shows signs of nesting (increased activity) caused by sudden rise in energy level (spurt of energy)

## J Clinical findings of true labor

1. Regular uterine contractions that increase in frequency, strength, and duration and do not disappear when lying down or walking
2. Effacement (shortening or thinning of cervix) dilation of cervix

## K Stages of labor and maternal changes

1. First stage: from onset of true labor to complete effacement and dilation of cervix

- a. Latent phase: mild, short contractions, cervix dilated 0 to 3 cm; client excited that labor has started, some apprehension; follows directions readily; walking assists labor process
- b. Active phase: moderate to strong contractions about 5 minutes apart, cervix dilates from 4 to 7 cm, bloody show, membranes may rupture; slow, deep-breathing techniques help with relaxation; increasing difficulty in following directions; analgesic may be needed for discomfort; need for supportive measures (e.g., encouragement, praise, reassurance, back pressure or back rubs); client/significant other seek information regarding progress of labor
- c. Transition phase: strong contractions 1 to 2 minutes apart (lasting 45 to 60 seconds or more with little rest in between); cervix dilates from 7 to 10 cm with increased bloody show; becomes irritable, restless, agitated, emotional, belches, has leg tremors, perspires, develops pale white ring around mouth (circumoral pallor), flushed face, sudden nausea, may vomit; feels need to have bowel movement because of pressure on anus; may be unable to communicate or follow directions; requires focused emotional support

2. Second stage: begins with full dilation of cervix and ends with birth

- a. Latent phase: may last up to 1 hour with decrease in strength and frequency of contractions and without urge to push
- b. Active phase: urge to push; contractions stronger with increased frequency
- c. Transition phase: begins with fetal head on perineum; perineum bulges when pushing with contractions; client makes grunting sounds; behavior changes from irritability to involvement with birth process; sleep and relaxation between contractions; leg cramps are common
- d. Mechanisms of second stage labor: rotation and descent of fetus in vertex presentation through pelvis
  - (1) Engagement, descent with flexion: at onset of second stage, head descends and chin flexes on chest
  - (2) Internal rotation: as labor contractions and uterine forces move fetus downward, head internally rotates to pass through ischial spines
  - (3) Extension: occiput emerges under symphysis pubis and head is born by extension
  - (4) External rotation: rotation of shoulders to an anterior/posterior position
  - (5) Expulsion: remainder of fetus's body is born

3. Third stage: begins after birth through expulsion of placenta

- a. Placental separation (5 to 30 minutes) heralded by globular shape of uterus, lengthening of umbilical cord, and gush of blood
- b. May have alteration in perineal structure either from episiotomy (prophylactic incision into perineum to allow for birth of head) or from lacerations caused by expulsion of presenting part

4. Fourth stage: follows expulsion of placenta to 2 hours after birth

- a. Fundus firm in midline, at or slightly above the umbilicus
- b. Bloody vaginal discharge (lochia rubra)

c. Fatigue, thirst, chills, nausea; excitement and intermittent dozing

## Related Pharmacology

### **Oxytocics**

#### A Description

1. Stimulate uterus to contract
2. Induce labor; infused slowly
3. Augment contractions that have already begun
4. Induce contraction of lacteal glands, which promotes let-down reflex for breastfeeding
5. Exert vasopressor and antidiuretic effects
6. Enhance postpartum uterine contraction; infused rapidly
7. Available in IM, IV, oral, and nasal preparations

B Example: oxytocin (Pitocin, Syntocinon)

#### C Adverse side effects

1. Maternal
  - a. Hypertension (contracts smooth muscles of blood vessels)
  - b. Dysrhythmias; tachycardia (vasoconstriction)
  - c. Hypertonic uterus; uterine rupture
  - d. Water intoxication (antidiuretic effect) may precipitate seizures and coma
2. Fetal: caused by tetanic uterine contractions
  - a. Anoxia; asphyxia (vasoconstriction)
  - b. Dysrhythmias (premature ventricular complexes [PVCs], bradycardia)
  - c. Hyperbilirubinemia (hepatic dysfunction)

#### D Nursing care associated with oxytocics

1. Monitor vital signs every 30 to 60 minutes and with each dose increase
2. Have oxygen and emergency resuscitative equipment available
3. Maintain continuous fetal monitoring; assess uterine contractions and tone, and FHR every 15 minutes
4. Use infusion-control device for IV administration; always given by secondary line (IV piggy back [IVPB])
5. Discontinue infusion for prolonged uterine contractions, inadequate uterine resting tone, or nonreassuring fetal response to contractions.

### **Prostaglandins**

#### A Description

1. Stimulate uterine contractions
2. Help to ripen or soften cervix
3. Enhance postpartum uterine contraction
4. Available in oral, rectal, or vaginal preparations

B Examples: misoprostol (Cytotec), dinoprostone (Cervidil), carboprost (Hemabate)

C Major adverse side effects: maternal

1. Hypertonic uterus, uterine rupture
  2. Nausea, vomiting, diarrhea, vasoconstriction; more common with carboprost (should never be administered IV)
- D Nursing care associated with prostaglandins
1. Monitor continuously, particularly uterine contractions
  2. Have oxygen and resuscitative equipment available

## ***Opioid Analgesics and Anesthetics***

### A Description

1. Relieve discomfort of active labor and birth
2. Administered via IV, IM, epidural, or intrathecal routes
3. Administration timed to allow metabolism and excretion of drug before birth to avoid respiratory depression in the newborn

B Examples: hydromorphone (Dilaudid), fentanyl (Sublimaze), sufentanil citrate (Sufenta), butorphanol (Stadol), nalbuphine (Nubain)

### C Regional administration

1. Epidural: during labor, during cesarean birth, and postcesarean when abdomen is being closed
2. Spinal: during cesarean birth; inserted in subarachnoid space; given in a single dose; may wear off before procedure is complete; epidural route more common
3. Combination intrathecal
4. Pudendal: during second stage of labor
5. Local infiltration: during repair of episiotomy

### D Nursing care of clients receiving analgesic/anesthetic agents

1. Keep naloxone (Narcan) available to counteract respiratory depression if it occurs
2. Observe client and newborn for respiratory depression; monitor mother for hypotension
3. Epidural: monitor client for hypotension; if hypotension occurs, position on left side, increase IV infusion, administer oxygen, assess FHR
4. Pudendal: explain that it eliminates discomfort during an episiotomy and its repair; assess for vaginal wall or perineal hematoma
5. Spinal: monitor for headache that increases with head elevation; usually in first 24 to 72 hours; keep client supine

## ***Nursing Care during the Intrapartum Period***

## **Assessment/Analysis**

1. Fetal heart rate and pattern
2. Age, weight, height, vital signs, allergies
3. Obstetric history; expected date of birth; intent to breastfeed or formula feed; prenatal care
4. Medical history

5. Time and type of last meal
6. Time of onset of contractions (beginning of one contraction to beginning of next contraction) and their frequency, duration, and intensity
7. Presence of bloody show; status of amniotic membrane
8. Leopold maneuvers to determine fetal presentation, position, and station ([Figure 25-3: Leopold maneuvers](#))

**FIGURE 25-3** Leopold maneuvers. (From Lowdermilk DL, Perry SE, Cashion MC: *Maternity nursing*, ed 8, St. Louis, 2011, Mosby.)

- a. A—Identifies fetal lie (longitudinal or transverse) and presentation (cephalic or breech)
  - b. B—Identifies fetal presentation
  - c. C—If head is presenting and not engaged, determines attitude of head (flexed or extended)
  - d. D—If cephalic prominence is on same side as back, indicates that presenting head is extended and face is presenting
9. Factors that influence labor
    - a. Power: contraction's expulsive effect
    - b. Passenger: fetus's size, position, and presentation
    - c. Passageway: maternal pelvis and soft tissue
    - d. Position of client: side-lying, walking, sitting, semirecumbent, on hands and knees, supine
    - e. Psyche: emotional energy and anxiety level
  10. Emotional response to labor; presence of support persons

## Planning/Implementation

### First Stage

1. Orient to unit
2. Time and assess contractions (e.g., palpation, electronic monitor)
3. Assess fetal heart rate (e.g., auscultation, Doppler, electronic monitor)
  - a. Identify area of maximum intensity of fetal heart tones ([Figure 25-4: Areas of maximum intensity of fetal heart tones \[FHTs\] for different fetal positions](#))

**FIGURE 25-4** Areas of maximum intensity of fetal heart tones (FHTs) for different fetal positions. **A**, Presentation is usually breech if FHTs are heard above the umbilicus. **B**, Presentation is usually vertex if FHTs are heard below the umbilicus. *RSA*, Right sacrum anterior; *ROP*, right occipitoposterior; *RMA*, right mentum anterior; *ROA*, right occipitoanterior; *LSA*, left sacrum anterior; *LOP*, left occipitoposterior; *LMA*, left mentum anterior; *LOA*, left occipitoanterior. (From Lowdermilk DL, Perry SE: *Maternity and women's health care*, ed 9, St. Louis, 2007, Mosby.)

- b. Attach external or internal (spiral scale electrode inserted clockwise and removed counterclockwise) fetal monitor
- c. Encourage to limit movement to prevent interference with accurate tracings
- d. Monitor during a contraction for rate, rhythm, increases, and decreases and for 30 seconds after end of each contraction to identify increases or decreases in fetal response to contractions

4. Interpret electronic fetal/maternal monitoring results ([Figure 25-5](#): Display of fetal heart rate and uterine activity on monitor paper)

**FIGURE 25-5** Display of fetal heart rate and uterine activity on monitor paper. (From Tucker SM, Miller LA, Miller DA: *Mosby's pocket guide to fetal monitoring*, ed 6, St. Louis, 2009, Mosby.)

a. Baseline fetal heart rate

- (1) Average rate during a 10-minute segment excluding periodic or episodic changes, periods of marked variability, and segments of baseline that differ by more than 25 beats/min
- (2) Expected range at term is 110 to 160 beats/min

b. Tachycardia

- (1) Baseline FHR more than 160 beats/min for 10 minutes or longer; may be early sign of fetal hypoxemia, especially when associated with late decelerations and minimal or absent variability
- (2) Can result from maternal or fetal infection, maternal hyperthyroidism, fetal anemia, or in response to drugs (e.g., atropine, hydrOXYzine [Vistaril], terbutaline [Brethine]), or illicit drugs (e.g., methamphetamines, cocaine)
- (3) Interventions: decrease maternal fever; administer oxygen by face mask

c. Bradycardia

- (1) Baseline FHR less than 110 beats/min for 10 minutes or longer; may be later sign of fetal hypoxia
- (2) Can result from placental transfer of drugs (e.g., anesthetics), prolonged compression of umbilical cord, maternal hypothermia or hypotension
- (3) Interventions: observe for prolapsed cord, reposition on side, administer oxygen by face mask, stimulate fetal scalp

d. Variability

- (1) Irregular fluctuations in baseline FHR of two or more cycles per minute
- (2) Temporary decrease in variability when fetus is in a sleep state; sleep states usually do not last longer than 30 minutes
- (3) Ranges of variability based on visualization of amplitude of FHR in peak-to-trough segment in beats/min
  - (a) Absent or undetected variability (nonreassuring fetal sign)

- (b) Minimal variability (greater than undetected but not more than 5 beats/min)
- (c) Moderate variability (6 to 25 beats/min)
- (d) Marked variability (greater than 25 beats/min)
- (4) Diminished variability: may result from fetal hypoxemia, acidosis, drugs that depress CNS (e.g., opioids, barbiturates, tranquilizers, general anesthetics)
- (5) Interventions for diminished variability: monitor for other nonreassuring FHR patterns; administer oxygen by face mask; provide external or scalp stimulation; assist with placement of internal fetal monitor; prepare for birth
- (6) Interventions for increased variability (marked variability): monitor for other nonreassuring FHR patterns

#### e. Accelerations

- (1) Abrupt increase in FHR above baseline to 15 beats/min or more lasting 15 or more seconds, with return to baseline less than 2 minutes from beginning of the acceleration
- (2) Occurrence during fetal movements indicates fetal well-being

#### f. Decelerations: types classified by their relation to onset, duration shape, and end of a contraction; can be benign or nonreassuring

- (1) Early decelerations (see [Figure 25-6](#))

**FIGURE 25-6** Early decelerations. (From Tucker SM, Miller LA, Miller DA: *Mosby's pocket guide to fetal monitoring*, ed 6, St. Louis, 2009, Mosby.)

- (a) Decrease in FHR that begins before peak of a contraction with lowest point occurring at peak of contraction; FHR returns to baseline when uterine contraction ends
- (b) Common in first stage of labor when cervix is dilated 4 to 7 cm; occasionally in second stage with pushing
- (c) Response to head compression; benign

- (d) Intervention: not necessary
- (2) Late decelerations (see [Figure 25-7](#))

**FIGURE 25-7** Late decelerations. (From Tucker SM, Miller LA, Miller DA: *Mosby's pocket guide to fetal monitoring*, ed 6, St. Louis, 2009, Mosby.)

- (a) Decrease in FHR that begins after contraction has started, with lowest point of deceleration occurring after peak of contraction; FHR returns to baseline after contraction ends
  - (b) May occur at any time during labor
  - (c) Indicates fetal hypoxemia due to uteroplacental insufficiency; may be benign (e.g., maternal supine hypotension syndrome) or caused by preexisting maternal disorders, complications of pregnancy; ominous if persistent, repetitive, and accompanied by decreased variability and tachycardia
  - (d) Interventions: identify cause (e.g., palpate uterus to assess for hyperstimulation, discontinue oxytocin if infusing), correct maternal hypotension (e.g., elevate legs, turn on side), increase IV flow rate, administer oxygen via face mask, perform fetal scalp/acoustic stimulation, assist with placement of internal fetal monitor, prepare for and assist with birth
- (3) Variable decelerations (see [Figure 25-8](#))

**FIGURE 25-8** Variable decelerations. (From Tucker SM, Miller LA, Miller DA: *Mosby's pocket guide to fetal monitoring*, ed 6, St. Louis, 2009, Mosby.)

- (a) Abrupt onset to lowest point in less than 30 sec; decrease in FHR below baseline
- (b) Decrease of 15 beats/min or more lasting at least 15 seconds; returns to baseline less than 2 minutes from onset; rapid descent and ascent; may have brief acceleration before and/or after deceleration ("shoulders")
- (c) Occur any time during uterine contraction phase
- (d) Related to umbilical cord compression, decreased amount of amniotic fluid
- (e) Interventions during first stage: change maternal position (e.g., side to side, knee chest); administer oxygen via face mask; discontinue oxytocin if infusing; administer amnioinfusion with warmed saline if oligohydramnios is present
- (f) Interventions during second stage: discourage pushing with contractions to allow fetal recovery; assist with vaginal or cesarean birth if decelerations are due to prolonged cord compression (e.g., tight nuchal cord, short cord, knot in cord, prolapsed cord)

5. Document findings: first stage/latent phase—every 30 to 60 minutes; first stage/active phase—every 15 to 30 minutes; second stage—every 5 to 15 minutes; more frequently if there are nonreassuring signs
6. Assist with or perform vaginal examination
7. Test urine for protein and glucose
8. Assess bladder and bowel function
9. Obtain blood for CBC and crossmatch
10. Prevent supine hypotension by positioning on side to keep gravid uterus from compressing vena cava
11. Provide emotional support to client and labor coach; use measures to promote comfort and rest

- a. Explain procedures and equipment
  - b. Encourage relaxation techniques, positions, pressure points and other techniques learned in childbirth classes
  - c. Assist with breathing techniques (first stage: latent phase—slowed-paced; active phase—modified-paced; transition phase—pattern-paced; second stage: any rhythmic breathing that enhances relaxation) and rebreathing techniques to correct and prevent hyperventilation
  - d. Allow activity as desired to encourage fetal descent and decrease discomfort; recognize maternal movements are restricted with an external fetal monitor
  - e. Administer prescribed analgesics or anesthesia; avoid opioids less than 2 hours before birth to prevent fetal depression; have naloxone available
12. Identify signs of impending second stage of labor
- a. Decrease maternal oral intake because vomiting may occur during transition phase
  - b. Observe perineum for bloody show
  - c. Monitor for spontaneous rupture of membranes
    - (1) Assess for prolapsed cord
    - (2) Obtain fetal heart rate
    - (3) Assess characteristics of amniotic fluid: amount, color (if greenish, verify if breech position); odor (foul may indicate amnionitis)
13. Monitor for clinical manifestations of potential complications
- a. Prolonged strong contractions (tetanic uterus)
  - b. Taut, board-like abdomen (abruptio placentae)
  - c. Increased pulse and temperature (infection)
  - d. Hypertension (preeclampsia)
  - e. Hypotension (effect of epidural or spinal anesthesia)
  - f. Bright red vaginal bleeding (placenta previa)
  - g. Meconium-stained amniotic fluid (breech position or late nonreassuring fetal sign)
  - h. Abnormal variations in FHR patterns (nonreassuring fetal sign)

## **Second Stage**

1. Allow client to choose pushing and positioning techniques, especially if unmedicated; assist if pushing is ineffective; transfer to birthing room or prepare birthing bed when perineum bulges during contractions
2. Position legs simultaneously if placed in stirrups to avoid trauma to uterine ligaments
3. Monitor FHR every 5 minutes
4. Assist with anesthesia, which may include pudendal block, saddle block, or local infiltration

## **Third Stage**

1. Provide newborn care

- a. Clear airway of mucus
- b. Determine Apgar score at 1 and 5 minutes after birth to determine respiratory effort and physical status ([Table 27-1: Apgar Score](#))
- c. Maintain body heat; mother-newborn skin to skin positioning most effective; dry
- d. Assess for visible anomalies
- e. Allow parents to see newborn; place on maternal abdomen to enhance breastfeeding and begin attachment/bonding process
- f. Administer antibiotic ophthalmic medication into each eye to prevent ophthalmia neonatorum and vitamin K injection to prevent hemorrhagic disorders
- g. Apply identification bracelets to newborn and parents (some facilities include significant others) before leaving birthing area according to institutional protocol

2. Assist with birth of placenta

3. Continue to promote attachment behaviors

4. Provide support for parents if infant is not healthy

5. Document birth and accompanying events

### **Fourth Stage**

1. Palpate fundus for firmness every 15 minutes; if relaxed and bladder is not distended, massage until firm

2. Locate fundus: 2 cm below umbilicus immediately after birth; rises to level of umbilicus 1 hour after birth

3. Palpate for bladder distention (uterus above umbilicus and dextroverted); encourage voiding (uterus unable to contract if bladder is full resulting in hemorrhage)

4. Observe perineum for vaginal bleeding (lochia rubra); count vaginal pads; assess for concurrent uterine relaxation, massage as needed

5. Observe episiotomy or laceration sites for hematoma, bleeding, or edema; apply ice bag to perineum immediately after birth to reduce edema; perineal ecchymosis and perineal/rectal pressure indicate vaginal hematoma

6. Monitor vital signs; report fluctuations

7. Administer prescribed oxytocic medication; may be administered immediately after birth to enhance uterine contraction

8. Keep warm to diminish sensation of chilling; shivering common after birth (exact cause unknown)

9. Provide fluid and food as tolerated

10. Encourage and teach breastfeeding techniques within first hour of birth

### **Evaluation/Outcomes**

1. Mother

a. Progresses through labor culminating in safe birth

b. Remains free of infection

c. Maintains homeostasis

2. Newborn

- a. Establishes airway and respiratory effort, sustaining life without assistance
- b. Achieves Apgar score of 7 or above at 5 minutes after birth
- c. Attempts first breastfeeding

# Postpartum Period

## Data Base

A Puerperium: 6-week period following birth; reproductive organs undergo physical and physiologic changes; emotional changes as responsibilities of parenthood take hold; trend is to increase this period to 3 months and rename it fourth trimester of pregnancy

B Systemic changes during puerperium

### 1. Reproductive system

- a. Uterus: contraction causes involution; afterpains in multiparas may cause discomfort, necessitating analgesics; oxytocin released during breastfeeding enhances involution; involution follows a one-fingerbreadth descent daily; fundus cannot be felt by seventh to ninth day
- b. Lochia: vaginal flow following birth changes from rubra to serosa, then becomes alba
- c. Vagina: returns almost to its prepregnant state through healing of soft tissue and cicatrization
- d. Menstruation: occurs about 6 weeks after birth in non-breastfeeding mothers; up to 24 weeks in breastfeeding mothers
- e. Abdominal wall: soft, flabby; eventually regains tone; separation of abdominal muscles may occur (diastasis recti)
- f. Breasts
  - (1) Luteinizing hormone of anterior pituitary activated after placenta is expelled; prolactin secretion stimulates milk production
  - (2) Breastfeeding mothers; posterior pituitary releases oxytocin that initiates let-down reflex with milk ejection as infant suckles
  - (3) Nonnursing mothers: absence of suckling inhibits oxytocin and prolactin release; let-down reflex diminishes, inhibiting milk production
  - (4) Breast engorgement: in both breastfeeding and nonbreastfeeding mothers on second or third day; result of vasodilation before lactation

### 2. Digestive system

- a. Hunger and thirst requiring oral nourishment to replace calories, protein, and fluid lost during all stages of labor
- b. Constipation and abdominal distention: bowel movements delayed for several days; probably caused by fear of pain from hemorrhoids and/or episiotomy, decreased food intake during labor; fiber, fluid, exercise helpful; stool softeners, suppositories, or enema may be prescribed

### 3. Circulatory system

- a. Blood volume: returns to prepregnant state in 3 weeks
- b. Blood fibrinogen levels and platelets: increase during first week; may lead to thrombus formation; if deep vein thrombosis develops, heparin followed by warfarin (Coumadin) may be prescribed
- c. Leukocytosis: WBCs may increase to  $30,000/\text{mm}^3$  if labor was lengthy

d. Hemoglobin and red blood cell count: decrease on fourth postpartum day

#### 4. Excretory system

- a. Urinary output: increases from second to fifth postpartum day (diuresis)
- b. Retention: diminished bladder tone during pregnancy may result in small, frequent voidings indicating retention with overflow
- c. Lactose in urine from lactogenic hormone
- d. Nitrogen excretion increases

#### 5. Integumentary system

- a. Profuse diaphoresis: excretes wastes
- b. Pigmented skin (e.g., striae, linea nigra, darkened areolae): begins to fade; does not return to nulliparous state

#### 6. Vital signs

- a. Temperature: increases (not above 100.4° F) up to 24 hours after birth as result of exertion and dehydration
- b. Blood pressure: returns to baseline; decrease suggests hemorrhage; increase suggests gestational hypertension
- c. Pulse rate: decreases slightly as result of decreased cardiac effort and decreased blood volume

#### 7. Emotional changes

- a. Occurs in some mothers with individual variations
- b. Emotional lability, irritability, restlessness, and anxiety (postpartum blues) during third to tenth day
- c. Depression without psychotic features (postpartum depression); begins by fourth week or within the first year
- d. Depression with psychotic features (postpartum psychosis); by second week after birth; may have history of psychiatric disorder (e.g., bipolar disorder)

## ***Nursing Care during the Postpartum Period***

### **Assessment/Analysis**

- 1. Breasts: soft, filling, engorged
- 2. Uterus: fundus firm, midline, level in relationship to umbilicus
- 3. Bowel: bowel sounds, stool
- 4. Bladder: voiding
- 5. Lochia
  - a. Color
    - (1) Rubra: 1 to 3 days
    - (2) Serosa: 4 to 10 days
    - (3) Alba: 10 to 21 days
  - b. Amount on pad in less than 2 hours
    - (1) Scant: less than 1 inch
    - (2) Light: less than 4 inches
    - (3) Moderate: less than 6 inches

(4) Heavy: more than 6 inches

6. Episiotomy/incision: redness, edema, ecchymosis, discharge, and approximation (REEDA)

7. Anus: hemorrhoids

8. Legs: Homan sign

9. Emotional response: interaction with infant: taking-in/taking-hold, signs of postpartum blues

## Planning/Implementation

1. Use standard precautions and aseptic technique during perineal care

2. Fundus

a. Palpate for firmness and location ([Figure 25-9](#): Assessment of involution of uterus after childbirth); should remain firm and descend (involute) from midline at level of umbilicus 1 fingerbreadth (1 to 2 cm) per day

**FIGURE 25-9** Assessment of involution of uterus after childbirth. (From Lowdermilk DL, Perry SE, Cashion MC: *Maternity nursing*, ed 8, St. Louis, 2011, Mosby.)

b. Massage boggy fundus until firm; boggy uterus indicates inadequate contractile power of uterus resulting in bleeding

3. Palpate for full bladder (displaces fundus upward toward right); assist to void, if necessary

4. Administer prescribed oxytocic to promote involution (e.g., oxytocin [Pitocin], methylergonovine [Methergine], ergonovine [Ergotrate], carboprost [Hemabate])

a. Maintains uterus in contracted state; controls bleeding from intrauterine sites; maintains tone, rate, amplitude of rhythmic contractions required for involution

b. Methylergonovine and ergonovine may cause hypertension; withhold if blood pressure is higher than 140/90 mm Hg

5. Monitor lochia for color, amount, clots, odor (foul odor indicates beginning infection); report deviations from what is expected

6. Observe episiotomy, if present, for redness, ecchymosis, edema, discharge, approximation (REEDA); may be painful; apply cold applications for first 24 hours, then sitz baths
7. Monitor laboratory reports for hemoglobin, hematocrit, and WBC count
8. Assess need for administration of RhoGAM if Rh negative; administer if prescribed
9. Administer rubella vaccine if indicated
10. Interpret vital signs: bradycardia is expected; temperature above 100.4° F (38° C) for 2 consecutive days (excluding first 24 hours after birth) is sign of beginning puerperal infection; can occur following hemorrhage or trauma; if suspected infection, culture of lochia and diagnostic studies may be ordered; administer prescribed antibiotics, antipyretics
11. Administer prescribed analgesic for pain (e.g., uterine contractions causing afterpains in multiparas)
12. Promote bladder and bowel function; secure catheterization order if necessary
13. Teach mother
  - a. Self-care; assist as needed
  - b. Breast care
    - (1) Inspect breasts for tissue and nipple breakdown, palpate to rule out growths
    - (2) Breast self-examination
    - (3) Apply ice compresses or cool cabbage leaves to breasts, if ordered, to minimize engorgement; recommend well-fitted brassiere to support breasts
  - c. Importance of hand washing when caring for self and infant
  - d. Diet with adequate proteins and calories to restore body tissues; increased caloric intake if breastfeeding; build on cultural and personal food preferences
14. Encourage Kegel exercises to strengthen pubococcygeal muscles
15. Encourage ambulation to prevent blood stasis; maintain bed rest and notify health care provider if signs of thrombophlebitis occur (e.g., discomfort, edema, erythema)
16. Observe for postpartum blues; may be caused by drop in hormonal levels and psychologic factors; if discharged early, mother and support persons should be alerted to signs and symptoms (mothers with history of depression are more likely to have postpartum depression)
17. Meet mother's needs to enable her to meet infant's needs; explore feelings and concerns
18. Assist mother with infant care as needed; support rooming-in
19. Initiate group discussion on breastfeeding, infant care, other concerns
20. Discuss resumption of intercourse and family planning; include information about when to expect menses
21. Encourage to contact personnel when questions arise
22. Involve family in care and teaching

## Evaluation/Outcomes

1. Progresses through process of involution
2. Remains free from hemorrhage, infection, and pain

3. Maintains bowel function
4. Initiates voiding and empties bladder
5. Performs perineal care after each voiding/defecation
6. Successfully feeds and cares for infant
7. Maintains emotional health

## CHAPTER 26

# **Nursing Care of Women at Risk during Pregnancy, Labor, Childbirth, and the Postpartum Period**

---

# Tests to Identify and/or Monitor High-Risk Pregnancy

## A Alpha-fetoprotein (AFP) enzyme blood test

1. Increase identifies fetus with neural tube defects (spina bifida, anencephaly); may indicate multiple pregnancy; followed by ultrasonography and amniocentesis when increased for two samples; done at 14 to 16 weeks' gestation
2. Nursing care: food or fluid restrictions are not required

## B Ultrasonography (sonogram)

1. Identifies multiple pregnancy, placental location, and gestational age by measurement of biparietal diameters; visualizes organ formation
2. Nursing care: encourage fluids; teach to refrain from voiding before test, when performed during first 20 weeks' gestation, to improve visualization

## C Chorionic villi sampling (CVS)

1. Supplies chromosomal data; done at 10 to 12 weeks' gestation; sonogram before test to determine placental location, uterine position, and relative placement of neighboring organs (bowel, blood vessels)
2. Nursing care: instruct to drink fluid to fill bladder; after test monitor for uterine contractions and vaginal discharge; teach to monitor for infection

## D Amniocentesis

1. Amniotic fluid detects gender, chromosomal or biochemical defects, fetal age; reveals lecithin to sphingomyelin (L/S) ratio (2:1 ratio indicates lung maturity); phosphatidylglycerol (PG) after 35th week (indicates fetal lung maturity); increased bilirubin level (for Rh incompatibility); amniotic fluid index; biophysical profile of fetus; sonogram before test to locate placenta, fetus, and area of amniotic fluid suitable for aspiration
2. Nursing care: instruct to void; assess fetal heart rate (FHR) during and after test; after test monitor for uterine contractions, vaginal discharge; teach to rest and monitor for infection

## E Nonstress test (NST)

1. Monitors accelerations of FHR in response to fetal movement over 30- to 40-minute period
2. Classification of results
  - a. Reactive: indicates fetal well-being; baseline FHR 110 to 160 beats/min; 2 accelerations in 10 minutes, each increasing FHR by 15 beats/min and lasting 15 seconds
  - b. Nonreactive: indicates nonreassuring prognosis: criteria not met (see above)
  - c. Unsatisfactory: result cannot be interpreted; test repeated in 24 hours
3. Nursing care: explain test; explain why fasting is unnecessary; document fetal monitor recordings; evaluate physiologic and emotional responses to test and its results

## F Contraction stress test (CST)

1. Demonstrates if fetus can withstand decreased oxygen during a contraction;

contraction produced by exogenous oxytocin or manual stimulation of nipples or moist heat

## 2. Classification of results

- Negative: indicates fetus should survive labor; no late decelerations with minimum of three contractions in 10 minutes
- Positive: repetitive late decelerations with more than half of contractions indicate nonreassuring prognosis because of uteroplacental insufficiency; consideration of early intervention
- Suspicious: late decelerations occurring in less than half of contractions; repeat in 24 hours

3. Nursing care: explain procedure; obtain signed consent if needed; instruct to void before test; monitor fetal heart rate for 30 minutes before; monitor after for possible initiation of labor; evaluate physiologic and emotional responses to test and its results

## G Biophysical profile (BPP)

- Assesses fetal breathing movements, gross body movements, tone, amniotic fluid volume, FHR reactivity during NST; each category is assigned a score of 2; used for fetus who may be compromised
- Score of 8 to 10 indicates healthy fetus
- Nursing care: initiate care related to amniocentesis; provide emotional support; evaluate response

## H Maternal assessment of fetal activity

- Client counts number of fetal movements in specified time period; reflects vitality of fetus
- Nursing care: teach how to monitor movements; report fewer than 3 movements in 8 hours, fewer than 10 movements in 12 hours, or no movements in morning

## I Fetal scalp pH sampling

- Capillary blood taken from fetal scalp in utero tested for pH; done during labor when fetal heart patterns are nonreassuring
- If acidotic, immediate birth is indicated
- Nursing care: cleanse vaginal area to avoid contamination during test

## J Fetal acoustic stimulation test (FAST) or vibroacoustic stimulation test (VST)

- Buzzing (FAST) or vibration (VST) created over head of fetus through maternal abdomen for 1-second and 1-minute intervals for 5 minutes
- Reactive test: FHR accelerates; indicates fetal well being
- Nursing care: explain test is noninvasive; obtain baseline FHR before test

## K Digital stimulation

- Application of pressure to fetal head during vaginal examination
- Reactive if FHR accelerates; indicates fetal well being

## L Fetal oxygen saturation

- Provides continuous monitoring of fetal oxygen saturation; sensor inserted next to fetal cheek or temple and connected to monitor
- Expected range is 95% to 100%

# **Nursing Care of Pregnant Women with Special Needs**

## **The Pregnant Adolescent**

### ***Data Base***

A Reasons for high-risk pregnancy

1. Physical development: not yet completed; bone growth may be incomplete; increased levels of estrogen may close epiphyses
2. Preeclampsia: common complication because of poorly developed vascular system in placenta; possible inadequate adolescent nutrition
3. Developmental tasks of adolescence not yet achieved
4. Emotional immaturity

B Factors contributing to incidence of adolescent pregnancy

1. Inadequate coping mechanisms
2. Need to enhance self-concept
3. Belief in own invulnerability
4. Need for immediate gratification: focus on present, not future; lack of concern for long-term consequences
5. Need for attention, closeness, and/or idealized or idolized love
6. Lack of knowledge about conception or contraception
7. Indulgence in risk-taking behavior; sexual acting out
8. Change in concepts of morality; variety of family configurations; increase in dysfunctional families

### ***Nursing Care of Pregnant Adolescents***

#### **Assessment/Analysis**

1. Personal and family health; menstrual history
2. Nutritional status
3. Drug/alcohol abuse
4. Developmental level
5. Support system; financial status
6. Potential role of infant's father
7. Attitude about pregnancy (e.g., denial, ambivalence); understanding of responsibility of pregnancy and motherhood

#### **Planning/Implementation**

1. Establish a trusting relationship
2. Refer to appropriate agencies and resources
3. Promote problem-solving abilities

4. Involve father, if desired
5. Provide prenatal education; encourage consistent prenatal care
6. See [Chapter 25](#), Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period; Nursing Care during the Prenatal Period, Nursing Care during the Intrapartum Period; and Nursing Care during the Postpartum Period

## **Evaluation/Outcomes**

1. Arrives at decisions regarding pregnancy
2. Keeps prenatal appointments and attends child-care classes
3. Involves significant others in planning during pregnancy and for the future

## **The Older Pregnant Woman (35 Years of Age or Older)**

### ***Data Base***

A Reasons for high-risk pregnancy

1. Increased chance of chromosomal abnormalities
2. Preexisting illness
3. Increased incidence of multiple gestation secondary to fertility medications
4. Increased risk for spontaneous abortions and preterm labor
5. Emotional concerns related to changes in role, job, income, and child-care issues

### ***Nursing Care of Older Pregnant Women***

## **Assessment/Analysis**

1. Health history; gynecologic/obstetric history (fibroids; nulliparous; grand multipara); family health history
2. Genetic history, counseling, and testing
3. Nutritional status
4. Prescribed/over-the-counter medications and supplements

## **Planning/Implementation**

1. Refer for genetic counseling
2. Provide prenatal care with emphasis on preexisting conditions and immunizations
3. Allow for verbalization of plans regarding work, changing responsibilities, and altered lifestyle

## **Evaluation/Outcomes**

1. Expresses feelings regarding expectations of body changes
2. Uses appropriate agencies for risk assessment
3. Makes appropriate plans for role change during pregnancy and after birth

# The Pregnant Woman with HIV

## **Data Base**

A Risk for transmission to infant before or around time of birth; increased with low CD4<sup>+</sup> T cell count, prolonged rupture of membranes, and high plasma RNA concentrations  
B Reduced risk for transmission: antiretroviral (ARV) therapy for mother; caesarian birth; ARV therapy for newborn

## **Nursing Care of Women with HIV**

A See [Chapter 25](#), Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period; Nursing Care during the Prenatal Period, Nursing Care during the Intrapartum Period; and Nursing Care during the Postpartum Period  
B Assess for prenatal antiretroviral (ARV) therapy; offer ARV when in labor to decrease risk of transmission  
C Avoid procedures that may increase risk of transmission (e.g., fetal scalp sampling, artificial rupture of membranes)  
D Teach importance of formula feeding rather than breastfeeding (may not be an option for mothers in developing countries)

# The Woman with a Multifetal Pregnancy

## **Data Base**

A Frequency increasing; related to higher incidence of fertility drug use  
B Increasing rate of elective fetal reduction to decrease risk of fetal death; greater incidence of twin births; lower incidence of triplet and higher-order births  
C High probability for developing preterm labor, gestational hypertension, hyperemesis gravidarum, iron or folate anemia, dystocia, twin to twin transfusion, postpartum uterine atony  
D High risk for fetuses being born with congenital anomalies and intrauterine growth restriction (IUGR)  
E Monozygotic (identical) twins: develop from one fertilized ovum and are of same gender, race, heredity, parity; maternal age has no influence on incidence  
F Dizygotic (fraternal) twins: develop from two ova, each of which is fertilized by a different sperm; may be same or different genders; familial predisposition; increased incidence in women who are African-American, multiparous, and younger than 35 years of age

## **Nursing Care of Women with a Multifetal Pregnancy**

See [Nursing Care of Women with Premature Rupture of Membranes](#) and [Nursing Care of Women during Preterm Labor](#)

# Nursing Care of Pregnant Women with Preexisting Health Problems

## Heart Disease

### *Data Base*

A Origin: 50% had rheumatic fever (incidence expected to decrease as incidence of rheumatic fever decreases); congenital and mitral valve disorders are next most common

B Adverse effects of hemodynamics during pregnancy

1. Oxygen consumption increased 10% to 20%; related to needs of growing fetus
2. Plasma level and blood volume increase; red blood cells (RBCs) remain same (physiologic anemia)
3. Peak cardiac output at about 28 weeks
4. After birth, extravascular fluid shifts into intravascular compartment with increased workload of heart

C Functional (therapeutic) classification of heart disease during pregnancy

1. Class I: no limitation of physical activity; no clinical manifestations of cardiac insufficiency or angina
2. Class II: slight limitation of physical activity; may experience excessive fatigue, palpitation, angina, or dyspnea; slight limitations as indicated
3. Class III: moderate to marked limitation of physical activity; dyspnea, angina, and fatigue with slight activity; bed rest during most of pregnancy
4. Class IV: marked limitation of physical activity; angina, dyspnea, and discomfort at rest; indication for termination of pregnancy

### *Nursing Care of Pregnant Women with Heart Disease*

### **Assessment/Analysis**

1. Prenatal period: vital signs, weight gain, dietary patterns, emotional outlook, knowledge about self-care, clinical findings of heart failure, stress factors (e.g., work, household responsibilities), medication regimen
2. Intrapartum period: vital signs (heart rate increases), respiratory changes (dyspnea, coughing, or crackles), FHR patterns
3. Postpartum period: clinical manifestations of heart failure or hemorrhage related to fluid shifts; intake and output (I&O)

### **Planning/Implementation**

1. Prenatal
  - a. Administer prescribed medications: heparin; furosemide (Lasix), digoxin (Lanoxin), beta blockers, antidysrhythmics
  - b. Monitor for heart failure (e.g., respiratory distress, tachycardia); may be

precipitated by severe anemia; accelerated maternal heart rate in latter half of pregnancy results in increased cardiac workload

c. Teach client

- (1) Balance activity and rest, avoid stress
- (2) Wear elastic stockings, elevate legs periodically
- (3) Continue supervision by health care provider specializing in cardiology
- (4) Maintain appropriate dietary intake: adequate calories to ensure appropriate, but not excessive, weight gain; limited, not restricted, sodium intake (2.5 g/day)

2. Intrapartum

- a. Observe progress of labor via clinical findings and electronic fetal/uterine monitoring
- b. Maintain continuous cardiac monitoring
  - (1) Monitor for heart failure
  - (2) Monitor for sudden tachycardia during birth, which may cause cardiac arrest
- c. Encourage to remain in semi-Fowler or left-lateral position
- d. Assist to cope with discomfort; regional analgesia usually used
- e. Assist with birth (e.g., forceps or vacuum extraction) to avoid work of pushing

3. Postpartum: most critical because of increased circulating blood volume after birth of placenta

- a. Monitor for heart failure (increased cardiac output after birth of placenta may cause sudden bradycardia with cardiac arrest)
- b. Administer prescribed prophylactic antibiotics if history of rheumatic fever
- c. Encourage adequate rest (increased oxygen consumption during labor can deplete energy reserves)
- d. Institute early ambulation schedule; apply elastic stockings
- e. Determine newborn risks (e.g., intrauterine growth restriction, preterm birth, hypoxia)
- f. Plan for discharge; refer to agencies for family support if needed

## Evaluation/Outcomes

1. Gives birth to healthy infant
2. Maintains cardiac status within acceptable limits
3. Uses resources to obtain help in the home

## Diabetes Mellitus

### Data Base

A Diabetes mellitus during pregnancy

1. Pregestational
  - a. Type 1: complications include retinopathy, neuropathy, and coronary artery

disease

- b. Type 2: complications may include retinopathy, neuropathy, and coronary artery disease; women with type 1 diabetes are at greater risk

## 2. Gestational diabetes mellitus (GDM)

- a. Controlled by diet
- b. Insulin required in 20% of women

## B Physiology of pregnancy that affects woman with diabetes

1. Vomiting, especially in first trimester, decreases carbohydrate intake, which reduces insulin need; may result in acidosis
2. Progression of hormonal influences
  - a. Insulin production increases, but resistance to insulin occurs
  - b. Insulin need increases
  - c. Exogenous insulin is required to maintain serum glucose level within acceptable range, especially in latter part of pregnancy
3. Basal metabolic rate increases; carbon dioxide combining power decreases; acidosis may result
4. Renal threshold for glucose decreases, glycosuria may result
5. During labor: muscular activity depletes glycogen; insulin need decreases
6. Postpartum period: involution and lactation further reduce insulin need; hypoglycemia may result

## C Hazards of diabetes during pregnancy

1. Increased incidence of fetal deaths, stillbirths, newborn anomalies
2. Neonatal deaths from hypoxia, hypoglycemia, congenital anomalies, preterm labor
3. Excessively large newborn; weight over 4000 g (macrosomia) with inadequate diabetic control
4. Hypertensive disorders, hydramnios
5. Frequent adjustments of insulin dosage because insulin needs vary throughout pregnancy
6. Frequent hospitalizations may be necessary
7. Cesarean birth may be necessary

## ***Nursing Care of Pregnant Women with Diabetes Mellitus***

### **Assessment/Analysis**

1. Number of years with disorder; type 1 or type 2
2. Dietary patterns
3. Signs of infection
4. Results of tests (e.g., blood glucose level, glucose tolerance, glycosylated hemoglobin)
5. Understanding of disorder in relation to pregnancy
6. Support system

### **Planning/Implementation**

1. Care of mother
  - a. Encourage preconception counseling; early, sustained prenatal supervision
  - b. Teach
    - (1) Dietary and insulin regimens; encourage adherence
    - (2) Clinical manifestation of hyperglycemia (acidosis), hypoglycemia (insulin reaction)
    - (3) Blood glucose testing, insulin administration, record keeping
    - (4) Reason for multiple tests to determine fetal well-being (e.g., ultrasound, stress/nonstress tests, biophysical profile, amniocentesis for phosphatidylglycerol levels and L/S ratio)
  - c. Prepare for hospitalization, induction of labor, or cesarean birth if indicated
  - d. Monitor fluid and electrolyte balance for signs of ketoacidosis during prenatal, intrapartum, and postpartum periods
  - e. Monitor glucose levels for first 48 hours postpartum; may not remain diabetic if gestational diabetic
2. Care of neonate—infant of diabetic mother IDM
  - a. Perform newborn assessment; inspect for congenital anomalies related to increased incidence in IDM
  - b. Admit to neonatal intensive care unit (NICU) if necessary
  - c. Keep warm (inadequate temperature control mechanisms)
  - d. Observe respirations (distended stomach may impinge on diaphragmatic movement)
  - e. Perform heel-stick blood specimen for glucose level; assess for hypoglycemia caused by excessive insulin production (blood glucose level 30 to 45 mg/dL)
  - f. Observe for signs of: hypoglycemia (e.g., lethargy, poor sucking, irritability, cyanosis, tremors, hypotonia, cyanosis); hypocalcemia (e.g., muscular twitching, tremors, seizure triggered by minor stimulus)
  - g. Offer prescribed glucose water feedings to prevent acidosis; administer prescribed parenteral glucose if newborn has poor sucking reflex
  - h. Promote early parent-infant interaction

## Evaluation/Outcomes

1. Maintains serum glucose levels within acceptable limits
2. Gives birth to healthy newborn
3. Remains free from complications

## Respiratory Disorders

### Data Base

A Asthma (see [Chapter 32, Nursing Care of Preschoolers Asthma](#))

1. Recurrent lower respiratory tract bronchospasms with airway inflammation and bronchoconstriction

2. Clinical findings: nonproductive cough, chest tightness, dyspnea, wheezing, shortness of breath
  3. Impact on pregnancy: elevation of uterus in abdominal cavity impinges on thoracic cavity; maternal hypoxia causes impaired fetal gas exchange
- B Tuberculosis (see [Chapter 7, Pulmonary Tuberculosis](#))
1. Infectious disease caused by *Mycobacterium tuberculosis*
  2. Risk factors: being immunocompromised, living in substandard conditions
  3. Clinical findings: lethargy, systemic infections, cough, night sweats, weight loss, and fever
  4. Impact on pregnancy: elevation of uterus in abdominal cavity impinges on thoracic cavity; maternal hypoxia causes impaired fetal gas exchange
  5. Screening test: purified protein derivative (PPD) skin test (Mantoux)

#### C Therapeutic interventions

1. Asthma
  - a. Identification of triggers for attacks; limitation of exposure to respiratory tract pathogens
  - b. Allergy desensitization if necessary
  - c. Yearly influenza vaccination recommended by Centers for Disease Control and Prevention (CDC); may be administered during pregnancy because it does not contain live organisms
  - d. Inhaled bronchodilators during exacerbations (e.g., albuterol [Proventil] and metaproterenol [Alupent])
  - e. Glucocorticoids when bronchodilators are ineffective to decrease inflammation and mucus secretions
2. Tuberculosis
  - a. Isoniazid (INH) and rifampin (Rifadin); for resistance to isoniazid, ethambutol (Myambutol) may be substituted; treatment continued for 9 months
  - b. Pyridoxine (vitamin B<sub>6</sub>) 50 mg/day
  - c. Infants of untreated mothers at risk when cared for by mother after birth; transmission rate is 50%
  - d. Uninfected infants may receive bacille Calmette-Guérin (BCG) vaccine

## ***Nursing Care of Pregnant Women with Respiratory Disorders***

### **Assessment/Analysis**

1. Health history to identify past record of respiratory disease, exposure to tuberculosis, clinical manifestations of tuberculosis
2. Results of PPD test, sputum cultures, and chest x-ray film if findings indicate possible infection
3. Case finding to limit spread of infection to family and community

### **Planning/Implementation**

1. Teach client to
  - a. Adhere to pharmacologic protocol
  - b. Maintain pregnancy diet and adequate fluid intake
  - c. Balance activity and rest
  - d. Continue prenatal supervision for both maternal and fetal well-being
2. Monitor fetal heart rate
3. Ensure collaboration between pulmonary and obstetric health care providers

## Evaluation/Outcomes

1. Maintains pharmacologic regimen throughout pregnancy
2. Modifies activities to maintain optimum oxygenation
3. Fetus exhibits expected growth and reactivity

## Cancer

### **Data Base (see Chapter 3, Integral Aspects of Nursing care, Neoplastic Disorders)**

- A Risk factors: increase with age, postponement of pregnancy
- B Incidence: breast most common; cervical, ovarian, melanoma, leukemia, lymphomas, and tubal and thyroid cancers
- C Moral dilemma for childbearing woman, family, and health team
- D Therapeutic interventions
  1. Staging without exposing fetus to radiation: ultrasound, magnetic resonance imaging (MRI)
  2. Laparoscopy used for node sampling; surgical procedures increase risk for preterm labor, IUGR, fetal demise
  3. Contraindicated therapies
    - a. Chemotherapy: teratogenic, especially in first trimester
    - b. Radiotherapy: increases risk of fetal abnormalities, low birth weight, cancer later in life, possible genetic effects on future generations of fetus

### **Nursing Care of Pregnant Women with Cancer**

## Assessment/Analysis

1. Results of blood studies related to organ functioning
2. Review of tumor markers (may be influenced by oncofetal proteins found in maternal blood)

## Planning/Implementation

1. Explain treatment choices and plan
2. Assess understanding of condition and its effects on client and the pregnancy
3. Encourage client and family to express feelings

4. Refer to health care providers, agencies, and clergy as needed

## **Evaluation/Outcomes**

1. Maintains emotional and physiologic well being
2. Verbalizes concerns
3. Arrives at decisions through problem solving
4. Uses support systems

# Nursing Care of Women with Complications during the Prenatal Period

## Hypertensive Disorders of Pregnancy

### **Data Base**

A Classification of hypertensive states

1. Gestational hypertension
  - a. Hypertension during pregnancy beginning in second trimester (20 to 24 weeks); disappears 6 weeks after birth
  - b. May have edema or proteinuria; blood changes rarely occur in uncomplicated gestational hypertension
2. Transient hypertension
  - a. Gestational hypertension without preeclampsia
  - b. Resolves by 12 weeks' postpartum
3. Preeclampsia
  - a. Mild: blood pressure (BP) 140/90 mm Hg on two readings taken 6 hours apart; systolic BP increase of 30 mm Hg or diastolic BP increase of 15 mm Hg; proteinuria +1 (30 mg/dL) or more
  - b. Severe:
    - (1) Objective: BP 160/110 mm Hg or higher on two readings taken 6 hours apart after bed rest; proteinuria +3 to +4; hyperreflexia; oliguria; hemoconcentration
    - (2) Subjective: blurred vision; epigastric pain; irritability; persistent headache
  - c. Blood chemistry: elevated hematocrit and hemoglobin; increased uric acid, liver enzymes, and blood urea nitrogen (BUN); decreased carbon dioxide combining power (may indicate worsening preeclampsia)
  - d. Qualitative urinalysis: increased albumin output (proteinuria) and/or decreased urinary output indicates worsening preeclampsia
4. Eclampsia
  - a. Seizure and/or coma; seizure may be preceded by rolling of eyes to one side while staring
  - b. Occurs after intractable, severe preeclampsia
5. Chronic hypertension: preexisting
6. Preeclampsia superimposed on chronic hypertension
  - a. Previously controlled BP becomes elevated; proteinuria
  - b. Blood chemistry: thrombocytopenia, elevated creatinine; other clinical manifestations of severe preeclampsia

B Risk factors: first pregnancy at younger than 17 years of age; over 35 years of age; obesity; numerous pregnancies; chronic hypertension; diabetes mellitus; severe nutritional deficiencies; multifetal pregnancy; trophoblastic disease

C HELLP syndrome (**H**emolysis, **E**levated **L**iver enzymes, **L**ow **P**latelet count);

preeclampsia with hepatic dysfunction

1. Sudden onset; may not have previous signs of preeclampsia; 2% to 12% incidence in women with severe preeclampsia; occurs after 24 weeks' gestation or after birth
2. Right upper quadrant pain in 90% of affected women; may have proteinuria
3. Blood smear reveals broken RBCs (schistocytes or burr cells)
4. Increased uric acid, liver enzymes, and BUN

D Guidelines for prevention of hypertensive disorders of pregnancy

1. Reduction of risk factors if possible
2. Adherence to prenatal recommendations (e.g., diet, exercise, rest, regular prenatal examinations)
3. Prophylactic treatment is not available
4. Sodium restriction and diuretics are contraindicated

E Therapeutic interventions

1. Gestational hypertension
  - a. Frequent rest periods
  - b. Dietary management with increased fluid intake
  - c. Treated symptomatically
2. Mild preeclampsia
  - a. High-protein diet
  - b. Ambulatory care; frequent visits to health care provider
  - c. Frequent rest periods with feet elevated; side-lying position to enhance renal and placental perfusion
3. Severe preeclampsia or eclampsia
  - a. Hospitalization and complete bed rest
  - b. Magnesium sulfate administered intravenously via infusion pump; if respiratory depression caused by magnesium sulfate occurs, calcium gluconate for mother and levallorphan (Lorfan) for newborn
  - c. Antihypertensives: hydrALAZINE, NIFEdipine (Procardia), methyldopa (Aldomet), labetalol
  - d. Indwelling catheter for output assessment
  - e. Labor induction or cesarean birth
  - f. Betamethasone for preterm birth less than 34 weeks' gestation (stimulates fetal surfactant production)
4. HELLP syndrome
  - a. Same as severe preeclampsia or eclampsia
  - b. Blood or blood product replacement if necessary

## ***Nursing Care of Women with Hypertensive Disorders of Pregnancy***

### **Assessment/Analysis**

1. Clinical indications of cerebral involvement (e.g., persistent headache, visual disturbances, irritability, confusion)
2. Vital signs for hypertension

3. Urinary status for proteinuria, oliguria
4. Extremities for edema, increasing daily weight
5. Epigastric pain

## Planning/Implementation

1. Monitor BP every 15 minutes during critical phase; every 1 to 4 hours as condition improves
2. Insert indwelling catheter; monitor urine for output and proteinuria
3. Monitor edema, daily weights, I&O
4. Administer magnesium sulfate as prescribed (check for sufficient urinary output before starting); assess for therapeutic response (e.g., +2 deep tendon reflexes, increased urinary output, absence of seizures)
5. Monitor for magnesium toxicity
  - a. Assess for depressed or absent deep tendon reflexes (e.g., patellar, brachial)
  - b. Observe for depressed respirations (fewer than 12 to 14 breaths/min), flushed face
  - c. Assess magnesium blood levels every 6 hours; therapeutic range is 4 to 8 mg/dL
  - d. Have calcium gluconate available for magnesium sulfate toxicity
6. Observe for indications of seizure activity (e.g., may be preceded by rolling of eyes to one side with a stare); maintain seizure precautions; monitor vital signs and FHR after seizure
7. Monitor FHR
8. Monitor hematologic studies
9. Maintain on bed rest in side-lying position; maintain quiet, dark environment; limit visitors
10. Offer high-protein diet with adequate sodium intake
11. Explore anxieties and concerns
12. Observe for signs of bleeding and labor
13. Be prepared for induced birth or emergency cesarean birth
14. Continue to monitor for 48 hours after birth during diuresis (seizures [eclampsia] may occur several weeks postpartum)

## Evaluation/Outcomes

1. Maintains (mother and fetus) vital signs within acceptable range
2. Remains free from seizures
3. Maintains fluid balance

## Spontaneous Abortion

### Data Base

A Complete or partial expulsion (incomplete) of products of conception before viability; gestational age 20 weeks or less; weight less than 500 grams; length less than 16.5 cm  
B Incidence: 10% to 20% of confirmed pregnancies

C Risk factors: embryonic defects, maternal hormone imbalances, immunological factors, infections, genetic factors, systemic disorders, external mechanical force, trauma

D Types/clinical findings

1. Threatened abortion: cervix closed, bleeding, cramping, backache; pregnancy may continue uninterrupted
2. Imminent or inevitable abortion: cervix dilates, bleeding, severe cramping, membranes may rupture
3. Incomplete abortion: all products of conception not expelled after cervical os has dilated
4. Complete abortion: all products of conception expelled within 24 to 48 hours
5. Missed abortion: fetus dies in utero but not expelled; risk for developing disseminated intravascular coagulopathy (DIC)
6. Habitual abortions: three consecutive pregnancies that terminate spontaneously

E Therapeutic interventions

1. Maintenance of complete bed rest
2. Diagnostic/therapeutic blood studies: complete blood count (CBC), blood typing, and Rh factor; crossmatching if blood is available; serum progesterone or serial beta human chorionic gonadotropin ( $\beta$ -hCG)
3. Dilation and curettage or vacuum aspiration to remove retained products of conception

## ***Nursing Care of Women Experiencing Spontaneous Abortion***

### **Assessment/Analysis**

1. Vital signs; amount of bleeding
2. Level of pain
3. Emotional response to loss

### **Planning/Implementation**

1. Institute measures to alleviate fear and anxiety
2. Monitor and document amount and type bleeding
  - a. Save and count number of perineal pads
  - b. Distinguish between dark clotted blood and frank bleeding (bright red)
3. Monitor vital signs for hypovolemia, shock, and infection
4. Monitor fundus for firmness after products of conception are expelled
5. Check laboratory reports (e.g., CBC, hemoglobin, hematocrit) in preparation for blood transfusion
6. Administer oxygen if necessary
7. Maintain fluid and electrolyte balance
8. Administer RhoGAM if prescribed
9. Assist with grieving process
  - a. Discuss physiologic reality, but encourage to work through feelings

- b. Expect that grieving may continue for 24 months
- c. Encourage participation with thanatology services and bereavement/support groups when appropriate

10. Educate about necessity for follow-up care

## Evaluation/Outcomes

1. Remains free from complications (e.g., hemorrhage, infection)
2. Expresses feelings

## Ectopic Pregnancy (Tubal Pregnancy)

### **Data Base**

A Implantation of fertilized ovum outside uterus; most frequently (95%) in middle portion of fallopian tube; other sites in abdomen, ovaries, and cervix

B Incidence; rising; 20 in 1000 pregnancies

C Risk factors: Pelvic inflammatory disease (PID), tubal surgery, endometriosis

D Diagnosis: ultrasonography, radioimmunoassay for  $\beta$ -hCG

E Tubal pregnancy pattern

1. Asymptomatic
  2. Spotting after one or two missed menstrual periods; localized tenderness (before rupture)
  3. Sudden, sharp, knifelike lower right or left abdominal pain radiating to shoulder after rupture
  4. Concealed bleeding from site of rupture leads to sudden shock
- F Therapeutic interventions
1. Diagnosis confirmed by ultrasound examination, laparoscopy, or culdocentesis
  2. Immediate blood replacement if blood loss is severe
  3. Removal or surgical repair of ruptured fallopian tube
  4. Pharmacologic therapy: methotrexate to salvage fallopian tube

### **Nursing Care of Women with an Ectopic Pregnancy**

### **Assessment/Analysis**

1. Vital signs, signs of shock
2. Bleeding; rigid, tender abdomen
3. Character and location of pain
4. Level of anxiety

### **Planning/Implementation**

1. Monitor for signs of shock
2. Administer blood transfusion if ordered
3. Administer prescribed analgesics for pain

4. Provide emotional support
5. Provide preoperative and postoperative care
6. Administer RhoGAM if appropriate

## **Evaluation/Outcomes**

1. Remains free from complications
2. States implications for future childbearing
3. Expresses feelings

## **Hyperemesis Gravidarum**

### **Data Base**

A Vomiting that continues past first 10 weeks of pregnancy; excessive, with 5% weight loss

B Incidence: varies from 3 to 10 per 1000 births

C Risk factors: nulliparity, obesity, history of migraine headaches, multifetal pregnancy, may be related to transient hyperthyroidism, may have psychologic component

D Clinical findings: significant weight loss, dehydration (e.g., decreased BP, increased pulse rate, inadequate tissue turgor) cannot retain even clear fluids, electrolyte imbalances

E Therapeutic interventions

1. Laboratory tests (e.g. urine for ketones [acidosis], CBC, electrolytes, liver enzymes, bilirubin level, thyroid studies); psychosocial assessment
2. IV therapy to correct fluid and electrolyte imbalance; nothing by mouth (NPO) for 48 hours after vomiting ceases; antiemetic medications; corticosteroids for intractable vomiting; total parenteral nutrition (TPN) if necessary; psychotherapy if indicated

### **Nursing Care of Women with Hyperemesis Gravidarum**

### **Assessment /Analysis**

1. History for possible causes of vomiting, precipitating factors,
2. Nature of vomitus: frequency, severity, duration of episodes, amount and color
3. Physical examination: vital signs, weight loss, nutritional status, other signs of dehydration
4. Emotional status

### **Planning /Implementation**

1. Monitor client
  - a. IV therapy, I&O
  - b. Frequency, amount, and characteristics of vomiting
  - c. Vital signs, hydration and nutritional status
2. Maintain NPO as ordered

3. Administer prescribed medications and nutritional supplements
4. Provide quiet, restful environment; attempt to eliminate odors
5. Offer prescribed diet: usually small, low-fat, high-protein, bland feedings; document response to oral intake
6. Encourage ventilation of feelings
7. Arrange for continuing care at home

## **Evaluation/Outcomes**

1. Nausea and vomiting do not recur
2. Consumes nutritional meals
3. Gains weight
4. Pregnancy continues to term
5. Newborn is healthy

## **Hydatidiform Mole or Trophoblastic Disease**

### **Data Base**

A Abnormal proliferation of trophoblastic cells covering chorionic villi; associated with high hCG levels

B Categories: hydatidiform mole; complete or partial mole; gestational trophoblastic neoplasia (GTN); metastatic trophoblastic neoplasia (low, intermediate, or high risk); choriocarcinoma may develop with metastasis to lungs

C Incidence: one in 1200 pregnancies; more common in Asian women

D Risk factors unknown; may be related to malnutrition or ovular defect; previous miscarriages; age (early teens, past 40 years); women who have taken clomiphene (Clomid) to stimulate ovulation

E Clinical findings

1. Types
  - a. Molar pregnancy—no fetus or amnion
  - b. Partial molar pregnancy—fetus and/or amniotic sac
2. Uterus: larger for period of gestation; fetal parts not palpable; dough-like consistency; contains mass resembling bunch of grapes
3. Manifestation of gestational hypertension and hyperemesis gravidarum
4. Potential for uterine perforation, hemorrhage, infection
5. Confirmation by ultrasonography

F Therapeutic interventions

1. Evacuation by dilation and curettage or hysterotomy if no spontaneous evacuation
2. Continued follow-up of serum gonadotropin levels for 1 year to rule out choriocarcinoma (increased gonadotropin levels require chemotherapy)
3. Chemotherapy when malignant

### **Nursing Care of Women with Hydatidiform Mole or Trophoblastic Disease**

## **Assessment/Analysis**

1. Vaginal bleeding (brownish, prune juice) containing grapelike tissue
2. Uterine enlargement; fundal height greater than expected for length of pregnancy
3. Vomiting
4. Elevated BP earlier than 24 weeks' gestation
5. Absence of fetal heart tones or activity

## **Planning/Implementation**

1. See Nursing Care under Spontaneous Abortion
2. Teach importance of follow-up care for at least 1 year, especially for serum gonadotropin testing
3. Teach importance of preventing pregnancy for 1 year

## **Evaluation/Outcome**

1. Continues follow-up care
2. Uses measures to prevent pregnancy for 1 year

## **Incompetent Cervix**

### ***Data Base***

A Cervical effacement and dilation in early second trimester; expulsion of products of conception; recurrent miscarriages, each one earlier in pregnancy

B Risk factors: previous forceful/excessive dilation and curettage; previous difficult birth; congenitally short cervix

C Clinical findings

1. Painless contractions in second trimester
2. Preterm birth of nonviable fetus

D Therapeutic interventions

1. Conservative: bed rest; adequate hydration; tocolytic therapy to inhibit uterine contractions
2. Cerclage procedure: during 10 to 14 weeks' gestation; suture or ribbon placed beneath cervical mucosa to close cervix
3. Activity restrictions (e.g., no intercourse, heavy lifting, standing for more than 90 minutes)
4. Cesarean birth or cutting of suture for vaginal birth at term

### ***Nursing Care of Women with an Incompetent Cervix***

## **Assessment/Analysis**

1. Number of weeks gestation
2. Obstetric history
3. Knowledge of treatment options (e.g., cerclage procedure)

## **Planning/Implementation (after cerclage procedure)**

1. Maintain bed rest for 24 hours
2. Monitor vital signs and fetal heart rate
3. Monitor for rupture of membranes or bleeding
4. Teach which activities are restricted and importance of adherence to restrictions

## **Evaluation/Outcomes**

1. Continues pregnancy to term
2. Describes signs of labor
3. States will notify health care provider when labor begins

## **Placenta Previa**

### ***Data Base***

A Placental implantation in lower uterine segment

B Incidence: 0.5% of births; more common in African and Asian woman

C Risk factors: maternal age older than 35 years; history of placenta previa, cesarean births, multiple gestations, and closely spaced pregnancies; endometrial scarring

D Types

1. Type I—low-lying: placenta in lower uterine segment next to internal cervical os; as uterus stretches with gestation, placenta moves away from os
2. Type II—marginal: placental edge at os, but does not cover it
3. Type III—partial: placental edge partially covers os
4. Type IV—complete: placenta is centered over os

E Clinical findings

1. Painless, bright red bleeding; hemorrhage in third trimester
2. Soft uterus in latter part of pregnancy
3. May have signs of infection

F Therapeutic interventions

1. Ultrasonography to confirm placenta previa
2. Depend on location of placenta, amount of bleeding, status of fetus
3. Avoidance of vaginal examinations
4. Measures to control bleeding
5. Replacement of blood loss if necessary
6. Home monitoring with repeated ultrasounds for type I—low-lying
7. Cesarean birth, if necessary

### ***Nursing Care of Women with Placenta Previa***

## **Assessment/Analysis**

1. Painless bright red bleeding; absence of pain
2. Clinical manifestations of shock (hypovolemic)

3. Changes in or absence of FHR
4. Level of anxiety (usually increases)

## Planning/Implementation

1. Monitor and document amount of bleeding; count number of perineal pads and extent of saturation to determine blood loss
2. Monitor FHR using electronic device
3. Monitor maternal vital signs using electronic equipment
4. Observe color for pallor or cyanosis; administer oxygen if necessary
5. Emphasize to other health care providers that vaginal examinations are contraindicated
6. Maintain bed rest in semi-Fowler position
7. Monitor hemoglobin and hematocrit, administer IV therapy and/or blood replacement if needed
8. If ultrasound is unavailable and a vaginal examination is necessary, prepare a double setup for vaginal or cesarean birth (rarely done)
9. Prepare for cesarean birth if bleeding persists

## Evaluation/Outcomes

1. Birth of viable, stable newborn
2. Demonstrates hemodynamic stability

## Abruptio Placentae (Premature Separation of Placenta)

### **Data Base**

A Partial, marginal, or complete premature separation of placenta in third trimester; degrees of separation: mild, moderate, severe (grade 1, 2, 3, respectively)

B Risk factors: preexisting hypertension; preeclampsia; eclampsia; cocaine use; abdominal trauma; previous abruptio; multiple gestations

C Clinical findings

1. Vaginal bleeding; concealed if center of placenta separates and margins are intact; overt if placenta separates at margin
2. Moderate to agonizing abdominal pain
3. Persistent uterine contraction; firm to board-like abdomen
4. Fetal hyperactivity, then cessation of fetal movements
5. Hemorrhage, disseminated intravascular coagulopathy (DIC) hypofibrinogenemia may occur

D Therapeutic interventions

1. Replacement of blood loss
2. Administration of oxygen if necessary
3. Maintenance of fluid and electrolyte balance
4. Induction of labor for mild separation with reassuring fetal signs and some cervical

effacement and dilation

5. Emergency cesarean birth for moderate or severe separation, maternal distress, fetal compromise

## ***Nursing Care of Women with Abruptio Placentae***

### **Assessment/Analysis**

1. Pain with or without dark red bleeding
2. Tonicity of abdominal wall
3. Clinical manifestations of shock
4. Changes in or absence of FHR
5. Levels of increasing anxiety

### **Planning/Implementation**

1. Maintain bed rest in lateral recumbent position
2. Monitor FHR with electronic device
3. Monitor maternal vital signs using electronic equipment
4. Determine abdominal pain and tonicity of abdomen
5. Observe color for pallor or cyanosis; administer oxygen if necessary
6. Obtain blood for typing and crossmatching, coagulation studies, hemoglobin, hematocrit
7. Administer IV therapy and/or blood replacement
8. Prepare for Kleihauer-Betke test to assess fetal bleeding into maternal circulation
9. Observe perineal pads for bleeding
10. Prepare for cesarean birth if abruptio is moderate or severe
11. Observe for signs of DIC (e.g., seepage of blood from IV site or incisional areas)

### **Evaluation/Outcomes**

1. Birth of a viable, stable newborn
2. Demonstrates hemodynamic stability

# **Nursing Care of Women with Complications During the Intrapartum Period**

## **Induction or Stimulation of Labor**

### ***Data Base***

A Elective induction (initiation of labor)

1. Pharmacological

- a. Prostaglandin: vaginal insertion of E1 (e.g., misoprostol [Cytotec]) or E2 (e.g., dinoprostone [Cervidil, Prepidil]) to promote cervical softening (ripening) and effacement
- b. Oxytocin: intravenous infusion approximately 8 to 12 hours after prostaglandin administration to stimulate contractions

2. Mechanical means

- a. Artificial rupture of membranes (AROM) (amniotomy)
- b. Nipple massage to stimulate secretion of oxytocin from posterior pituitary gland

B Medical or obstetric indications: diabetes, pyelonephritis, hypertensive disorders, Rh incompatibility, hydramnios, placental insufficiency, rupture of membranes at term before contractions begin, postterm gestation, history of precipitate birth, fetal jeopardy

C Augmentation of labor: promotes labor when it is not progressing (prolonged labor); employs pharmacologic or mechanical means

D Contraindications: cephalopelvic disproportion, malpresentation of fetus, nonreassuring signs of fetal status, placenta previa, active genital herpes

### ***Nursing Care of Women During Induction or Stimulation of Labor***

### **Assessment/Analysis**

1. Obstetric history, estimated date of birth
2. Maternal status (e.g., contractions, status of membranes, status of cervix, ultrasound findings, level of anxiety)
3. Fetal status (e.g., gestational age, absence of cephalopelvic disproportion or other problems, position, results of fetal monitoring and nonstress test)

### **Planning/Implementation**

1. Prepare mother and labor coach for induction (e.g., explain all procedures, obtain informed consent)
2. Obtain and record baseline information (e.g., maternal vital signs, FHR, contractions for later comparison; continue to monitor vital indices)
3. Monitor oxytocin (Pitocin) administration
  - a. Administer piggybacked through infusion device; titrated at 0.5 to 2 mU/min; titrated according to contraction pattern and fetal response

- b. Discontinue: sustained uterine contraction; persistent fetal decelerations; urinary flow decreased to 30 mL/hr (related to water intoxication); signs of placenta previa or abruptio placentae
- 4. Assist with artificial rupture of membranes (amniotomy)
  - a. Maintain asepsis
  - b. Assess FHR immediately after rupture
  - c. Observe color and amount of amniotic fluid
  - d. Record time of rupture (prolonged time after rupture may predispose to sepsis)
- 5. Maintain hydration
- 6. Provide for blood typing, Rh compatibility, crossmatching
- 7. Have oxygen, suction, and resuscitation equipment available
- 8. Prepare for emergency cesarean birth if necessary

## Evaluation/Outcomes

- 1. Progresses through labor to safe birth of newborn
- 2. Remains free from complications

## Premature Rupture of Membranes (PROM)

### **Data Base**

A Spontaneous rupture of membranes before onset of labor

B Maternal implication: ascending infection

C Fetal implications

- 1. Prolapsed cord
- 2. FHR decelerations caused by cord compression from lack of amniotic fluid
- 3. Sepsis from ascending infection

D Therapeutic interventions

- 1. Hospitalization with bed rest after 37 weeks' gestation
- 2. Amnioinfusion of isotonic saline to allow for fetal movement and lessen danger of cord compression
- 3. Prophylactic antibiotics

## **Nursing Care of Women with Premature Rupture of Membranes**

### Assessment/Analysis

- 1. Time of rupture
- 2. FHR and maternal vital signs
- 3. Perineum for prolapsed cord
- 4. Characteristics of leaking amniotic fluid (e.g., odor and color)
- 5. Confirmation
  - a. Fern test: microscopic examination reveals fernlike crystals of sodium chloride
  - b. Nitrazine test: confirms presence of amniotic fluid; paper changes color when

touched by alkaline amniotic fluid (7.0 to 7.5) rather than acidic vaginal secretions

## Planning/Implementation

1. Monitor FHR and maternal vital signs; temperature and pulse every 2 hours
2. Monitor uterine activity
3. Avoid vaginal/cervical stimulation (e.g., unnecessary vaginal examinations)
4. Ensure adequate hydration
5. Educate parents (e.g., amniotic fluid is still being produced, avoid intercourse)
6. Provide perineal hygiene
7. Administer antibiotics as prescribed

## Evaluation/Outcomes

1. Remains free from infection
2. Progresses through labor to safe birth of healthy newborn

## Preterm Labor

### **Data Base**

A Contractions begin after 20th week but before end of 37th week of gestation, causing effacement and dilation of the cervix

B Risk factors: previous preterm labors, risky lifestyle, multiple gestation, maternal fever, opioid use, bacterial vaginitis, multiple abortions, pyelonephritis, asymptomatic bacteriuria

C Diagnostic studies

1. Transvaginal cervical sonography
2. Immunoassay for fetal fibronectin
3. Vaginal examinations to determine cervical changes

D Therapeutic interventions

1. Activity restrictions (no evidence to support effectiveness of continuous bed rest)
2. Treatment of etiology (e.g., antibiotics for pyelonephritis)
3. Tocolytic therapy to decrease frequency and duration of contractions, postponing birth
  - a. Betasymphathomimetics: terbutaline (Brethine)
  - b. Magnesium sulfate
  - c. Prostaglandin inhibitors: indomethacin (Indocin)
  - d. Calcium channel blockers: NIFEdipine (Procardia)
4. Corticosteroid therapy
  - a. Betamethasone (Celestone)
  - b. Administered 24 to 48 hours before birth
  - c. Reduces incidence and severity of respiratory distress syndrome (RDS) in preterm infants; enhances formation of surfactant
  - d. May be contraindicated if woman has an infection

# ***Nursing Care of Women During Preterm Labor***

## **Assessment/Analysis**

1. Number of weeks' gestation
2. Fetal status
3. Signs of labor: two contractions lasting 30 seconds within 15 minutes; cervical dilation less than 4 cm; effacement 50% or less
4. Signs of hemorrhage or infection
5. Signs of severe preeclampsia
6. Rupture of membranes; length of time since rupture
7. Emotional status of mother

## **Planning/Implementation**

1. Prevention by decreasing risk factors
  - a. Discuss impact of drug use and lifestyle risks
  - b. Teach importance of early reporting of temperature elevations
  - c. Check results of prenatal vaginal cultures
  - d. Monitor for urinary tract infections; asymptomatic bacteriuria shows a positive culture of more than  $100,000/\text{mm}^3$
2. Arrange for home health nurse to supervise maternal and fetal status (e.g., vital signs, FHR, breath sounds, fetal activity, hematologic and cervical status, blood and urine glucose levels, fundal height, maternal weight, urine evaluation, presence of edema)
3. Provide home instruction for halting preterm labor
  - a. Rest periods in lateral position; avoidance of vigorous activity
  - b. Increase fluid intake
  - c. Avoid sexual intercourse or sexual activity that leads to orgasm
  - d. Avoid nipple stimulation
  - e. Avoid stressful events
  - f. Empty bladder regularly and if contractions occur
4. Monitor vital signs, FHR, contractions, and progression of labor
5. Maintain bed rest if ordered
6. Provide emotional support; reduce anxiety and prepare for perinatal death
7. Provide care related to tocolytic medications
  - a. Teach about medication; explain that use of pain medications will be limited to avoid their depressive effects on fetus
  - b. Use an infusion pump for administration of IV medications
  - c. Obtain baseline hematologic data and electrocardiographic (ECG) readings if appropriate
  - d. Monitor vital signs (hypotension can occur with all tocolytics, tachycardia can occur with terbutaline)
  - e. Maintain hydration; monitor for pulmonary edema
  - f. Monitor for signs of hypokalemia and hyperglycemia

g. Monitor I&O

h. Provide care related to magnesium sulfate therapy (e.g., assess reflexes and respirations)

8. Prepare to administer corticosteroid therapy

9. Prepare for preterm birth

## Evaluation/Outcomes

1. Exhibits cessation of labor

2. Fetus remains in utero with acceptable FHR and fetal movements

3. Mother and partner list signs and symptoms of preterm labor

## Postterm Pregnancy

### **Data Base**

A Extends beyond 42nd week of gestation or 2 weeks beyond estimated date of birth (EDB); 37 to 42 weeks' gestation is considered full-term

B Fetal risk factors

1. Decreased amniotic fluid may lead to cord compression during labor

2. Decreased placental function because placental aging lowers oxygen and nutritional transport; fetus jeopardized during labor (e.g., asphyxia, hypoglycemia)

3. Increasing size (mainly length) and hardening of skull may contribute to cephalopelvic disproportion

C Maternal risk if infant is excessively large

D Fetal assessment: contraction stress test (CST) to determine ability to tolerate labor

E Therapeutic intervention: induction of labor

### **Nursing Care of Women During Postterm Labor**

### **Assessment/Analysis**

1. Number of weeks' gestation; date of last menstrual period; estimated date of birth

2. Biophysical profile, particularly amount of amniotic fluid because decreased amniotic fluid is result of decreased kidney perfusion related to decreased fetal oxygen levels

3. Presence of meconium in amniotic fluid

4. Level of anxiety related to delayed date of birth

5. Newborn (e.g., little vernix; long nails and hair; peeling, wrinkled skin; reduced subcutaneous fat; meconium staining)

### **Planning/Implementation**

See Planning/Implementation under Induction or Stimulation of Labor

### **Evaluation/Outcomes**

1. Progresses through labor to safe birth of healthy newborn

2. Remains free from complications

## Dystocia

### **Data Base**

A Dysfunctional or difficult labor

B Mechanical factors: cephalopelvic disproportion; contracted pelvis; malpresentation or position; multiple gestation; occiput posterior position of fetus

C Faulty uterine contractions

1. Hypertonic

a. Increased frequency of contractions with decreased intensity usually in early labor; cervix does not dilate and mother becomes exhausted

b. Older primigravidas or very anxious women at risk

c. Increased fetal molding may cause caput succedaneum or cephalohematoma

2. Hypotonic: slowing of rate and intensity of contractions in latter part of labor

D Maternal complications: cervical trauma, postpartum hemorrhage, infection, and exhaustion

E Shoulder dystocia: head is born, but anterior shoulder cannot pass under pubic arch; caused by feto-pelvic disproportion related to excessive fetal size (>4000 g) or maternal pelvic abnormalities

1. Newborn: may experience asphyxia, birth injuries (e.g., brachial plexus damage, fracture of humerus or clavicle)

2. Mother: may experience blood loss from uterine atony or rupture, trauma (e.g., lacerations, extension of episiotomy), infection (e.g., endometritis)

F Ultrasonography to determine fetal and pelvic size

G Therapeutic interventions

1. Intervention based on length of labor, status of mother and fetus, extent of cervical effacement and dilation, and fetal presentation, position, and station

2. Hypertonic contractions: analgesic and nonpharmacologic strategies to promote rest

3. Hypotonic contractions: oxytocics and nonpharmacologic strategies to stimulate labor

4. Cesarean birth

### **Nursing Care of Women with Dystocia**

### **Assessment/Analysis**

1. Progress of labor

2. Status of mother

3. Status of fetus

### **Planning/Implementation**

1. Relieve back pain caused by prolonged posterior pressure from fetus in occiput posterior position (e.g., apply sacral pressure during contractions; encourage side-lying

position)

2. Observe for signs of maternal exhaustion (e.g., dehydration, acidosis/alkalosis)
3. Monitor for nonreassuring fetal signs
4. Have oxygen, suction, and resuscitation equipment available
5. Provide care related to oxytocin infusion (see [Nursing Care under Induction or Stimulation of Labor](#))
6. Provide emotional support; keep client and family informed about progress
7. Administer fluids as ordered
8. Administer sedatives as prescribed
9. Shoulder dystocia: position mother to facilitate birth (e.g., legs flexed apart with knees on abdomen [McRoberts maneuver], hands-and-knee position [Gaskin maneuver], squatting, lateral recumbent)

## Evaluation/Outcomes

1. Rests/sleeps between contractions and after birth
2. Progresses through labor to safe birth of newborn
3. Remains free from complications

## Precipitate Birth

### ***Data Base***

- A Rapid labor and birth of less than 3 hours' duration
- B Maternal complications: perineal laceration, postpartum hemorrhage
- C Newborn complications: anoxia, intracranial hemorrhage

### ***Nursing Care of Women During Precipitate Birth***

## Assessment/Analysis

1. Rapid cervical dilation
2. Accelerated fetal descent
3. History of rapid labor
4. Rapid uterine contractions with decreased periods of relaxation between contractions

## Planning/Implementation

1. Remain with mother continuously
2. Keep emergency birth pack at bedside
3. Keep mother and partner informed throughout process of labor and birth
4. Support and guide fetal head through birth canal when birth occurs
5. Newborn: establish airway (e.g., position head slightly lower than chest to drain mucus by gravity; rub back to initiate crying)

## Evaluation/Outcomes

1. Mother remains free from injury
2. Newborn remains free from injury

## Breech Birth

### ***Data Base***

A Types of fetal presentation

1. Frank: only buttocks; thighs flexed on hips; knees extended
2. Complete: buttocks and feet; thighs and knees flexed
3. Incomplete: one or both feet (footling) extend below buttocks

B Maternal implication: cesarean birth may be required, especially for primigravida

C Fetal implications

1. Increased mortality
2. Prolapsed cord, leading to asphyxia
3. Birth trauma (e.g., brachial palsy, fracture of upper extremities)

### ***Nursing Care of Women During Breech Birth***

### **Assessment/Analysis**

1. Leopold maneuvers and vaginal examination to identify fetal presentation
2. Auscultation of fetal heart tones above umbilicus
3. Presence of meconium despite fetal well-being; results from contraction of uterus on lower colon of fetus

### **Planning/Implementation**

1. Promote comfort
2. Monitor FHR in an upper quadrant
3. Monitor for prolapsed cord; if it occurs
  - a. With a sterile gloved hand, push presenting part off cord
  - b. Place in Trendelenburg position to keep presenting part away from cord
  - c. Keep prolapsed cord moist with sterile saline
4. Observe for frank meconium
5. Prepare for a forceps-assisted birth if vaginal birth is anticipated
6. Teach mother and partner about process of breech birth
7. Prepare for cesarean birth

### **Evaluation/Outcomes**

1. Mother remains free from injury
2. Newborn remains free from injury

## Cesarean Birth

## **Data Base**

A Birth of infant via abdominal incision; usually transverse incision of lower uterine segment

B Risk factors: cephalopelvic disproportion, dystocia, placenta previa, abruptio placentae, postmaturity, growths within birth canal, multiple births, diabetes, hypertensive disorders, Rh incompatibility, nonreassuring fetal heart pattern, active herpes, and malpresentations (e.g., breech, shoulder); previous cesarean birth

C Vaginal birth after cesarean: an alternative for women who had a transverse uterine incision for a previous cesarean birth

1. Each pregnancy may have different variables that make this attempt possible or impossible
2. Multiple uterine incisions may cause uterine rupture during labor

## ***Nursing Care of Women Before and After Cesarean Birth***

### **Assessment/Analysis**

1. Vital signs
2. Dressing status: intact, presence of bleeding
3. Status of incision: REEDA (no Redness, Edema, Ecchymosis, or Discharge and well Approximated)
4. Fundus and lochia: one or two pads may be saturated during first hour after birth; usually less than after a vaginal birth
5. Urinary output: amount; specific gravity; presence of blood
6. Neurovascular status following regional anesthesia
7. Presence of pain
8. Response to neonate

### **Planning/Implementation**

1. Provide preoperative care
  - a. Ensure consent is signed; keep client and partner informed
  - b. Obtain specimens for laboratory tests
  - c. Prepare for surgery (e.g., arrange for operating room, insert urinary catheter)
2. Provide postoperative care
  - a. Monitor vital signs, fundal height and tone, abdominal incision
  - b. Maintain IV infusion of oxytocin if prescribed
  - c. Administer analgesics as prescribed
  - d. Promote lung aeration (e.g., deep breathing and coughing, incentive spirometer)
  - e. Maintain fluid and electrolyte balance; monitor I&O
  - f. Encourage early ambulation to prevent circulatory stasis and promote peristalsis
  - g. Encourage eating solid foods to promote peristalsis (prevents distention) when bowel sounds have returned
3. Assist with parent and newborn bonding and attachment; encourage touching; include

father in process; offer emotional support

4. Support early breastfeeding if desired

## Evaluation/Outcomes

1. States relief from pain

2. Maintains urinary and fecal elimination

3. Remains free from complications

4. Parents demonstrate attachment behaviors with newborn

## Assisted Birth

### ***Data Base***

A Device is used to shorten second stage of labor and facilitate birth

B Assistive devices

1. Forceps: instrument applied to fetus' head or presenting part, allowing health care provider to control the birth; indicated for ineffective pushing, malposition, large infants, and women with heart disease

2. Vacuum extraction: cup is placed on fetus' head or presenting part; applied suction promotes descent; newborn may develop caput succedaneum, but is otherwise unharmed

### ***Nursing Care of Women During and After Assisted Births***

See [Nursing Care of Women with Complications during the Intrapartum Period](#) and [Nursing Care of Women with Complications during the Postpartum Period](#)

# Nursing Care of Women with Complications During the Postpartum Period

## Postpartum Bleeding

### **Data Base**

A Bleeding in excess of 500 mL within first 24 hours following birth

B Risk factors: uterine atony; vaginal, cervical, and perineal lacerations; hematomas; retained placental fragments; multifetal pregnancy; numerous previous pregnancies; (bleeding increases risk of infection)

1. Uterine atony: caused by overdistention of uterus; prolonged labor, birth trauma, grand multiparity
2. Classification of lacerations
  - a. First-degree: superficial, extends through perineal skin and vaginal epithelium
  - b. Second-degree: extends through perineal muscles; episiotomies are second degree
  - c. Third-degree: extends partially or totally through fibers of the external and/or internal anal sphincters
  - d. Fourth-degree: extends through anterior rectal wall
3. Hematomas: in perineum, vagina, uterus; caused by increased fundal pressure by fetus, forceps, or manipulation
4. Placental abnormalities: can cause life-threatening hemorrhage
  - a. Placenta accreta: chorionic villi adhere to uterine myometrium
  - b. Placenta increta: chorionic villi invade myometrium
  - c. Placenta percreta: chorionic villi invade and pass through the myometrium to peritoneal covering

### C Clinical findings

1. Excessive frank, red bleeding
2. Boggy uterus; uterus above umbilicus
3. Hypotension
4. Disseminated intravascular coagulopathy (DIC)
  - a. Profuse, uncontrollable bleeding from uterus
  - b. Oozing of blood from episiotomy, laceration, or IV site
  - c. Fragmented or distorted RBCs
  - d. Decreased coagulation factors (pathologic form of clotting)

### D Therapeutic interventions

1. Maintenance of empty bladder
2. Massage of fundal portion of uterus
3. Administration of oxytocics
4. Replacement of blood if severe blood loss
5. Surgical repair of lacerations
6. Removal of retained placental fragments
7. Cryoprecipitate, fresh frozen plasma for DIC

# ***Nursing Care of Women with Postpartum Bleeding***

## **Assessment/Analysis**

1. History of multiparity; prolonged labor; analgesia; multiple gestation; abruptio placentae or placenta previa; hypertensive disorders, especially HELLP syndrome
2. Vaginal bleeding with clots
3. Uterus for tone (firm, boggy)
4. Urinary output for decrease
5. Vital signs
6. Results of blood studies
7. Clinical manifestation of shock; anemia
8. Level of anxiety

## **Planning/Implementation**

1. Monitor vital signs
2. Assess fundus for height and firmness every 15 minutes; if boggy massage until firm
3. Monitor bleeding (e.g., number of perineal pads, presence of clots)
4. Administer oxytocic as prescribed
5. Encourage emptying bladder to prevent distension, which interferes with uterine contraction; insert indwelling catheter as ordered if voiding is insufficient; monitor I&O
6. Prepare for ultrasonography if retained placental fragments are suspected
7. Maintain NPO in case surgical intervention becomes necessary
8. Prepare for blood transfusions or emergency surgery if condition worsens

## **Evaluation/Outcomes**

1. Demonstrates hemodynamic stability
2. Remains free from complications

## **Episiotomy**

### ***Data Base***

- A Incision into perineum to facilitate birth, prevent lacerations and overstretching of pelvic floor usually on perineum between vaginal introitus and rectum; may be midline or mediolateral
- B Closed surgically; usually performed under regional anesthesia
- C More painful, more difficult to repair, and causes more perineal trauma and infection than repair of lacerations

## ***Nursing Care of Women after an Episiotomy***

## **Assessment/Analysis**

1. Clinical manifestations of REEDA
2. Extent of pain
3. Signs of hematoma

## **Planning/Implementation**

1. Apply cold to perineum if ordered (limits edema during first 12 to 24 hours)
2. Provide and teach perineal care, including when to change pads
3. Administer prescribed analgesics; may be systemic and/or local
4. Provide sitz baths if ordered; promotes dilation of blood vessels, increases blood to area, facilitates healing
5. Teach perineal exercises (Kegel)

## **Evaluation/Outcomes**

1. States relief from pain
2. Remains free from infection

# CHAPTER 27

# Nursing Care of the Newborn

---

# Foundations of Nursing Care for Newborns

## Family and Prenatal History

- A Chronic illness in mother's or father's family
- B Previous maternal and paternal illnesses
- C Ages and present health status of parents
- D History of previous pregnancies
- E Prenatal history
  - 1. Supervision during pregnancy
  - 2. Nutrition during pregnancy
  - 3. Duration of gestation
  - 4. Course of pregnancy
    - a. Medications; antibiotics if positive for group beta streptococcus (GBS)
    - b. Illnesses; infections, including sexually transmitted infections
    - c. Ingestion of alcohol, drug use, smoking
    - d. Sedation; analgesia; anesthesia
  - 5. Type of birth; significant events during initial minutes after birth
  - 6. Newborn responses to birth (Apgar score at 1 and 5 minutes following birth)

## Parent-Infant Relationships

- A Concepts basic to parent-infant relationships
  - 1. Early, frequent parent-infant contact essential for attachment (bonding)
  - 2. Developmental stages
    - a. Biologic changes at puberty and during pregnancy influence development of nurturance
    - b. Interaction between mother and infant begins from moment of conception; can be shared with father
    - c. Childbearing; parenting abilities can be fostered and developed
    - d. Childrearing: parental behavior is learned; frequent parent-infant contact enhances parenting abilities; ambivalence is natural phenomenon as are feelings of resentment
  - 3. Development of parent-infant love
    - a. Love for infant grows as parents interact and give care
    - b. As parent gives to infant and infant accepts, parent in turn receives satisfaction from parenting tasks
    - c. Disturbance in give-and-take cycle initiates frustrations in parents and infant
- B Infant's basic needs
  - 1. Physiologic: food, clothing, hygiene, and protection from environment
  - 2. Emotional: security, comfort, fondling, caressing, rocking, verbalizing, consistent contact with caregiver
- C Basis for parenting

1. Biologic inborn desire to reproduce
2. Role concepts that begin with own childhood experiences
3. Primitive emotional relationships

#### 4. Level of maturity

### D Parent-infant relationships influences

1. Readiness for pregnancy
  - a. Planned or unplanned
  - b. Health status before pregnancy
  - c. Determinants: age, cultural backgrounds, number in family unit, financial status
2. Nature of pregnancy
  - a. Health status during pregnancy
  - b. Preparation for parenthood
  - c. Support from family members and health care team
3. Characteristics of labor and birth
  - a. Length and pattern of labor; type of birth
  - b. Type and amount of analgesia/anesthesia received
  - c. Support from family and health team
4. Factors that impede attachment
  - a. Impaired physical status of newborn and/or mother
  - b. Treatments that interfere with attachment
  - c. Disturbance related to idealized image of infant

### E Reva Rubin Significant Phases of Maternal Adjustment

1. Taking-in phase: mother's needs must be met before she can meet infant's needs; talks about self rather than infant; may not touch infant; cries easily; integrates birth experience into reality
2. Taking-hold phase: mother starts to assume responsibility for her infant; lasts from day 2 to day 10; concerned about infant, interested in learning; teachable, reachable, and referable at this time
3. Letting-go phase: mother discards idealized notion of childbirth; may have periods of guilt or grief over childbirth experience

### F Supportive care to promote attachment

1. Allow time to inspect and identify with infant; encourage parents to touch, fondle, and hold infant
2. Encourage interaction between parents and infant
3. Teach about characteristics of newborn; demonstrate infant care to help parents learn how to meet infant's and their own needs
4. Evaluate parents' and infant's responses; revise plan as necessary; identify disturbed relationships
5. Provide therapeutic environment for various family lifestyle types: nuclear, single parent, gay, blended

## Adaptation to Extrauterine Life

A Immediate care at time of birth

- 1. Aspirate mucus to provide an open airway
- 2. Evaluate with Apgar score 1 and 5 minutes following birth
  - a. Score determined by points for heart rate (most critical), respiration, muscle tone, reflex irritability, and color (Table 27-1: Apgar Score)

Table 27-1  
Apgar Score

Sign	Score		
	0	1	2
Heart rate (bpm)	Absent	Slow (<100)	>100
Respiratory rate	Absent	Slow, weak cry	Good cry
Muscle tone	Flaccid	Some flexion of extremities	Well flexed
Reflex irritability	No response	Grimace	Cry
Color	Blue, pale	Body pink, extremities blue	Completely pink

(From Lowdermilk DL, Perry SE: *Maternity and women's health care*, ed 10, St. Louis, 2012, Mosby.)

- b. Scores: 7 to 10, good condition; 3 to 6, moderately depressed; 0 to 2, severely depressed; lower scores related to high neonatal morbidity and mortality with need for resuscitative interventions
- 3. Dry infant and place in skin-to-skin contact with mother or under radiant warmer to maintain body temperature
- 4. Perform newborn assessment
- 5. Promote interaction between parents and newborn
- 6. Identify by applying matching identification bands to infant and mother; may include father and significant others
- 7. Provide prophylactic eye care; instill prescribed antibiotic (e.g., erythromycin) in each eye to prevent ophthalmia neonatorum caused by gonorrhea or chlamydia infection
- 8. Administer vitamin K (intramuscularly (IM) in United States, orally in Canada) to prevent hemorrhage
- 9. Obtain heel-stick blood specimen for laboratory tests to assess adaptation to extrauterine life and presence of congenital conditions; use outer aspect of heel to prevent lancet penetration of bone (Figure 27-1: Heel-stick sites)

**FIGURE 27-1** Heel-stick sites. (From Lowdermilk DL, Perry SE: *Maternity and women's health care*, ed 10, St. Louis, 2012, Mosby.)

## B Behavioral characteristics during transition period

1. First stage (period of reactivity)
  - a. Lasts 0 to 30 minutes
  - b. Alert and moving
  - c. Gustatory movements
  - d. Heart rate: 160 to 180 beats/min for 15 minutes; declines to baseline of 100 to 120 beats/min
  - e. Respirations: 40 to 60 breaths/min; abdominal; irregular; grunting, flaring of nostrils; intermittent chest retractions
2. Second stage (period of decreased responsiveness)
  - a. Lasts 30 minutes to 2 hours
  - b. Relaxation and rest
  - c. Heart rate between 100 and 120 beats/min
  - d. Respirations: rapid, shallow, synchronous; chest shape gradually changes to increase anterior-posterior diameter
  - e. Audible bowel sounds
3. Third stage (second period of reactivity)
  - a. Lasts 2 to 8 hours
  - b. Increased responsiveness to stimuli
  - c. Cardiac and respiratory rates may increase
  - d. Changes in color and muscle tone
  - e. Bowel sounds more frequent; may pass meconium

## C Characteristics and changes during first week of life

1. Circulatory
  - a. Changes in fetal circulation after umbilical cord is clamped
    - (1) Foramen ovale closes

- (2) Ductus arteriosus closes; becomes ligamentum arteriosum
  - (3) Umbilical arteries obliterate
  - (4) Circulation becomes similar to adult within 1 hour after birth
- b. Heart rate regular; 100 to 160 beats/min; variable depending on infant's activity; soft heart murmur common for first month of life
- c. Clotting mechanism inadequate because intestinal bacteria necessary for synthesis of prothrombin are lacking; exogenous vitamin K needed
- d. Liver large but immature; cannot destroy large number of red blood cells (RBCs) that consist of fetal hemoglobin, resulting in physiologic jaundice by third day
- e. Hemoglobin 14 to 20 g/100 mL; fetal hemoglobin replaced by adult form in 6 weeks
- f. White blood cell (WBC) count high; 6000 to 22,000/mm<sup>3</sup>
- 2. Respiratory: 40 to 60 breaths/min during first 2 hours after birth, then 30 to 50 breaths/min; irregular rate; abdominal excursions
- 3. Temperature: maintained at 97.8° F to 98° F (36.6° C to 36.7° C); environment may cause fluctuations
- 4. Excretory
  - a. Stools
    - (1) Meconium: first 2 days; black-green; tenacious,
    - (2) Transitional: by third day; mixes with milk stool; green-yellow
  - b. Urine
    - (1) Kidneys immature
    - (2) Voids in first 24 hours; voids 20 times daily at 2 weeks of age
    - (3) Contains albumin and urates during first week causing brick-red staining on diaper
- 5. Integumentary
  - a. Lanugo: fine, downy hair growth over entire body; preterm infants have more lanugo
  - b. Vernix caseosa; whitish cheesy substance covers body; more abundant in creases; more in preterm infant and less in postterm infant
  - c. Milia: small, whitish, pinpoint spots over nose caused by retained sebaceous secretions that resolve within a month
  - d. Mongolian spots: blue-black discolorations on back, buttocks, and sacral region that disappear by first year; common on dark-skinned infants
  - e. Telangiectatic nevi (stork bites): pink or red areas caused by capillary dilation
- 6. Digestive
  - a. Fetus stores nutrients toward end of third trimester; needs little nourishment during first few days
  - b. Rooting and sucking reflexes active at birth
  - c. Simple carbohydrates, fats, and proteins readily digested
  - d. Inadequately developed cardiac sphincter; regurgitation after feeding
  - e. Swallowing of air when suckling requires being burped during and after feedings
  - f. Gastric acidity is low for 2 to 3 months

## 7. Metabolic

- a. Attempts to maintain body temperature by flexion of extremities, breaking down of brown fat, and vasoconstriction
- b. Loses 5% to 10% of body weight by first week of life
- c. Needs screening for inborn errors of metabolism
  - (1) Phenylketonuria (PKU) testing done 24 to 48 hours after first feeding; test may be done earlier with repeat test at first follow-up visit; infants with excess phenylalanine require special low phenylalanine diet to prevent mental retardation
  - (2) Thyroxine ( $T_4$ ) screening; inadequate thyroxine without replacement therapy leads to cretinism
  - (3) Lactose intolerance; requires nonmilk formula
- d. Hypoglycemia
  - (1) Caused by inadequate glycogen reserve
  - (2) Clinical findings: jitteriness, temperature and respiratory instability
  - (3) Risk factors: small for gestational age (SGA), large for gestational age (LGA), infants of diabetic mothers (IDM), birth trauma, congenital anomalies, endocrine disorders (e.g., hyperinsulism, hypopituitarism, hypothyroidism)

## 8. Endocrine

- a. Related to hormones transmitted by mother
- b. Males: breast enlargement (gynecomastia); edematous scrotum
- c. Females: breast enlargement; secretion from nipples (witch's milk); edematous labia; blood-tinged vaginal discharge (pseudomenstruation)

## 9. Neural

- a. Immature central nervous system (CNS) and brain; most responses are reflexive
- b. Early neural activities: breathing, sucking, crying; necessary for survival

## 10. Sleep

- a. Lowers body metabolism
- b. Helps restore energy and assimilate nutrients for growth

## 11. Habituation: psychologic or physiologic phenomenon whereby neonate's response to a repetitive stimulus decreases; promotes environmental selectivity and learning

## D Nutrition

1. Infant feeding: put to breast or given formula soon after birth; simple proteins, carbohydrates, fats, vitamins, and minerals needed for continued cell growth
  - a. Fluid: 130 to 200 mL/kg or 2 to 3 oz/lb of body weight
  - b. Calories: 110 to 130 calories/kg or 50 to 60 calories/lb of body weight
  - c. Protein: 2.0 to 2.2 g/kg of body weight from birth to 6 months of age; 1.8 g/kg of body weight from 6 to 12 months of age
2. Self-regulation schedule
  - a. Varying degrees of maturity, nutrition needs, and body rhythms
  - b. Schedule modified to meet needs of infant and parents
  - c. Formula-fed infants fed on demand or about every 4 hours

- d. Breastfed infants fed on demand, approximately every 2 to 3 hours
- e. Feeding behavior and degree of satisfaction influence psychologic development
- f. Close mother/father-infant relationship during feeding process meets basic need of trust (Erikson's stage of trust versus mistrust)

#### E Newborn immunity

1. Passive immunity in utero: immunoglobulin G (IgG) passes from mother to fetus through placenta
2. Active immunity in utero: fetus produces immunoglobulin M (IgM) by end of first trimester
3. Passive immunity after birth: immunoglobulin A (IgA) passes from mother to infant through colostrum, the precursor to breast milk

### ***Nursing Care Common to All Newborns***

#### **Assessment/Analysis**

1. Gestational age
  - a. Preterm: birth at less than 37 completed weeks' gestation
  - b. Term: birth between the 37th and 42nd week of gestation
  - c. Postterm (postmature): birth after 42 weeks' gestation; subjected to effects of progressive placental insufficiency and diminished amniotic fluid
  - d. Gestational age assessment: new Ballard scale determines gestational age of very low birth weight infants as well as at term. ([Figure 27-2](#): Neuromuscular maturity and physical maturity)

## NEUROMUSCULAR MATURITY

	-1	0	1	2	3	4	5
Posture							
Square Window (wrist)							
Arm Recoil							
Popliteal Angle							
Scarf Sign							
Heel to Ear							

## PHYSICAL MATURITY

Skin	sticky friable transparent	gelatinous red, translucent	smooth pink, visible veins	superficial peeling or rash, few veins	cracking pale areas rare veins	parchment deep cracking no vessels	leathery cracked wrinkled
Lanugo	none	sparse	abundant	thinning	bald areas	mostly bald	
Plantar Surface	heel-toe 40-50 mm: -1 <40 mm: -2	>50 mm no crease	faint red marks	anterior transverse crease only	creases ant. 2/3	creases over entire sole	
Breast	imperceptible	barely perceptible	flat areola no bud	stippled areola 1-2 mm bud	raised areola 3-4 mm bud	full areola 5-10 mm bud	
Eye/Ear	lids fused loosely: -1 tightly: -2	lids open pinna flat stays folded	sl. curved pinna; soft; slow recoil	well-curved pinna; soft but ready recoil	formed & firm instant recoil	thick cartilage ear stiff	
Genitals (male)	scrotum flat, smooth	scrotum empty faint rugae	testes in upper canal rare rugae	testes descending few rugae	testes down good rugae	testes pendulous deep rugae	
Genitals (female)	clitoris prominent labia flat	prominent clitoris small labia minora	prominent clitoris enlarging minora	majora & minora equally prominent	majora large minora small	majora cover clitoris & minora	

## MATURITY RATING

**FIGURE 27-2** Neuromuscular maturity and physical maturity. (From Ballard J, et al: *New Ballard score, expanded to include extremely premature infants*. J Pediatrics, 119: 417-423, 1991.)

## 2. Birth weight

- Appropriate for gestational age (AGA): between 10th and 90th percentile (between 6 and 8.5 lb)
- Large for gestational age (LGA): above 90th percentile
- Small for gestational age (SGA): below 10th percentile
- Low birth weight (LBW): less than 2500 g (6 lb)
- Very low birth weight (VLBW): less than 1500 g (3.5 lb)
- Extremely low birth weight: less than 1000 g (2.2 lb)
- Intrauterine growth restriction (IUGR): fetal growth rate below expected range for gestational age

## 3. Skin

- a. Body: pink with cyanosis of hands and feet (acrocyanosis); jaundice during first 24 hours is sign of pathology
- b. Markings: abrasions, rashes, crackling, birthmarks, forceps marks, ecchymosis, papules
- c. Turgor: elasticity indicates adequate tissue hydration
4. Vital signs: moves from least to most invasive
  - a. Respirations, heart rate, temperature
  - b. Respirations: abdominal and irregular; 40 to 60 breaths/min during first 2 hours; then 30 to 50 breaths/min retractions with sternal depression indicate pathology
  - c. Heart rate: 100 beats/min at rest, 180 beats/min when crying; more than 160 beats/min at rest indicates cardiac disorder
  - d. Temperature: 97.7° F to 98.9° F
5. Head and sensory organs
  - a. Head and chest circumference: nearly equal with chest slightly smaller than head; if reversed, indicates microcephaly; if head is more than 1 inch (2 to 3 cm) larger than chest it indicates hydrocephaly
  - b. Fontanel: flat; bulging when crying; bulging at rest indicates increased intracranial pressure; sunken indicate dehydration
  - c. Symmetry of face: sides of face should move equally when crying
  - d. Characteristics of head: molding, abrasions, or skin breakdown; caput succedaneum (edema of soft tissue of scalp); cephalohematoma (edema of scalp caused by effusion of blood between skull bone and periosteum)
  - e. Neck: adequacy of range of motion indicated by full head movement in all directions when extended; head lags as infant is raised
  - f. Eyes: discharge or irritation, pupils for reaction to light, equality of eye movements (usually some ocular incoordination), sclerae for clarity, jaundice, or hemorrhage
  - g. Nose: patency of both nostrils; frequent sneezing in an attempt to clear mucus from nose
  - h. Mouth: color and continuity of gums and hard and soft palates; white patches that bleed on rubbing indicate thrush, a monilial infection
  - i. Ears: auricles open; vernix covers tympanic membrane, response when bell is rung close to ear; both eyes at same level as ears (ears lower than eyes indicate congenital anomaly); upper earlobes curved (flatness indicates kidney anomaly)
6. Chest and abdomen
  - a. Chest auscultation: respiratory sounds audible (noisy crackling sounds are unexpected); regular heart rate
  - b. Breasts and nipples: edematous; witch's milk is response to maternal hormone stimulation
  - c. Abdomen
    - (1) Bowel sounds over abdomen
    - (2) Spleen: tip should be palpable by fingertips under left costal margin
    - (3) Liver: palpation on right side; 1 cm below costal margin
    - (4) Umbilical cord: redness, odor, or discharge; contains one vein and two arteries

(two vessels or 2 veins and 1 artery indicate congenital anomalies)

(5) Umbilical hernia when crying

(6) Femoral pulses: gentle palpation at inner aspect of groin; pulses indicate intact circulation to extremities

## 7. Genitalia

### a. Males

(1) Testes in scrotum: palpable; one or both may be undescended in preterm infants and some full-term newborns; usually descend during childhood; must descend by puberty or sperm are destroyed by high temperature in abdominal cavity

(2) Scrotum: edematous; enlargement indicates hydrocele and diagnosis confirmed by transparent appearance of scrotum when flashlight is held close to scrotal sac (transillumination)

(3) Penis: urinary meatus at tip; meatus on upper surface of penis (epispadias); meatus on lower surface (hypospadias)

(4) Voiding pattern, frequency

### b. Females

(1) External: labia, urinary meatus, and vaginal opening

(2) Labia: edema,

(3) Vagina: bloody mucoid discharge response to maternal hormones

(4) Voiding frequency

c. Ambiguous genitalia: unclear identification of gender; studies needed to determine gender (e.g., genetic, surgical procedure)

## 8. Extremities

a. Hands and arms: thumbs clenched in fist; wrist angle is 0 degrees at term

(1) Fingers: number and variation

(2) Movement of clavicles and scapulae while putting arms through range of motion: clicking or resistance indicates dislocation or fracture

(3) Fractures; indicated by crepitation

### b. Feet and legs

(1) Toes: appearance and number

(2) Adduction and abduction of feet during range of motion: resistance or tightness indicate need for further assessment

(3) Flexion of both legs onto lower abdomen with abduction of knees: click (Ortolani sign) indicates developmental dysplasia of hip (DDH)

(4) Feet placed on flat surface with bent knees: knees of unequal height (Allis sign) indicates DDH

(5) Symmetry of gluteal folds; asymmetry indicates DDH

9. Back: dimples, separations, or swellings along spinal column indicates spina bifida

10. Anus: patency confirmed with passage of meconium; imperforate anus ruled out by digital examination

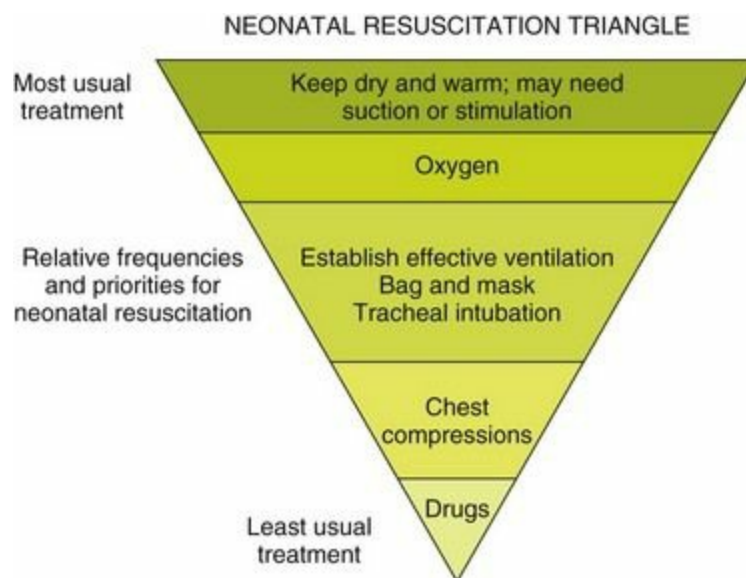

11. Neuromuscular development: reflexes

a. Rooting: when cheek is touched with finger, head turns to search for finger; may persist for up to 1 year

- b. Sucking: object close to mouth elicits sucking movements; persists throughout infancy
- c. Gag: stimulation of posterior pharynx causes choking; helps prevent aspiration; persists through life
- d. Grasp: pressure on palm (palmar) or on sole of foot below toes (plantar) elicits flexion; palmar lessens by 3 months, plantar by 8 months
- e. Babinski: when outer undersurface of foot is stroked in an arc toward inner undersurface, toes separate and flare out; disappears after 1 year
- f. Moro (startle): sudden jar, noise, or change in equilibrium causes extension and abduction of extremities, followed by flexion and adduction into embrace position; may cry out; disappears by 3 to 4 months
- g. Crawl: when in prone position on firm surface, crawling movements are elicited; disappears at about 6 weeks
- h. Step or dance: when supported under both arms with feet on firm surface, stepping movements are elicited; disappears after 3 to 4 weeks
- i. Tonic neck (fencing): when in supine position, arm and/or leg on side to which head is turned extends with flexion of contralateral limbs; usually disappears by 3 to 4 months

## Planning/Implementation

1. Monitor and maintain patent airway ([Figure 27-3: Neonatal resuscitation triangle](#))

**FIGURE 27-3** Neonatal resuscitation triangle. (From Hamilton P: *ABCs of labor care: care of the newborn in the delivery room*, Br Med J 318:1403-1406, 1999.)

- a. Suction mucus as needed
  - b. Place head in side-lying position to facilitate drainage of mucus
  - c. Observe for signs of respiratory distress: grunting, flaring of nostrils, sternal retractions
  - d. Observe for signs of aspiration during first feeding (e.g., choking, cyanosis); stop feeding, suction airway, and administer oxygen before resuming feeding
2. Provide warmth

- a. Keep in radiant warmer using a surface temperature probe until body temperature is stabilized to prevent chilling; infant is unable to shiver and breaks down brown fat to produce energy for warmth; preterm or SGA infants can be compromised by chilling because of small amount of brown fat available for breakdown
- b. Dress in loose, soft clothing
- c. Maintain warm, draft-free environment
- d. Keep skin clean and dry
3. Monitor vital signs, weigh daily
4. Provide daily sponge bath, change diaper frequently
5. Provide care of umbilical cord stump
  - a. Observe for edema, redness, drainage
  - b. Adhere to hospital protocol; clamp usually removed before discharge
  - c. Keep dry, secure diaper below level of cord
  - d. Teach parents to sponge bathe until cord falls off
6. Provide care of penis
  - a. Circumcision
    - (1) Observe for bleeding, monitor urination
    - (2) Apply diaper loosely
    - (3) Change dressing with each diaper change or at least every 4 hours and apply petrolatum to glans
    - (4) Teach care to parents if appropriate
  - b. No circumcision: bathe daily, do not retract foreskin
7. Administer vitamin K to prevent hemorrhage
8. Administer hepatitis B (Hep B) vaccine; Centers for Disease Control and Prevention mandate that newborns receive vaccine regardless of mother's status
9. Administer prophylactic ophthalmic antibiotic to prevent ophthalmia neonatorum
10. Provide for feeding (see [Breastfeeding](#) and [Formula Feeding \[Bottle Feeding\]](#))
11. Teach infant care to parents; act as role model for acceptance regardless of newborn's physical characteristics or behavior
12. Allow time for contact with parents (e.g., touching, talking, rocking, singing)

## Evaluation/Outcomes

1. Maintains patency of the airway
2. Stabilizes body temperature within acceptable range
3. Urinates amounts commensurate with fluid intake
4. Passes stool
5. Maintains 90% of birth weight
6. Remains free from complications associated with the perinatal period

## Breastfeeding

### Data Base

## A Advantages

1. Psychologic value of closeness and satisfaction in beginning mother-infant relationship
2. Optimum nutritional value
3. Economical and readily accessible
4. Fewer allergies
5. Aids in development of facial muscles, jaw, and nasal passages because stronger sucking is necessary
6. Promotes involution of uterus because it stimulates oxytocin secretion that initiates let-down reflex
7. Reduces risk for infection because of maternal antibodies in colostrum and milk
8. Stimulates evacuation of meconium because of frequent feeding; helps prevent reabsorption of bilirubin into circulation

## B Prerequisites

1. Psychologic readiness of mother is major factor for successful breastfeeding
2. Adequate diet to ensure high-quality milk; increased intake of milk, protein, calories, and noncaffeinated fluids
3. Motivation to allow time for rest and exercise
4. Adequacy of infant's sucking force; stimulates maternal production and release of oxytocin into circulation; oxytocin causes constriction of lactiferous sinuses to move milk down through nipple ducts (let-down reflex)
5. Family support; minimum maternal emotional stress (anxiety inhibits let-down reflex)

## C Contraindications

1. Mother
  - a. Illnesses: active tuberculosis; acute contagious disease; HIV positive; chronic disease (e.g., cancer, advanced nephritis, cardiac disease, hepatitis); extensive surgery
  - b. Opioid addiction
  - c. Prescription, over-the-counter (OTC) drugs, and supplements: excreted in breast milk; may have harmful effects; must be avoided or taken judiciously, if necessary; requires careful monitoring of infant
2. Infant
  - a. Any condition that interferes with or prevents grasping the nipple (e.g., cleft lip or palate, other congenital anomalies)
  - b. Inadequate sucking force (e.g., prematurity, cardiac problems)
  - c. Inborn errors of metabolism that result in negative response to breast milk (e.g. PKU, lactose intolerance)

## ***Nursing Care of the Breastfeeding Mother and Infant***

### **Assessment/Analysis**

1. Condition of nipples
2. Desire to breastfeed

3. Level of anxiety and concerns regarding breastfeeding
4. Knowledge of breastfeeding and breast care
5. Family support

## Planning/Implementation

1. Teach feeding techniques
  - a. Mother and infant in comfortable position, semireclining or in comfortable chair
  - b. Entire body of infant turned toward mother's breast; alternate starting breast; use both breasts at each feeding
  - c. Initiate feeding by stimulating rooting reflex; direct nipple straight into infant's mouth; ensure areola is in infant's mouth to promote latching-on ([Figure 27-4](#): Correct attachment [latch-on] of infant at breast)

**FIGURE 27-4** Correct attachment (latch-on) of infant at breast. (From Lowdermilk DL, Perry SE: *Maternity and women's health care*, ed 9, St. Louis, 2007, Mosby.)

- d. Burp infant during and after feeding to allow for escape of air: sit infant on lap, flexed forward; rub or pat back, while avoiding jarring
2. Teach care of breasts
    - a. Cleanse with plain water once daily (soap or alcohol can cause irritation and dryness)
    - b. Allow nipples to air dry at intervals; avoid plastic bra liners because they increase heat and perspiration and decrease air circulation necessary for keeping nipples dry
    - c. Wear brassiere that supports breasts day and night
    - d. Place nursing pads inside bra cup to absorb milk leaking between feedings
    - e. If breasts are engorged, take warm showers, apply cold packs between feedings,

and put infant to breast more frequently

### 3. Teach feeding schedule

- a. Self-demand schedule is desirable; infant usually self-regulates to a schedule of every 2 to 3 hours
- b. Length of feeding time is variable; about 15 to 20 minutes per breast, with greatest quantity of milk consumed in first 5 to 10 minutes
- c. Feed more often if lactation diminishes to stimulate increased milk production

### 4. Provide information about frequently asked questions

- a. Breast milk intake similar to formula intake: 130 to 200 mL of milk/kg (2 to 3 oz of milk/lb) of infant's weight; from one sixth to one seventh of infant's weight per day
- b. After lactation is established, occasional formula feeding can be substituted, but is not recommended; breast milk can be expelled manually
- c. Length of time for continuing breastfeeding is variable

### Evaluation/Outcomes

1. Mother demonstrates effective breastfeeding techniques
2. Mother remains free from nipple cracking and infection
3. Infant produces six or more wet diapers daily
4. Infant gains weight

## Formula Feeding (Bottle Feeding)

### **Data Base**

#### A Advantages

1. Alternative to breastfeeding
2. Less restrictive than breastfeeding; may meet needs of working mothers
3. Accurate assessment of intake
4. Required for infant with congenital anomaly (e.g., cleft lip, cleft palate)
5. Required for infant needing special formula (e.g., allergies, inborn errors of metabolism)

#### B Types of formulas

1. Commercial liquid or powdered formulas
2. Special formulas
3. Unmodified cow's milk, liquid or reconstituted: not appropriate for infants before 12 months of age; contains more protein and calcium than breast milk; contains less vitamin C, iron, and carbohydrate than breast milk

#### C Contraindications

1. Deficient knowledge of formula preparation and maintaining asepsis
2. Poor storage and refrigeration
3. Contaminated water supply
4. Cost of formula and equipment
5. Lack of equipment to adequately prepare bottles

# ***Nursing Care of the Formula-Feeding Parents and Infant***

## **Assessment/Analysis**

1. Desire to formula feed
2. Sucking ability of infant
3. Knowledge of different formulas, their advantages and disadvantages
4. Ability to prepare formula

## **Planning/Implementation**

1. Teach preparation of formula
  - a. Calculate formula to yield 110 to 130 calories and 130 to 200 mL of fluid/kg of body weight; caution regarding dangers of overdilution (inadequate weight gain) and underdilution (excess weight gain)
  - b. Sterilize formula by terminal heat or aseptic method
  - c. Keep formula refrigerated
2. Teach feeding techniques
  - a. Hold infant during feeding to provide warm body contact; bottle propping can contribute to aspiration of formula
  - b. Hold bottle so that nipple is filled with milk to prevent excessive air ingestion
  - c. Adjust size of nipple hole according to infant's suckling ability; preterm infants and those with cardiac defects need a larger hole that requires less intense sucking
  - d. Burp during and after feeding; prop infant on right side after feeding to aid digestion and prevent aspiration
3. Inform parents why feedings should be offered on demand to meet infant's needs

## **Evaluation/Outcomes**

1. Parents demonstrate effective preparation of formula
2. Parent's demonstrate effective formula-feeding techniques
3. Infant produces six or more wet diapers daily
4. Infant gains weight

# Nursing Care of High-Risk Newborns

## Preterm Infant

### **Data Base**

A Classification based on gestational age with consideration of birth weight; full-term infant may be of low birth weight (IUGR), preterm infant may not be low birth weight (infant of diabetic mother [IDM])

1. Near-term: 35 to 37 weeks
2. Preterm: 36 weeks or less
3. Low birth weight: less than 2500 g
4. Very low birth weight: less than 1500 g
5. Extremely low birth weight: less than 1000 g; may be both preterm and small for gestational age
6. Stillborn: fetus of 20 or more weeks' gestation who dies before or during birth

B Incidence: preterm births account for 75% to 85% of neonatal morbidity and mortality

C Risk factors

1. Preconception disorders: diabetes; incompetent cervical os
2. Postconception disorders: preeclampsia; pyelonephritis; placenta previa; abruptio placentae
3. Maternal malnutrition: associated with higher preterm birth rates and intrauterine growth restriction (IUGR)
4. Age: adolescent
5. Destructive lifestyle: drug use, smoking, unprotected sex

D Prevention

1. Correction or control of preconception disorders, if possible
2. Preconception and continued education about nutrition
3. Education about hazards of destructive lifestyle; support to change behavior
4. Early and regular prenatal health supervision
5. Referrals to community agencies to facilitate services for those in need

E Therapeutic interventions immediately after birth

1. Suctioning of mucus to maintain open airway
2. Direct laryngoscopy, tracheal suctioning, intubation, and mouth-to-tube resuscitation to initiate respirations
3. Suctioning of stomach contents to facilitate respirations
4. Maintenance of body temperature using radiant warmer; difficult because of heat loss through skin evaporation and limited subcutaneous fat
5. Oxygenation and resuscitation as needed

F Characteristics

1. Skin
  - a. Wrinkled because of minimum subcutaneous fat
  - b. Transparent with visible blood vessels and bony structures

- c. Lanugo on face and body; absent eyebrows
- d. Color changes with movement; upper half or one side of body pale, lower half or one side of body red (harlequin sign)

## 2. Head

- a. Circumference large compared to chest
- b. Small fontanelles
- c. Skull bones soft; prone to intracranial hemorrhage
- d. Ear cartilage soft; cannot support ear pinna

## 3. Chest: small breast buds; underdeveloped nipples

## 4. Posture: complete relaxation with marked extension of legs and abduction of hips

## 5. Extremities: random movements with slightest stimulus; square window sign

## 6. Central nervous system: underdeveloped

- a. Heat regulation center: heat loss caused by large body surface area, lack of subcutaneous and brown fat, lack of shivering
- b. Insufficient heat production: inadequate metabolism
- c. Respiratory center: diminished oxygen consumption causing asphyxia

## 7. Respirations

- a. Inefficient respirations caused by muscle weakness of rib cage and limited surfactant production; prone to atelectasis
- b. Retraction at xiphoid (evidence of air hunger)

## 8. Circulation

- a. Weak heart action slows circulation with inadequate oxygenation
- b. Capillary fragility; low RBC and WBC counts; anemia during first few months of life

## 9. Nutrition

- a. Weak sucking and swallowing reflexes
- b. Small capacity of stomach
- c. Low gastric acidity
- d. Calories: full-term intake 110 to 130 calories/kg (50 to 60 calories/lb) of body weight is increased to 200 to 220 calories/kg (100 calories/lb) for adequate growth and to compensate for inadequate metabolism

## 10. Excretion: reduced glomerular filtration rate results in decreased ability to concentrate urine and conserve fluid

# ***Nursing Care of Preterm Infants***

## **Assessment/Analysis**

1. Respiratory rate and effort; heart rate; temperature; blood pressure
2. Oxygen concentrations via oximeter
3. Skin color and integrity
4. CNS integrity
5. Daily weight; fluid and electrolyte status (radiant warmer causes dehydration)
6. Sucking ability; nutritional status

7. Parents' ability to cope with preterm birth

## Planning/Implementation

1. Monitor vital signs; skin color; intake and output; laboratory reports of blood gases for acidosis
2. Maintain airway
  - a. Suction secretions when necessary
  - b. Position with head and chest elevated to promote ventilation
3. Maintain respirations
  - a. Observe for changes in respiratory status (e.g., increasing cyanosis; rapid, irregular respirations; flaring of nostrils; intercostal or suprasternal retractions; grunting on expiration)
  - b. Stimulate if apnea occurs
  - c. Administer oxygen as needed; monitor responses, regulate flow rate to prevent retinopathy of the newborn
  - d. Check ventilator function, if used
4. Maintain body temperature
  - a. Monitor for temperature lability
  - b. Adjust environmental temperature of radiant heater accordingly
5. Monitor for CNS changes (e.g., muscle twitching; seizures; cyanosis; abnormal respirations; short, shrill cry)
6. Maintain nutrition
  - a. Observe weight gain pattern
  - b. Monitor amount of intake
  - c. Adhere to techniques of gavage feeding
7. Maintain aseptic technique to prevent infection
8. Institute phototherapy for hyperbilirubinemia as ordered
9. Support parents
  - a. Encourage verbalization to relieve anxiety
  - b. Provide liberal visiting hours
  - c. Encourage participation in care; encourage talking to and touching infant
  - d. Refer to support group
10. Arrange for follow-up care before and after discharge

## Evaluation/Outcomes

1. Maintains respiratory functioning
2. Maintains body temperature within acceptable limits
3. Remains free from infection
4. Gains weight

## Respiratory Distress Syndrome (RDS)

### Data Base

A Deficiency in surface-active (detergent-like) lipoproteins (surfactant), resulting in inadequate lung inflation and ventilation

B Most common in preterm and low birth weight newborns, also in infants after cesarean birth

C Therapeutic intervention: surfactant replacement through endotracheal tube

## ***Nursing Care of Infants with Respiratory Distress Syndrome***

### **Assessment/Analysis**

1. Cyanosis
2. Tachypnea, dyspnea, sternal retractions, nasal flaring, grunting
3. Respiratory and metabolic acidosis

### **Planning/Implementation**

1. Admit to neonatal intensive care unit (NICU)
2. Maintain patent airway
3. Maintain oxygenation and high humidity; prevent chilling
4. Administer surfactant by aerosol as prescribed
5. Administer antibiotics as prescribed
6. Maintain mechanical ventilation, if used
7. Monitor for respiratory and metabolic acidosis
8. Administer feedings as ordered; attempt to prevent exhaustion

### **Evaluation/Outcomes**

1. Remains free from respiratory distress
2. Maintains fluid and electrolyte balance
3. Gains weight

## **Meconium Aspiration Syndrome (MAS)**

### ***Data Base***

A Compromised fetus releases meconium into amniotic fluid; fluid is aspirated during first few breaths after birth, causing pulmonary obstruction leading to chemical pneumonitis

B Therapeutic interventions

1. Amnioinfusion before birth to thin particles of meconium
2. Suctioning after head appears outside vaginal orifice
3. Surfactant lavages immediately after birth
4. Oxygenation and ventilation

## ***Nursing Care of Infants with Meconium Aspiration Syndrome***

## Assessment/Analysis

1. Signs of fetal hypoxia and meconium-stained amniotic fluid during intrapartum
2. Respiratory distress after birth
3. Signs of sepsis
4. Altered neurologic status (e.g., seizures)

## Planning/Implementation

1. Remove meconium and amniotic fluid from nasopharynx and oropharynx immediately after birth
2. See [Planning/Implementation under Respiratory Distress Syndrome](#)

## Evaluation/Outcomes

1. Maintains respiratory functioning
2. Remains free from infection
3. Feeds without difficulty

## Cranial Birth Injuries (Caput Succedaneum, Cephalohematoma, Intracranial Hemorrhage)

### Data Base

A Caput succedaneum: edema with extravasation of serum into scalp tissues caused by molding during birth process; crosses suture lines of bony skull plates; no treatment; subsides in several days ([Figure 27-5: Differences between caput succedaneum and cephalohematoma](#))

**FIGURE 27-5** Differences between caput succedaneum and cephalohematoma. **A**, Caput succedaneum. Edema of scalp noted at birth crosses suture lines. **B**, Cephalohematoma. Bleeding between periosteum and skull bone appearing within first 2 hours; does not cross suture lines. (From Lowdermilk DL, Perry SE: *Maternity and women's health care*, ed 9, St. Louis, 2007, Mosby.)

B Cephalohematoma: scalp edema with effusion of blood between skull bone and

periosteum; contained within suture line of bony skull plate; no treatment; disappears in several weeks to several months; resolution of hematoma can lead to hyperbilirubinemia

### C Intracranial hemorrhage

1. Bleeding into cerebellum, pons, and medulla oblongata caused by tearing of tentorium cerebelli
2. Risk factors: preterm infants, prolonged labor, difficult forceps birth, precipitate birth, version, breech extraction

## ***Nursing Care of Infants with Intracranial Hemorrhage***

### **Assessment/Analysis**

1. Abnormal respirations, cyanosis
2. Shrill or weak cry
3. Flaccidity or spasticity, seizures
4. Restlessness, wakefulness
5. Impaired sucking reflex

### **Planning/Implementation**

1. Maintain oxygenation in high-Fowler position
2. Maintain body temperature
3. Administer prescribed vitamins C and K to control and prevent further hemorrhage
4. Institute ordered gavage feedings if sucking reflex is impaired
5. Support parents because of guarded prognosis

### **Evaluation/Outcomes**

1. Remains free from neurologic damage
2. Gains weight

## **Neuromusculoskeletal Birth Injuries**

### ***Data Base***

A Facial paralysis: temporary paralysis of one side of face caused by pressure on cranial nerve VII (facial nerve) during difficult vaginal or forceps birth; no treatment; disappears in several days

B Erb-Duchenne paralysis (brachial palsy): paralysis of upper arm muscles caused by injury to brachial plexus during prolonged, difficult labor or traumatic birth; treatment depends on severity of paralysis

C Dislocations and fractures: caused by difficult birth/extraction birth; treatment depends on site of fracture

## ***Nursing Care of Infants with Neuromusculoskeletal Birth Injuries***

## Assessment/Analysis

1. Facial paralysis: inability to close eye; drawing mouth to one side; absence of forehead wrinkles when crying
2. Erb-Duchenne paralysis: flaccid arm with elbow extended; unequal Moro reflex
3. Fractures: variation in range of movement, immobility, crepitation

## Planning/Implementation

1. Facial paralysis: continue monitoring
2. Erb-Duchenne paralysis (brachial paralysis or palsy)
  - a. Massage and exercise arm as ordered to prevent contractures
  - b. Place in traffic cop or maître d' position
  - c. Apply ordered splints and braces (used when paralysis is severe)
3. Dislocations and fractures: position as ordered; provide care if swaddling, splints, slings, or casts are applied
4. Reassure parents; teach necessary care and positioning

## Evaluation/Outcomes

1. Maintains correct alignment of limb
2. Achieves movement in affected part

## Hemolytic Disorders

### Data Base

A Rh incompatibility: Rh-negative woman is sensitized to blood from her Rh-positive fetus or other sources (e.g., Rh-positive blood transfusion), causing production of antibodies to Rh-positive blood

1. These antibodies transfer through placenta to fetus in subsequent pregnancies; if fetus is Rh positive, agglutination and destruction of fetal red cells occur (pathologic jaundice, erythroblastosis fetalis); rarely a problem in first pregnancy unless previously sensitized
2. Prevention: RhoGAM (Rho (D) immune globulin) administered intramuscularly to Rh-negative mother at about 28 weeks' gestation and within 72 hours after birth or abortion; prevents production of antibodies in this pregnancy; mother must be negative for Rh antibodies to receive RhoGAM

### B ABO incompatibility

1. Most common when fetal blood type is A, B, or AB and mother is type O; mother's anti-A or anti-B antibodies transfer through placenta to fetus, causing hemolysis resulting in fetal anemia, jaundice, and kernicterus (excessively high bilirubin levels) within first 24 hours after birth (pathologic jaundice)
2. More common but less severe than Rh incompatibility; previous exposures to A, B, or AB blood do not increase formation of anti-A or anti-B antibodies, so first pregnancy can be affected

## C Therapeutic interventions

1. During pregnancy: amniotic fluid determinations using chemical and spectrophotometric analysis; elevated readings warrant either intrauterine exchange transfusion or induction of labor, depending number of weeks' gestation
2. Phototherapy: reduces mild to moderate kernicterus
3. Transfusions or exchange transfusions of Rh-negative blood for severely affected infants to decrease antibody level and increase RBC count and hemoglobin level

## ***Nursing Care of Infants with Hemolytic Disorders***

### **Assessment/Analysis**

1. Verification of blood incompatibility (e.g., ABO, Rh) between mother and fetus
2. Jaundice; increasing bilirubin levels during first 24 hours after birth
3. Laboratory results of bilirubin, hematocrit, and hemoglobin levels
4. Lethargy or irritability
5. Ineffective feeding pattern, vomiting
6. Enlargement of liver and spleen
7. Signs of kernicterus (e.g., absence of Moro reflex, apnea, high-pitched cry, opisthotonos, tremors, seizures)

### **Planning/Implementation**

1. Monitor maternal antibody titers
2. Administer RhoGAM to Rh-negative mother within 72 hours after birth if neonate is Rh positive and mother has not been sensitized
3. Teach parents
  - a. Why RhoGAM is necessary if not previously sensitized
  - b. Reason for intrauterine or extrauterine exchange transfusions
4. Provide care during phototherapy
  - a. Bank of phototherapy lights: place unclothed under lights at distance as per protocol; turn according to protocol; cover eyes completely with opaque mask; remove mask during feedings to check eyes and promote visual contact; monitor temperature; maintain adequate hydration
  - b. Fiberoptic blanket: place blanket around torso or place flat in bed; place thin pad between device and newborn; cover eyes with mask as per protocol; may be held

### **Evaluation/Outcomes**

1. Mother remains free from Rh isoimmunization
2. Neonate remains free from injury

## **Thrush**

### ***Data Base***

- A Oral infection caused by *Candida albicans*, a fungus
- B Transmitted as neonate passes through vaginal canal
- C Postnatal risk factors: unclean feeding utensils, inadequately cleansed breasts before breastfeeding, ineffective hand-washing techniques

## ***Nursing Care of Infants with Thrush***

### **Assessment/Analysis**

1. White patches on tongue, palate, inner cheeks that bleed when touched
2. Sucking difficulties

### **Planning/Implementation**

1. Teach mother how to cleanse breasts or feeding equipment before feeding
2. Teach how to apply oral antifungal topical agents (e.g., nystatin [Mycostatin])

### **Evaluation/Outcomes**

1. Infant achieves infection-free status
2. Infant gains weight

## **Ophthalmia Neonatorum**

### ***Data Base***

- A Eye infection caused by *Neisseria gonorrhoeae* or *Chlamydia trachomatis*
- B Transmitted from genital tract of infected mother during birth or by infected hands
- C Prevention: ophthalmic antibiotic (e.g., 0.5% erythromycin ophthalmic ointment) instilled at birth

## ***Nursing Care of Infants with Ophthalmia Neonatorum***

### **Assessment/Analysis**

1. Perinatal history of maternal infection
2. Purulent conjunctivitis without treatment manifested 3 to 4 days after birth
3. Respiratory status with chlamydial infection (may cause pneumonia)

### **Planning/Implementation**

1. Cleanse eyes with normal saline solution by wiping from inner to outer canthus
2. Administer prescribed antibiotic
3. Refer for ophthalmic evaluation
4. Monitor vital signs
5. Administer oxygen with chlamydial infection

## Evaluation/Outcomes

1. Maintains or achieves infection-free status
2. Remains free from sequelae of infection

## Syphilis

### Data Base

- A Congenital systemic infection caused by *Treponema pallidum*
- B Transmitted to fetus by mother
- C Incidence: varies with stage of mother's disease at time of pregnancy
- D Fetus infected after fourth month of pregnancy; earlier in pregnancy Langerhans cells in chorion provide protective barrier
- E Length of time infection is untreated correlates with amount of damage to fetus
- F Adequate treatment of pregnant woman with antibiotic treats fetus

### Nursing Care of Infants with Syphilis

## Assessment/Analysis

1. Perinatal history of maternal infection and treatment with antibiotic
2. Signs of congenital syphilis (e.g., maculopapular lesions of palms of hands and soles of feet)
3. Restlessness
4. Rhinitis, hoarse cry
5. Enlargement of spleen, palpable lymph nodes
6. Enlarged ends of long bones on x-ray examination

## Planning/Implementation

1. Administer prescribed antibiotics (usually penicillin); not contagious after 12 hours of treatment
2. Teach parents importance of continued health supervision

## Evaluation/Outcomes

1. Maintains or achieves infection-free status
2. Remains free from sequelae of infection

## Human Immunodeficiency Virus (HIV)/Acquired Immunodeficiency Syndrome (AIDS)

### Data Base

- A Generalized invasion of T cells by human immunodeficiency virus (HIV)
- B Maternal clinical findings

1. Recurrent vulvovaginal candidiasis
2. Bacterial vaginosis
3. Recurrent genital herpes simplex virus
4. Human papillomavirus
5. Pelvic inflammatory disease
6. Cervical dysplasia and neoplasms

C Transmitted by mother to fetus

D Clinical manifestations not present at birth

E Treatment with zidovudine (AZT) during pregnancy reduces risk of transmission

## ***Nursing Care of Infants Who are Human Immunodeficiency Virus (HIV) Positive or Have Acquired Immunodeficiency Syndrome***

### **Assessment/Analysis**

1. Signs of prematurity or SGA
2. Failure to thrive
3. Enlarged spleen and liver
4. Diarrhea, weight loss
5. Neurologic deficits
6. Subsequent frequent and debilitating infections

### **Planning/Implementation**

1. Obtain blood specimen for HIV screening; done if either parent is at high risk for HIV or has been diagnosed as HIV positive
2. Institute and teach parents standard precautions
3. Inform parents that virus may be transmitted via breast milk and that infant should be formula fed (in developing countries breastfeeding may be acceptable where there are no safe alternatives)
4. Emphasize importance of continued health supervision
5. Encourage and provide human contact to meet infant's emotional needs

### **Evaluation/Outcomes**

1. Infant remains free from opportunistic infections
2. Caregiver maintains standard precautions

## **Necrotizing Enterocolitis (NEC)**

### **Data Base**

A Necrotic lesions in intestines resulting from three factors: intestinal ischemia; presence of pathologic bacteria colonies; excess formula in intestines

B More common in preterm and formula-fed infants; occurs several weeks after birth

C Prevention: encouragement of breastfeeding

D Therapeutic interventions: surgical excision, which may lead to short bowel syndrome; early minimal feedings may be protective

## ***Nursing Care of Infants with Necrotizing Enterocolitis***

### **Assessment/Analysis**

1. Abdominal distention, diminished or absent bowel sounds
2. Impaired sucking, vomiting, loss of weight
3. Gastrointestinal bleeding

### **Planning/Implementation**

1. Maintain NPO and nasogastric decompression
2. Administer IV therapy and total parenteral nutrition as prescribed
3. Monitor fluid and electrolyte balance
4. Provide ileostomy or colostomy care if ostomy is created
5. Provide nonnutritive sucking (e.g., pacifier)

### **Evaluation/Outcomes**

1. Maintains fluid and electrolyte balance
2. Gains weight

## **Sepsis**

### ***Data Base***

A Generalized bacterial infection

B Risk factors: infected amniotic fluid; infected birth canal; break in aseptic technique after birth

## ***Nursing Care of Infants with Sepsis***

### **Assessment/Analysis**

1. Poor feeding, vomiting
2. High temperature, inability to maintain temperature
3. Lethargy, increasing irritability
4. Signs of anemia (e.g., pallor, weakness)
5. Frequent stools

### **Planning/Implementation**

1. Monitor IV fluid administration
2. Administer oxygen as ordered
3. Administer prescribed IV antibiotic therapy

4. Aid in decontaminating areas on the unit that house newborns

## **Evaluation/Outcomes**

1. Maintains fluid and electrolyte status
2. Achieves infection-free status

## **Substance Dependence (Neonatal Abstinence Syndrome)**

### **Data Base**

A Physiologic dependence on addictive substance (e.g., alcohol, methadone, heroin, cocaine) resulting from maternal drug use and/or abuse

B Incidence: perinatal mortality 6 to 8 times higher than in control group

C Maternal alcohol abuse can result in fetal alcohol syndrome producing congenital defects (e.g., short, thin upper lip; hypoplastic maxilla; microcephaly; motor and mental retardation; persistent growth lag)

D Clinical findings

1. Respiratory distress, jaundice, congenital anomalies, behavioral aberrations
2. Withdrawal signs appear soon after birth; severity depends on length of maternal addiction, type of drug used, amount of drug taken, concurrent use of other drugs, and when drug was taken before birth; may persist for up to 4 months

Nursing Care of Infants Who Are Dependent on Alcohol or Opioids

### **Assessment/Analysis**

1. Maternal intake of drug: type, time, amount
2. Signs of withdrawal
  - a. Facial scratches, hyperactivity, tremors, seizures
  - b. Yawning, disturbed sleep
  - c. Tachypnea, sneezing, stuffy nose
  - d. Shrill cry
  - e. Ineffective sucking, drooling, vomiting
  - f. Diarrhea, excoriated buttocks

### **Planning/Implementation**

1. Monitor neuromuscular status
2. Monitor vital signs, support respiratory functioning
3. Provide small, frequent feedings
4. Administer prescribed sedatives or opioids
5. Minimize environmental stimuli, maintain seizure precautions
6. Promote parent-infant attachment when possible, provide constant caregiver
7. Hold and cuddle frequently, provide periods of uninterrupted rest
8. Swaddle when in crib
9. Use soft nipple to reduce sucking effort, administer supplemental methods of

nutritional support as prescribed

10. Encourage continued health supervision

11. Refer to appropriate community-service agencies for family support and supervision

## **Evaluation/Outcomes**

1. Maintains respiratory functioning
2. Survives withdrawal from drug
3. Establishes a sleeping pattern
4. Gains weight

## **Torch**

### **Data Base**

A Acronym for

1. T—Toxoplasmosis (*Toxoplasma gondii*)
  - a. Acquired by eating raw or undercooked meat, contact with cat feces
  - b. Crosses placenta, severity related to gestational age at time of exposure
  - c. Newborn sequelae: hydrocephalus, intracranial calcifications, chorioretinitis
2. O—Others: HIV, gonorrhea, syphilis, human papillomavirus, varicella, group B streptococcus, hepatitis B virus, measles, mumps
3. R—Rubella (rubella virus)
  - a. Greatest risk if maternal infection occurs in first 12 weeks of gestation
  - b. May have active viral infection requiring isolation until pharyngeal mucus and urine are free of virus
  - c. Newborn sequelae: encephalitis, ocular abnormalities, cardiac maldevelopment, other defects
  - d. Vaccine should be administered in immediate postbirth period to mothers who have not had rubella or who are serologically negative; it should not be administered during pregnancy
4. C—Cytomegalic inclusion disease (cytomegalovirus)
  - a. Sexually transmitted infection; pregnant women usually asymptomatic
  - b. Newborn sequelae: hemolytic anemia, hydrocephalus, microcephalus, IUGR, neonatal death
5. H—Herpes genitalis (herpesvirus)
  - a. Contracted during sexual activity
  - b. Characterized by exacerbations and remissions; first attack most severe
  - c. Intercourse should be avoided during last 4 to 6 weeks of pregnancy
  - d. Cesarean birth required during exacerbation because vaginal birth may cause neonatal infection resulting in death
  - e. Newborn sequelae: CNS involvement, visual impairment

B Therapeutic interventions: prevention and early treatment of pregnant woman to eliminate or reduce risk to fetus

# Congenital Disorders

Structural or metabolic problems that may be genetically determined or a result of environmental interference during intrauterine life (see [Chapter 30](#), Nursing Care of Infants, and [Chapter 31](#), Nursing Care of Toddlers)

## CHAPTER 28

# Childbearing and Women's Health Nursing

---

## Review Questions with Answers and Rationales

### Questions

---

**Note:** Thousands of additional practice questions are available on the enclosed companion CD.

▶ Denotes alternate format question.

# Nursing Care to Promote Childbearing and Women's Health

1. A woman arrives at the prenatal clinic stating that her pregnancy test is positive. She asks the nurse for information about an abortion. After verifying that the woman is at 8 weeks' gestation, the nurse counsels her that having an abortion is controversial and that many women have long-term guilt feelings after an abortion. Legally, the:
  1. nurse's statements need not be based on current clinical research.
  2. client has a right to receive correct, unbiased information.
  3. nurse has a right to state feelings as long as they are identified as the nurse's own.
  4. health care provider should be notified because this is beyond the scope of nursing practice.
2. One day the family planning clinic is very busy, and the supervisor asks a nurse from the pediatric clinic who is strongly opposed to any chemical or mechanical method of birth control to work in the family planning clinic. What is the **most** professional response that this nurse could give to the supervisor?
  1. "I will go, but it is against my beliefs."
  2. "I won't do it because I do not believe in birth control."
  3. "I would prefer another assignment that is not contrary to my beliefs."
  4. "I will have to reinforce that the rhythm method is the method of choice."
3. The result of an amniocentesis performed at 16 weeks' gestation reveals a fetus with Down syndrome. The client elects to have the pregnancy terminated. What should the nurse conclude about an abortion at this stage of the pregnancy?
  1. The client is exhibiting emotional instability.
  2. There is a high risk for a postoperative infection.
  3. Contraceptive counseling should be deferred to a later time.
  4. An opportunity to express feelings about her decision should be provided.
4. Which research-based knowledge guides a nurse regarding the emotional factors of pregnancy?
  1. A rejected pregnancy will result in a rejected infant.
  2. Ambivalence and anxiety about mothering are common.
  3. A mother's love usually develops within the first week after birth.
  4. An effective mother does not experience ambivalence and anxiety about mothering.
5. Why is it important for a nurse to support the parents' decision to abort a fetus with a birth defect even if the nurse is morally against abortion?
  1. Supporting them will eliminate feelings of guilt.
  2. The parents are legally responsible for the decision.
  3. It is essential for maintenance of the family equilibrium.
  4. The nurse's support will relieve the pressure caused by this decision.
6. During the postpartum period a client with heart disease and type 2 diabetes asks a nurse, "Which contraceptives will I be able to use to prevent pregnancy in the near future?" How should the nurse respond?

1. "You may use oral contraceptives because they are almost completely effective in preventing a pregnancy."
2. "You should use foam with a condom to prevent pregnancy because this is the safest method for women with your illnesses."
3. "You will find that the intrauterine device is best for you because it prevents a fertilized ovum from implanting in the uterus."
4. "You do not need to worry about becoming pregnant in the near future because women with your illnesses usually become infertile."
7. A nurse is teaching a group of women about the side effects of different types of contraceptives. What is the **most** frequent side effect associated with the use of an intrauterine device (IUD)?
  1. A tubal pregnancy
  2. A rupture of the uterus
  3. An expulsion of the device
  4. An excessive menstrual flow
8. A client asks a nurse about the **most** common problem associated with the use of an intrauterine device (IUD). What should the nurse respond?
  1. Perforation of the uterus
  2. Spontaneous device expulsion
  3. Discomfort associated with coitus
  4. Development of vaginal infections
9. A client seeking advice about contraception asks a nurse about how an intrauterine device (IUD) prevents pregnancy. How should the nurse respond?
  1. "It covers the entrance to the cervical os."
  2. "The openings to the fallopian tubes are blocked."
  3. "The sperm are prevented from reaching the vagina."
  4. "It produces a spermicidal intrauterine environment."
10. A nurse teaches women in the fertility clinic that after ovulation has occurred, the ovum is thought to remain viable for:
  1. 1 to 6 hours.
  2. 12 to 18 hours.
  3. 24 to 36 hours.
  4. 48 to 72 hours.
11. A nurse is teaching clients to determine the time of ovulation by taking the basal temperature. What change is expected to occur in the basal temperature during ovulation?
  1. Slight drop and then rises
  2. Sudden rise and then drops
  3. Marked rise and remains high
  4. Marked drop and remains lower
12. Oral contraceptives are prescribed for a client. What side effect should the nurse inform the client might occur?
  1. Cervicitis

2. Ovarian cysts
  3. Breakthrough bleeding
  4. Fibrocystic breast disease
13. What is important for a nurse to discuss with a client who just had a vasectomy?
1. Recanalization of the vas deferens is impossible.
  2. Unprotected coitus is safe within 1 week to 10 days.
  3. Some impotency is to be expected for several weeks.
  4. There must be 15 ejaculations to clear the tract of sperm.
14. The school nurse is discussing issues concerning premarital sex with a group of adolescents taking a health education course. The students are asked to write an essay on what they have learned about preventing pregnancy. Which comment alerts the nurse to have a private discussion with the student?
1. "I can't get pregnant if I have sex during my period."
  2. "The pill may prevent me from getting pregnant, but I can still get an STI."
  3. "I won't get pregnant if I swim in a pool where a boy has just masturbated."
  4. "A condom will not always protect me from getting pregnant, but it can protect me from getting an STI."
15. Contraceptives that have estrogen-like and/or progesterone-like compounds are prepared in a variety of forms. Which contraceptives should a nurse identify as having a hormonal component? **Select all that apply.**
1. Oral agents
  2. Diaphragms
  3. Cervical caps
  4. Female condoms
  5. Foam spermicides
  6. Transdermal agents
16. A nurse explains that the efficiency of the basal body temperature method of contraception depends on fluctuation of the basal body temperature. What factor will alter its effectiveness?
1. Presence of stress
  2. Length of abstinence
  3. Age of those involved
  4. Frequency of intercourse
17. A biphasic antioviulatory medication of combined progestin and estrogen is prescribed for a female client. What should a nurse include when teaching about this oral contraceptive?
1. Report irregular vaginal bleeding.
  2. Restrict sexual activity temporarily.
  3. Have regular bimonthly Pap smears.
  4. Increase the dietary intake of calcium.
18. A nurse is giving discharge instructions to a client who had an aspiration abortion by suction curettage. What should the client be told?
1. Avoid showering for 2 days.

2. Tampons may be used after 1 day.
  3. Sexual intercourse should be delayed for 3 weeks.
  4. Report bleeding that requires a pad change every 2 hours.
19. A client at 10 weeks' gestation elects to have an induced abortion. After receiving oral mifepristone (Mifeprex), she returns to the clinic 2 days later to have misoprostol (Cytotec) inserted vaginally. For when should the nurse schedule a follow-up visit?
1. 4 hours after the procedure
  2. 2 weeks after the procedure
  3. 4 to 8 days after the procedure
  4. 8 to 24 hours after the procedure
20. A couple indicate that they do not want any more children. The woman is scheduled for a laparoscopic bilateral tubal ligation. What should the nurse include in preoperative teaching?
1. "Menstruation will stop after the surgery."
  2. "Birth control will be needed until your follow-up visit."
  3. "You will be admitted as an outpatient for same-day surgery."
  4. "You can have the operation reversed if you decide to have more children."
21. One of the responsibilities of a nurse in a fertility specialist's office is to provide health teaching to the client in relation to timing of intercourse. Which instruction addresses the **best** time to achieve a pregnancy?
1. Midway between periods
  2. Immediately after menses end
  3. 14 days before the next period is expected
  4. 14 days after the beginning of the last period
22. A nurse teaches a client that a postcoital test to evaluate fertility should be performed:
1. 1 week after ovulation.
  2. immediately after menses.
  3. just before the next menstrual period.
  4. within 1 to 2 days of presumed ovulation.
23. A hysterosalpingography (HSG) is performed to determine whether there is a tubal obstruction. The nurse concludes that infertility caused by a defect in the tube is **most** often related to a:
1. tubal injury.
  2. past infection.
  3. fibroid tumor.
  4. congenital anomaly.
24. A nurse is counseling a couple in the fertility clinic. Which aspect of the protocol is the **most** stressful for the couple?
1. Planning when to have intercourse
  2. Obtaining the necessary specimens
  3. Visiting the fertility clinic frequently
  4. Taking daily basal body temperatures

25. Genetic testing is being discussed with a couple at the fertility clinic. What is the nurse's **best** response when they express concerns?
1. "You should be tested because it will be to your benefit."
  2. "Environmental factors can have an impact on genetic factors."
  3. "This type of testing will determine if you'll need in vitro fertilization."
  4. "If you have a gene for a disease there is a probability that your children will inherit it."
26. A client is admitted with a diagnosis of torsion of the testes. How should the nurse respond when the client asks, "Why must I have surgery immediately?"?
1. "There is no other way to control the pain."
  2. "Irreversible damage occurs after a few hours."
  3. "Swelling is excessive, which may cause the testicle to rupture."
  4. "There is a reduction in testicular blood flow, which leads to rapid death of sperm."
27. A nurse at the fertility clinic is counseling a couple about the tests that will be needed to determine the cause of their infertility. Which test should the nurse describe that will evaluate the woman's organs of reproduction?
1. Biopsy
  2. Cystogram
  3. Culdoscopy
  4. Hysterosalpingogram
28. While preparing a client for her first routine Papanicolaou (Pap) smear, a nurse determines that she appears anxious. What should the nurse include as part of the teaching plan?
1. Current statistics on the incidence of cervical cancer
  2. Description of the early symptoms of cervical cancer
  3. Explanation of why there is a small risk for cervical cancer
  4. Written instructions about the purpose of the Papanicolaou smear
29. A client who menstruates regularly every 30 days asks a nurse on what day she is **most** likely to ovulate. Her last menses started on January 1st. On what day in January should the nurse respond?
1. 7th
  2. 16th
  3. 24th
  4. 29th

# Nursing Care Related to Major Disorders Affecting Women's Health

30. A client who has a diagnosis of endometriosis is concerned about the side effect of hot flashes from her prescribed medication. She tells the nurse that her mother found them very uncomfortable during her menopause. Which medication causes this side effect?

1. Estrogen (Premarin)
2. Leuprolide (Lupron)
3. Diclofenac (Voltaren)
4. Ergonovine (Ergotrate)

31. At 6 weeks' gestation a client is diagnosed with gonorrhea. What medication does a nurse expect the health care provider to prescribe?

1. Ceftriaxone (Rocephin)
2. Levofloxacin (Levaquin)
3. Sulfasalazine (Azulfidine)
4. Trimethoprim/sulfamethoxazole (Bactrim)

32. A 15-year-old adolescent tells a school nurse, "I have persistent pain during my periods." What should the nurse encourage her to do?

1. Continue daily activities.
2. Have a gynecologic examination.
3. Eat a nutritious diet containing iron.
4. Practice relaxation of abdominal muscles.

33. A client at the women's health clinic tells the nurse she has endometriosis. What factors associated with endometriosis does the nurse anticipate the client will report?

**Select all that apply.**

1. Insomnia
2. Ecchymoses
3. Rectal pressure
4. Abdominal pain
5. Skipped periods
6. Pelvic infections

34. What does a nurse expect to be the **priority** concern of a 28-year-old woman who is to undergo a laparoscopic bilateral salpingo-oophorectomy?

1. Acute pain
2. Risk for hemorrhage
3. Fear of chronic illness
4. Loss of childbearing potential

35. A nurse is assessing a client who is being admitted for surgical repair of a rectocele. What signs or symptoms does the nurse expect the client to report? **Select all that apply.**

1. Painful intercourse
2. Crampy abdominal pain

3. Bearing-down sensations
4. Urinary stress incontinence
5. Recurrent urinary tract infections
36. When taking the health history of a client who is admitted for repair of a cystocele and rectocele, the nurse should expect the client to report the occurrence of:
  1. white vaginal discharge and itching.
  2. sporadic bleeding and abdominal pain.
  3. elevated temperature and intractable diarrhea.
  4. stress incontinence and low abdominal pressure.
- 37.▶ A client has an anterior and posterior surgical repair of a cystocele and rectocele and returns from the postanesthesia care unit (PACU) with an indwelling catheter in place. What should the nurse tell the client about the **primary** reasons for the catheter? **Select all that apply.**
  1. Discomfort is minimized.
  2. Bladder tone is maintained.
  3. Urinary retention is prevented.
  4. Pressure on the suture line is relieved.
  5. Hourly urine outputs can be easily measured
38. A client past menopause undergoes an anterior-posterior colporrhaphy. What should the discharge teaching include?
  1. Eating a high-fiber diet
  2. Limiting daily activities
  3. Reporting signs of urinary retention
  4. Observing for signs of a rectovaginal fistula
39. What potential complication does a nurse anticipate when admitting a client with the diagnosis of severe procidentia (prolapse of the uterus)?
  1. Edema
  2. Fistulas
  3. Exudate
  4. Ulcerations
40. A client with a third-degree uterine prolapse is scheduled for a vaginoplasty. What should the nurse anticipate the surgeon will order?
  1. Encourage ambulation.
  2. Elevate the foot of the bed.
  3. Apply moist compresses to the uterus.
  4. Support the prolapsed uterus with a sanitary pad.
41. What resting position should a nurse encourage for a client with pelvic inflammatory disease (PID)?
  1. Sims
  2. Fowler
  3. Supine with knees flexed
  4. Lithotomy with head elevated
42. A nurse explains to a client with cervical erosion that early treatment of the erosion

can help prevent:

1. cancer of the cervix.
2. pelvic inflammatory disease.
3. unexpected vaginal bleeding.
4. more erosions from occurring.

43. A client asks a nurse why she developed cervical polyps. How should the nurse respond?

1. "They are often malignant and must be removed."
2. "Cervical polyps usually are precursors of uterine cancer."
3. "They are usually benign and a biopsy rules out a malignancy."
4. "Cervical polyps do not cause bleeding unless they are malignant."

44. A nurse in the women's health clinic is counseling clients about the signs of gynecological problems. What early manifestation of cervical cancer should prompt a client to seek professional care?

1. Abdominal heaviness
2. Pressure on the bladder
3. Foul-smelling discharge
4. Bloody spotting after intercourse

45. After a client has a biopsy for suspected cervical cancer, the laboratory report reveals a stage 0 lesion. What does a nurse conclude about this client's stage of cancer?

1. The lesion is carcinoma in situ.
2. There is early stromal invasion.
3. There is parametrial involvement.
4. The cancer is confined to the cervix.

46. A nurse in the women's health clinic is obtaining a client's health history. What question will elicit information about the client's risk for exposure to diethylstilbestrol (DES)?

1. "Were you born before 1971?"
2. "Have you ever taken oral contraceptives?"
3. "Have you noticed any lesions in your perineal area?"
4. "Did your mother take hormones during her pregnancy?"

47. A 35-year-old client is scheduled for a conization of the cervix to remove dysplastic cervical cells and to determine the extent of involvement. What behavior indicates to a nurse that the client understands the postoperative instructions?

1. States she will not resume sexual intercourse for 48 hours
2. Verbalizes expectations of a vaginal discharge for 3 to 5 days
3. Demonstrates the ability to change sterile surgical dressings
4. Affirms that because she has children she does not mind being sterile

48. A client with cancer of the cervix has an intracavity radioactive sealed implant in place. What precaution should the nurse take to protect against excessive exposure to radiation?

1. Dispose of body fluids in special marked containers.
2. Cohort two clients who have implanted radiation therapy.

3. Exit the room walking backward while wearing a lead apron.
4. Limit visitors to individuals who are 13 years of age and older.
49. A client who is scheduled to have an abdominal panhysterectomy asks how the surgery will affect her periods. How should the nurse respond?
  1. "You will not have any more periods."
  2. "Your periods will become more regular."
  3. "Your periods will become lighter until they disappear."
  4. "You will notice that the time between periods will be longer."
50. A client is diagnosed with uterine fibroids, and the health care provider advises a hysterectomy. The client expresses concern about having a hysterectomy at age 45 because she has heard from friends that she will undergo severe symptoms of menopause after surgery. What is the nurse's **most** appropriate response?
  1. "You are correct, but there are medicines you can take that will ease the symptoms."
  2. "This sometimes occurs in women of your age, but you needn't worry about it at this time."
  3. "Perhaps you should talk to your surgeon because I am not allowed to discuss this with you."
  4. "Some women may experience symptoms of menopause if their ovaries are removed with their uterus."
51. After a hysterosalpingo-oophorectomy, a client wants to know whether it would be wise for her to take hormones right away to prevent symptoms of menopause. What is the nurse's **most** appropriate response?
  1. "It is best to wait because you may not have any symptoms."
  2. "It is comforting to know that hormones are available if you should ever need them."
  3. "You have to wait until symptoms are severe; otherwise, hormones will have no effect."
  4. "Discuss this with your health care provider, because it is important to know your concerns."
52. After an abdominal hysterectomy the client returns to the unit with an indwelling catheter. The nurse identifies that the urine in the client's collection bag has become increasingly sanguineous. What complication does a nurse suspect?
  1. An incisional nick in the bladder
  2. A urinary infection from the catheter
  3. Disseminated intravascular coagulopathy
  4. Uterine relaxation with increased bleeding
53. A client who had a mastectomy asks about the term *ERP-positive*. The nurse explains that tumor cells are evaluated for estrogen receptor protein to determine the:
  1. need for supplemental estrogen.
  2. feasibility of breast reconstruction.
  3. degree of metastasis that has occurred.
  4. potential response to hormone therapy.
54. A nurse is caring for a client who just had a mastectomy. How should the nurse position the client's arm on the affected side?
  1. In adduction supported by sandbags

2. In abduction surrounded by sandbags
  3. On pillows with the hand higher than the arm
  4. With the arm lower than the level of the heart
55. When encouraging a client to cough and deep breathe after a bilateral mastectomy, the client says, "Leave me alone! Don't you know I'm in pain?" What is the nurse's **most** therapeutic response?
1. "I know it hurts to cough, but try to use the incentive spirometer."
  2. "We'll start this tomorrow; I will give you something for your pain."
  3. "I understand that you are in pain; rest now, and I'll come back later."
  4. "Your pain is to be expected, but you must attempt to expand your lungs."
56. A nurse is writing a teaching plan about osteoporosis. The nurse should include in language that **most** clients would understand that osteoporosis is **best** described as:
1. avascular necrosis.
  2. pathologic fractures.
  3. hyperplasia of osteoblasts.
  4. decrease in bone substance.
57. The plan of care for a client with osteoporosis includes active and passive exercises, calcium supplements, and daily vitamins. How does a nurse determine that the desired effect of therapy is attained?
1. Mobility increases.
  2. Fewer muscle spasms occur.
  3. There is a more regular heartbeat.
  4. There are fewer bruises than before therapy.
58. A nurse is assessing a client for the potential for developing osteoporosis. Which factor in the client's history increases the risk for this disorder?
1. Estrogen therapy
  2. Hypoparathyroidism
  3. Prolonged immobility
  4. Excessive calcium intake
59. Which food selected by a client with osteoporosis indicates that the nurse's dietary instruction was effective?
1. Red meat
  2. Soft drinks
  3. Turnip greens
  4. Enriched grains
60. A thin older adult client is diagnosed with osteoporosis. What should the nurse include in the discharge plan for this client?
1. Encouragement of gradual weight gain
  2. Monitoring for decreased urine calcium
  3. Instructions relative to diet and exercise
  4. Safety factors when using opioids and nonsteroidal antiinflammatory drugs
61. A nurse is counseling a postmenopausal obese client how to prevent bone loss. Which statements indicate understanding of the strategies to prevent bone loss? **Select**

**all that apply.**

1. "I must go on a strict diet."
  2. "I will take 400 mg of vitamin D daily."
  3. "I should take 1200 mg of calcium daily."
  4. "Swimming or bike riding 5 times a week is good for me."
  5. "Joining an aerobics class 3 times a week will help my bones."
62. A health care provider prescribes teriparatide (Forteo), a parathyroid hormone (PTH) agonist, for a client with osteoporosis. What should the nurse consider before administering this medication?
1. It requires an increased intake of vitamin A.
  2. It prevents existing bone from being destroyed.
  3. Sunscreen should be used to prevent vitamin D absorption.
  4. Osteoblastic activity is stimulated more than osteoclastic activity.
63. A female client who has been sexually active for 5 years is diagnosed with gonorrhea. The client is upset and asks the nurse, "What can I do to prevent getting another infection in the future?" The nurse provides health teaching. Which client statement indicates that the teaching was effective?
1. "I will douche after each time I have sex."
  2. "Having sex is a thing of the past for me."
  3. "My partner must use a condom all the time."
  4. "I will use a spermicidal cream from now on."
64. A nurse is caring for a client who contracted a trichomonal infection. Which oral drug should the nurse anticipate the health care provider **most** likely will prescribe?
1. Penicillin G
  2. Gentian violet
  3. Nystatin (Mycostatin)
  4. Metronidazole (Flagyl)
65. A nurse is teaching a client how to self-administer a medicated douche. In which direction should the nurse instruct the client to direct the douche nozzle?
1. To the left
  2. To the right
  3. Toward the sacrum
  4. Toward the umbilicus

# Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period

66. At her first visit to the prenatal clinic, a client tells the nurse she is ambivalent about continuing the pregnancy. Why does the nurse conclude that the client is experiencing a crisis?

1. Mood changes occur during pregnancy.
2. Pregnancy is a period of change and adjustment to change.
3. Hormonal and physiologic changes occur during pregnancy.
4. Pregnancy changes the future parents' relationship with each other.

67. A pregnant woman who is at term is admitted to the birthing unit in active labor. She is excited about the anticipated birth because she has three sons and the amniocentesis indicated that she will have a girl. Which factor in the client's history alerts the nurse that the newborn will be at risk for a complication?

1. Her membranes ruptured two hours ago.
2. Her first child was diagnosed with hemophilia.
3. She used NSAIDs for frequent sinus headaches.
4. She had a placenta previa in a previous pregnancy.

68. A couple who recently emigrated from Israel tells a nurse in the prenatal clinic that they are concerned about a genetic disease that is prevalent among Jewish people. Which genetic blood test should the nurse recommend to determine the possibility of their child inheriting the disease?

1. Cystic fibrosis
2. Phenylketonuria
3. Turner syndrome
4. Tay-Sachs disease

69. A nurse is teaching a childbirth class to a group of pregnant women. One of the women asks the nurse at what point during the pregnancy does the embryo become a fetus. How should the nurse respond?

1. During the eighth week of the pregnancy
2. At the end of the second week of pregnancy
3. When the fertilized ovum becomes implanted
4. When the products of conception are visualized on the sonogram

70. A client at 35 weeks' gestation asks a nurse why her breathing has become more difficult. How should the nurse respond?

1. "Your lower rib cage is more restricted."
2. "Your diaphragm has been displaced upward."
3. "There is an increase in the size of your lungs."
4. "There is an increase in the height of your rib cage."

71. A nurse at the prenatal clinic examines a client and determines that her uterus has risen out of the pelvis and is now an abdominal organ. At what week of gestation does

this occur?

1. 8th week of pregnancy
2. 10th week of pregnancy
3. 12th week of pregnancy
4. 18th week of pregnancy

72. A client has several tests during pregnancy. Place the tests in the order they should be performed during pregnancy.

1. \_\_\_\_\_ Fetal movement test
2. \_\_\_\_\_ Sick cell screening
3. \_\_\_\_\_ Group B streptococcus culture
4. \_\_\_\_\_ Serum glucose for gestational diabetes
5. \_\_\_\_\_ Alpha-fetoprotein (AFP) testing for neural tube defects

73. What information should a nurse include when counseling a pregnant client about human immunodeficiency virus (HIV) testing? **Select all that apply.**

1. Risks of passing the virus to the fetus
2. Meaning of positive or negative test results
3. Disclosure of risk factors for contracting HIV
4. Requirement that pregnant women are tested for HIV
5. Emotional, legal, and medical implications of test results

74. At what time during prenatal development should the nurse expect the greatest fetal weight gain?

1. Third trimester
2. Second trimester
3. First eight weeks
4. Implantation period

75. A client tells the nurse that the first day of her last menstrual period was July 22, 2010. What is the estimated date of birth?

1. May 7, 2011
2. April 29 2011
3. April 22, 2011
4. March 6, 2011

76. What information concerning the childbearing process should the nurse teach a client during the first trimester of pregnancy?

1. Labor and birth
2. Signs and symptoms of complications
3. Role transition into parenthood and its acceptance
4. Physical and emotional changes resulting from pregnancy

77. A nurse is caring for a client during an ultrasonogram. What parameters does the nurse expect to be used when determining pregnancy dates?

1. Occipital frontal diameter at term
2. Crown to rump measurement until 11 weeks
3. Biparietal diameter of 12 cm or more at term
4. Diagonal conjugate is between 26 and 37 weeks

78. What change does a nurse expect in a client's hematologic system during the second trimester of pregnancy?

1. An increase in hematocrit
2. An increase in blood volume
3. A decrease in sedimentation rate
4. A decrease in white blood cells

79. During a physical in the prenatal clinic the client's vaginal mucosa is observed to have a purplish discoloration. What sign should the nurse document in the client's clinical record?

1. Hegar
2. Goodell
3. Chadwick
4. Braxton Hicks

80. What does a nurse explain to a pregnant client about the cause of her physiologic anemia?

1. Erythropoiesis decreases.
2. Plasma volume increases.
3. Utilization of iron decreases.
4. Detoxification by the liver increases.

81. The nurse reviews the blood test results of a client who is at 24 weeks' gestation. Which finding should be reported to the health care provider?

1. Platelets: 230,000 mm<sup>3</sup>
2. Hemoglobin: 10.8 g/dL
3. Fasting blood glucose: 90 mg/dL
4. White blood cell count: 10,000 mm<sup>3</sup>

82. At her first prenatal visit, a client says to the nurse, "I guess I'll be having an internal examination today." What is the nurse's **best** response?

1. "Yes, an internal exam is done at the mother's first visit."
2. "Are you fearful of having an internal examination done?"
3. "Have you ever had an internal examination done before?"
4. "Yes, a slightly uncomfortable internal exam must be done."

83. A pregnant client is making her first antepartum visit. She has a 2-year-old son born at 40 weeks, a 5-year-old daughter born at 38 weeks, and 7-year-old twin daughters born at 35 weeks. She had a spontaneous abortion 3 years ago at 10 weeks. Using the GTPAL format, what does the nurse document about the client's obstetric history?

1. G4 T3 P2 A1 L4
2. G5 T2 P2 A1 L4
3. G5 T2 P1 A1 L4
4. G4 T3 P1 A1 L4

84. A nurse is assessing a pregnant client during the third trimester. What clinical finding is an expected response to the pregnancy?

1. Tachycardia
2. Dyspnea at rest

3. Progressive dependent edema
4. Shortness of breath on exertion
85. A pregnant woman reports nausea and vomiting during the first trimester of pregnancy. An increase in which hormone should the nurse explain is the precipitating cause of the nausea and vomiting?
  1. Estrogen
  2. Progesterone
  3. Luteinizing hormone
  4. Chorionic gonadotropin
86. During a client's first visit to the prenatal clinic, a nurse discusses a pregnancy diet. The client states that her mother told her she should restrict her salt intake. What is the nurse's **best** response?
  1. "Your mother is correct. You should use less salt to prevent swelling."
  2. "Because you need salt to maintain body water balance, it is not restricted. Just eat a well-balanced diet."
  3. "Salt is an essential nutrient that is naturally reduced by the body's estrogen. There is no reason to restrict salt in your diet."
  4. "We no longer recommend that salt intake be as restricted as much as in the past. However, you shouldn't add salt to your food."
87. A pregnant client uses a computer continuously during her working hours. This has implications for her plan of care during pregnancy. What should a nurse recommend?
  1. "Try to walk around every few hours during the workday."
  2. "Ask for time in the morning and afternoon to elevate your legs."
  3. "Tell your boss that you cannot work beyond the second trimester."
  4. "Ask for time in the morning and afternoon to get something to eat."
88. A client at her first prenatal clinic visit is at 6 weeks' gestation. She asks how long she may continue to work and when she should plan to quit. How should the nurse respond?
  1. "What activities does your job entail?"
  2. "How do you feel about continuing to work?"
  3. "Most women work throughout their pregnancy."
  4. "Usually women quit work at the start of their third trimester."
89. Why is it important for a nurse in the prenatal clinic to provide nutritional counseling to all newly pregnant women?
  1. Most weight gain is caused by fluid retention.
  2. Different cultural groups favor different essential nutrients.
  3. Dietary allowances should not increase throughout pregnancy.
  4. Pregnant women must adhere to a specific pregnancy dietary regimen.
90. A primigravida in her 10th week of gestation is concerned because she has read that nutrition during pregnancy is important for the growth and development of the fetus. She wants to know something about the foods she should eat. What should be the nurse's **initial** response?
  1. Instruct her to continue eating her regular diet.
  2. Ask her what she has eaten over the last three days.

3. Give her a list of foods to help her plan her meals more efficiently.
  4. Emphasize to her the importance of limiting highly seasoned foods.
- 91. A pregnant woman tells a nurse in the prenatal clinic that she knows that folic acid is very important during pregnancy and she is taking a prescribed supplement. She asks the nurse what foods contain folic acid (folate) so she can add them to her diet in its natural form. Which foods should the nurse recommend? **Select all that apply.**
1. Beef and fish
  2. Milk and cheese
  3. Chicken and turkey
  4. Black and pinto beans
  5. Enriched bread and pasta
92. A client at 8 weeks' gestation reports having to urinate more often. The nurse explains that urinary frequency often occurs because bladder capacity during pregnancy is diminished by:
1. atony of the detrusor muscle.
  2. compression by the enlarging uterus.
  3. compromise of the autonomic reflexes.
  4. narrowing of the ureteral entrance at the trigone.
- 93. While caring for a pregnant client and her partner, a nurse suspects domestic violence. Which assessments support this suspicion? **Select all that apply.**
1. Woman has injuries to the breasts and abdomen.
  2. Partner refuses to come into the examination room.
  3. Partner answers questions that are asked of the woman.
  4. Woman has visited the clinic several times in the last month.
  5. Partner is excessively attentive while the health history is being taken.
- 94. A nurse who is caring for a mother and her newborn infant reviews their record. Using the data below, which nursing intervention is required?
1. Neonatal blood transfusion
  2. Maternal rubella vaccination
  3. Maternal RhoGAM injection
  4. Neonatal 50% glucose infusion

MATERNAL: Prenatal Laboratory Tests						
Type: RH:	Rubella Titer	RPR/VDRL	HB Sag	HIV	Hgb/Hct	Sickle Prep
A Neg	1:2	Neg	Neg	Neg	11/33	Neg

INFANT: Day 2 of Life Laboratory Tests			
Blood Glucose	Total Bilirubin	Blood type	Hct
46	10 mg	O Neg	55

95. A client at 10 weeks' gestation calls the clinic and tells a nurse that she has morning sickness and cannot control it. What should the nurse suggest to promote relief?

1. "Eat dry crackers before arising."
2. "Increase fat intake before bedtime."
3. "Drink high-carbohydrate fluids with meals."
4. "Have two small meals a day with a snack at noon."

96. What should a nurse suggest to a pregnant client that might help overcome first-trimester morning sickness?

1. "Eat protein before bedtime."
2. "Take an antacid before breakfast."
3. "Drink water until the nausea subsides."
4. "Request a prescription for an antiemetic."

97. What should a nurse include in nutritional planning for a newly pregnant woman of average height weighing 145 pounds?

1. A decrease of 100 calories per day
2. A decrease of 200 calories per day
3. An increase of 300 calories per day
4. An increase of 500 calories per day

98. A client is concerned about gaining weight during pregnancy. What should the nurse explain is the cause of the largest amount of weight gain during pregnancy?

1. Fetal growth
2. Fluid retention
3. Metabolic alterations
4. Increased blood volume

99. A client at 7 weeks' gestation tells a nurse in the prenatal clinic that she is sick every morning with nausea and vomiting and adds that she does not think she can tolerate it throughout her pregnancy. The nurse assures her that this is a common occurrence in early pregnancy and will probably disappear by the end of the:

1. fifth month.
2. third month.
3. fourth month.
4. second month.

100. A pregnant client is being prepared for a pelvic examination. She states that she is always tired and feels sick to her stomach, especially in the morning. What is the nurse's **best** response?

1. "Tell me about how you feel the rest of the day."
2. "Let's discuss ways to resolve these common problems."
3. "Perhaps you should ask your health care provider about it."
4. "There is no need to worry about these expected problems."

101. During a prenatal examination, a nurse draws blood from an Rh-negative client. The nurse explains that an indirect Coombs test will be performed to predict whether the fetus is at risk for developing:

1. acute hemolytic anemia.

2. respiratory distress syndrome.
  3. protein metabolism deficiency.
  4. physiologic hyperbilirubinemia.
102. What is the **best** advice a nurse can give to a pregnant woman in her first trimester?
1. "Cut down on drugs, alcohol, and cigarettes."
  2. "Avoid drugs, and refrain from smoking and ingesting alcohol."
  3. "Avoid smoking, limit alcohol consumption, and do not take aspirin."
  4. "Take only prescription drugs, especially in the second and third trimesters."
103. During a routine visit to the prenatal clinic, a client listens to the fetal heartbeat for the first time. The client, commenting on how rapid it is, appears frightened and asks whether this is normal. The nurse should respond, "The heart rate is:
1. usually rapid and is in the expected range."
  2. usually rapid and twice the mother's pulse rate."
  3. rapid, but I'd be more concerned if it were slow."
  4. rapid, but it accommodates the fetus's nutritional needs."
104. When involved in prenatal teaching, a nurse should inform clients that there is an increase in vaginal secretions during pregnancy called leukorrhea. What causes this increase?
1. Metabolic rate
  2. Production of estrogen
  3. Secretion from the Bartholin glands
  4. Supply of sodium chloride to the vaginal cell
105. A client who is 28 weeks into her second pregnancy is experiencing increasing edema in the lower extremities. The nurse advises rest with the legs elevated and provides dietary instructions. What else should the nurse suggest?
1. A preferred diet will include favorite foods
  2. A nutritionist should be involved in planning a diet.
  3. The foods selected do not need to have a low salt content.
  4. The client should be referred to the health care provider at the prenatal clinic.
106. What recommendation should a nurse give to clients who have fluid retention during pregnancy?
1. Decrease fluid intake.
  2. Maintain a low-sodium diet.
  3. Elevate the lower extremities.
  4. Ask the health care provider for a diuretic.
107. A 36-year-old multigravida who is at 14 weeks' gestation is scheduled for an alpha-fetoprotein test. She asks the nurse, "What does the alpha-fetoprotein test indicate?" The nurse bases a response on the knowledge that this test can detect:
1. kidney defects.
  2. cardiac anomalies.
  3. neural tube defects.
  4. urinary tract anomalies.
108. A client is scheduled for a nonstress test in the 37th week of gestation. A nurse

explains the procedure. Which statement demonstrates that the client understands the teaching?

1. "An IV will be needed to inject the medication."
2. "My baby may get very restless after this procedure."
3. "I hope this test does not cause my labor to begin early."
4. "If the heart reacts well, my baby should do okay when I give birth."

109. A client in the 18th week of pregnancy is scheduled for ultrasonography. What instruction should the nurse give the client?

1. "Don't eat for 4 hours after the test."
2. "Give yourself an enema the night before."
3. "Don't urinate for at least 3 hours before the test."
4. "You will be monitored closely afterward for signs of labor."

110. A nurse is teaching a primigravida about how she can identify the onset of labor. What clinical indicator of labor would necessitate the client to call her health care provider?

1. Bloody show and back pressure occur.
2. Contractions become regular or get stronger.
3. Membranes rupture or contractions are 5 to 8 minutes apart.
4. Contractions are 10 to 12 minutes apart and last about 30 seconds.

111. A nurse teaches a pregnant woman to avoid lying on her back during labor. What information about the result of lying in the supine position is the basis for the nurse's teaching?

1. Labor may take longer.
2. Placental perfusion is decreased.
3. Movement of the coccyx is obstructed.
4. Transient episodes of hypertension may occur.

112. A 42-year-old client has an amniocentesis during the 16th week of gestation because of concern about Down syndrome. What additional information about the fetus will examination of the amniotic fluid reveal at this time?

1. Lung maturity
2. Type 1 diabetes
3. Cardiac anomaly
4. Neural tube defect

113. During the postpartum period, a client tells a nurse she is having leg cramps. Which foods should the nurse encourage the client to eat?

1. Liver and raisins
2. Cheese and broccoli
3. Eggs and lean meats
4. Whole wheat breads and cereals

114. When is it **most** important for a female client to know that a fetus may be structurally damaged by the ingestion of drugs?

1. During early adolescence
2. Throughout the entire pregnancy

3. When planning to become pregnant
4. At the beginning of the first trimester

115. A pregnant client asks the clinic nurse how smoking will affect her baby. What information about cigarette smoking will influence the nurse's response?

1. It relieves tension and the fetus responds accordingly.
2. The resulting vasoconstriction affects both fetal and maternal blood vessels.
3. Substances contained in smoke diffuse through the placenta and compromise the fetus's well-being.
4. Effects are limited because fetal circulation and maternal circulation are separated by the placental barrier.

116. A client who is at 12 weeks' gestation tells a nurse at the prenatal clinic that she has severe nausea and frequent vomiting. The nurse suspects that the client has hyperemesis gravidarum. With what disorder is this frequently associated?

1. History of cholecystitis
2. Large amount of amniotic fluid
3. High levels of chorionic gonadotropin
4. Decreased secretion of hydrochloric acid

▶117. A nurse is planning a prenatal class about the changes that occur during pregnancy and the necessity of routine health care supervision throughout pregnancy. Which cardiovascular compensatory mechanisms should the nurse explain will occur? **Select all that apply.**

1. Systemic vasodilation
2. Increased blood volume
3. Elevated blood pressure
4. Increased cardiac output
5. Enlargement of the heart
6. Decreased erythrocyte production

118. The husband of a client who is in the transition phase of the first stage of labor becomes very tense and anxious during this period and asks a nurse, "Do you think it is best for me to leave, since I don't seem to be doing my wife much good?" What is the nurse's **best** response?

1. "This is the time your wife needs you. Don't run out on her now."
2. "This is hard for you. Let me try to help you coach her during this difficult phase."
3. "I know this is hard for you. You should go have a cup of coffee to help you relax and then come back in a little while."
4. "If you feel that way, you'd best go out and sit in the father's waiting room for a while. You may transmit your anxiety to your wife."

119. A nurse is caring for an obese client in early labor. The anesthesiologist discussed several types of analgesia/anesthesia with the client and recommended one. The client requests clarification before signing the consent form. Which type did the anesthesiologist recommend?

1. Epidural anesthesia
2. Oral opioid analgesia

3. Pudendal nerve anesthesia

4. IV infusion of opioid analgesia

120. During labor a client who has been receiving epidural anesthesia has a sudden episode of severe nausea, and her skin becomes pale and clammy. What is the nurse's immediate reaction?

1. Turn the client on her side.

2. Notify the health care provider.

3. Check the vaginal area for bleeding.

4. Monitor the fetal heart rate every three minutes.

121. A nurse is caring for a primigravida during labor. At 7 cm dilation a prescribed pain medication is administered. Which medication requires monitoring of the newborn for the side effect of respiratory depression?

1. Butorphanol (Stadol)

2. Hydroxyzine (Vistaril)

3. Promethazine (Phenergan)

4. Diphenhydramine (Benadryl)

122. A client in active labor becomes very uncomfortable and asks a nurse for pain medication. Nalbuphine (Nubain) is prescribed. How does this medication relieve pain?

1. Produces amnesia

2. Acts as a preliminary anesthetic

3. Induces sleep until the time of birth

4. Acts on opioid receptors to reduce pain

123. At a prenatal visit a client who is at 36 weeks' gestation states that she is having uncomfortable irregular contractions. What should the nurse recommend?

1. "Lie down until they stop."

2. "Walk around until they subside."

3. "Time the contractions for 30 minutes."

4. "Take 2 extra-strength aspirins if the discomfort persists."

124. How does the nurse identify true labor as opposed to false labor?

1. Cervical dilation is progressive.

2. Contractions stop when the client walks around.

3. Clients' contractions progress only in a side-lying position.

4. Contractions occur immediately after the membranes rupture.

125. Why should a nurse teach pregnant women the importance of conserving the "spurt of energy" before labor?

1. Energy helps to increase the progesterone level.

2. Fatigue may influence the need for pain medication.

3. Energy is needed to push during the first stage of labor.

4. Fatigue will increase the intensity of the uterine contractions.

126. A client is admitted to the birthing suite in early active labor. Which nursing action takes **priority** during the admission process?

1. Auscultating the fetal heart

2. Obtaining an obstetric history

3. Determining when the last meal was eaten
  4. Ascertaining whether the membranes have ruptured
127. A primigravida is admitted to the birthing unit in early labor. A pelvic examination reveals that her cervix is 100% effaced and 3 cm dilated. The fetal head is at +1 station. In what area of the client's pelvis is the fetal occiput?
1. Not yet engaged
  2. Below the ischial spines
  3. Entering the pelvic inlet
  4. Visible at the vaginal opening
128. After performing Leopold maneuvers on a laboring client, a nurse determines that the fetus is in the right occiput posterior (ROP) position. Where should the Doppler be placed to **best** auscultate fetal heart tones?
1. Above the umbilicus in the midline
  2. Above the umbilicus on the left side
  3. Below the umbilicus on the right side
  4. Below the umbilicus near the left groin
129. A client in the active phase of the first stage of labor begins to tremble, becomes very tense during contractions, and is quite irritable. She frequently states, "I cannot stand this a minute longer." What does this behavior indicate to the nurse caring for her?
1. There was no preparation for labor.
  2. She should receive an analgesic for pain.
  3. She is entering the transition phase of labor.
  4. Hypertonic uterine contractions are developing.
130. A nurse assesses the frequency of a client's contractions by timing them from the beginning of a contraction:
1. until the uterus starts to relax.
  2. to the end of a second contraction.
  3. until the uterus completely relaxes.
  4. to the beginning of the next contraction.
131. A nurse observes a laboring client's amniotic fluid and decides that it is the expected color. What description of amniotic fluid supports this conclusion?
1. Clear, dark amber, and contains shreds of mucus
  2. Straw-colored, clear, and contains little white specks
  3. Milky, greenish yellow, and contains shreds of mucus
  4. Greenish yellow, cloudy, and contains little white specks
- ▶132. A client in active labor has an external fetal monitor in place. Using the monitor strip on the next page, identify the correct assessment.
1. Tetanic contractions
  2. Marked FHR variability
  3. FHR baseline at 150 beats/min
  4. Contractions lasting 130 seconds

133. What is a common problem that confronts the client in labor when an external fetal monitor has been applied to her abdomen?
1. Intrusion on movement
  2. Inability to take sedatives
  3. Interference with breathing techniques
  4. Increased frequency of vaginal examinations
134. A client's membranes rupture while her labor is being augmented with an oxytocin (Pitocin) infusion. A nurse observes variable decelerations in the fetal heart rate on the fetal monitor strip. What action should the nurse take next?
1. Change the client's position.
  2. Take the client's blood pressure.
  3. Stop the client's oxytocin infusion.
  4. Prepare the client for an immediate birth.
- ▶135. Epidural anesthesia was initiated 30 minutes ago for a client in labor. The nurse identifies that the fetus is experiencing late decelerations. List the following nursing actions in order of priority.
1. \_\_\_\_\_ Increase IV fluids.
  2. \_\_\_\_\_ Reposition client on her side.
  3. \_\_\_\_\_ Reassess fetal heart rate pattern.
  4. \_\_\_\_\_ If late decelerations persist notify the health care provider.
  5. \_\_\_\_\_ Document interventions with related maternal/fetal responses.
136. A client's membranes spontaneously rupture during active labor. The nurse inspects the perineum and determines that the umbilical cord is not visible. What is the next nursing action?
1. Auscultate the FHR.
  2. Time the contractions.
  3. Call the health care provider.
  4. Obtain the maternal vital signs.
137. The membranes of a client who is at 39 weeks' gestation have ruptured spontaneously. Examination in the emergency department revealed that her cervix is

4 cm dilated and 75% effaced, and the fetal heart rate is 136 beats/min. She and her partner are admitted to the birthing unit. What should the nurse do upon their arrival?

1. Place the client in bed and attach an external fetal monitor.
2. Have the client undress while taking her history from her partner.
3. Introduce the staff nurses to the couple and try to make them feel welcome.
4. Ask the couple to wait in the examining room while notifying the health care provider.

138. A pregnant woman at 39 weeks' gestation arrives in the triage area of the birthing unit, stating she thinks her "water broke." What should the nurse do **first**?

1. Auscultate the fetal heart to determine fetal well-being.
2. Perform Leopold's maneuvers to rule out a breech presentation.
3. Check the vaginal introitus for the presence of the umbilical cord.
4. Do a nitrazine test on the vaginal fluid for verification of ruptured membranes.

139. A client is admitted to the birthing unit in active labor. What should the nurse expect after an amniotomy is performed?

1. Diminished bloody show
2. Increased and more variable FHR
3. Less discomfort with contractions
4. Progressive dilation and effacement

140. A primigravida who is at 40 weeks' gestation arrives at the birthing center with abdominal cramping and a bloody show. Her membranes ruptured 30 minutes before arrival. A vaginal examination reveals 1 cm dilation and the presenting part at -1 station. After obtaining the fetal heart rate and maternal vital signs, what should the nurse do next?

1. Teach the client how to push with each contraction.
2. Encourage the client to perform pattern-paced breathing.
3. Provide the client with comfort measures used for women in labor.
4. Prepare to have the client's blood typed and crossmatched for a possible transfusion.

▶141. A client is receiving an IV piggyback infusion of oxytocin (Pitocin) to augment labor. The nurse identifies that there have been three contractions lasting 80 to 90 seconds that are less than 2 minutes apart. There is a specific protocol that is followed in response to this observation. List in order of priority the nursing actions that should be taken.

1. \_\_\_\_\_ Check the fetal heart rate.
2. \_\_\_\_\_ Stop the piggyback infusion.
3. \_\_\_\_\_ Notify the health care provider.
4. \_\_\_\_\_ Administer oxygen via face mask.
5. \_\_\_\_\_ Document maternal/fetal responses.
6. \_\_\_\_\_ Determine if the contractions have diminished.

142. When monitoring the FHR of a client in labor, the nurse identifies an elevation of 15 beats more than the baseline rate of 135 beats/min lasting for 15 seconds. How should the nurse document this event?

1. An acceleration
2. An early elevation

3. A sonographic motion
4. A tachycardic heart rate

143. A client and her partner are working together during the woman's labor. The client's cervix is now dilated 7 cm, and the presenting part is low in the midpelvis. What should the nurse instruct the partner to do that would alleviate the client's discomfort during contractions?

1. Deep breathe slowly.
2. Perform pelvic rocking.
3. Use the panting technique.
4. Begin pattern-paced breathing.

144. Why should a nurse withhold food and oral fluids as a laboring client approaches the second stage of labor?

1. The mechanical and chemical digestive processes require energy that is needed for labor.
2. Undigested food and fluid may cause nausea and vomiting and limit the choice of anesthesia.
3. The gastric phase of digestion stimulates the release of hydrochloric acid and may cause dyspepsia.
4. Food and fluid will further aggravate gastric peristalsis, which is already increased because of the stress of labor.

145. How should a nurse direct care for a client in the transition phase of the first stage of labor?

1. Decrease IV fluid intake.
2. Help the client to maintain control.
3. Reduce the client's discomfort with medications.
4. Institute simple breathing patterns during contractions.

146. Which breathing technique should the nurse instruct the client to use as the head of the fetus is crowning?

1. Shallow
2. Blowing
3. Slow chest
4. Modified paced

147. When a client's legs are placed in stirrups for birth, the nurse confirms that both legs are positioned simultaneously to prevent:

1. venous stasis in the legs.
2. pressure on the perineum.
3. excessive pull on the fascia.
4. trauma to the uterine ligaments.

148. A nurse is caring for a primigravida during labor. What does the nurse observe that indicates birth is about to take place?

1. Bloody discharge from the vagina increases.
2. Perineum begins to bulge with each contraction.
3. Client becomes irritable and stops following instructions.

4. Contractions occur more frequently, are stronger, and last longer.

149. For what complication should a nurse monitor a client when an oxytocin (Pitocin) infusion is used to induce labor?

1. Intense pain
2. Uterine tetany
3. Hypoglycemia
4. Umbilical cord prolapse

150. The cervix of a client in labor is fully dilated and effaced. The head of the fetus is at +2 station. What should the nurse encourage the client to do during contractions?

1. Relax by closing her eyes.
2. Push with her glottis open.
3. Blow to slow the birth process.
4. Pant to prevent cervical edema.

151. A laboring client is to have a pudendal block. What should a nurse teach the client about the effects of the pudendal block?

1. Bladder sensation may be lost.
2. She will not feel an episiotomy.
3. She may lose the ability to push.
4. Contractions will no longer be felt.

►152. A nurse is caring for a client during the early postpartum period. The client alerts the nurse that she is having pain. The nurse interviews the client, obtains her vital signs, and performs a physical assessment. What does this assessment **most** likely indicate?

### **Vital Signs**

T: 99° F

P: 108 beats/min

R: 20 breaths/min

BP: 105/60 mm Hg

### **Physical Assessment**

Episiotomy surrounded by edema and ecchymosis

Fundus is firm

No lochia present

### **Client Interview**

Reports severe perineal and rectal pressure

1. Uterine infection
2. Urinary infection
3. Vaginal hematoma
4. Postpartum hemorrhage

153. After a client gives birth, what physiologic occurrence indicates to the nurse that the placenta is beginning to separate from the uterus and is ready to be expelled?

1. Relaxation of the uterus
2. Descent of the uterus in the abdomen
3. Appearance of a sudden gush of blood
4. Retraction of the umbilical cord into the vagina

154. A multigravida has a spontaneous vaginal birth. Five minutes later the placenta is expelled. Where does a nurse expect to locate the uterine fundus at this time?

1. In the pelvic cavity
2. Just below the xiphoid process
3. At the umbilicus and in the right quadrant
4. Halfway between the symphysis pubis and the umbilicus

155. A client in labor begins to experience contractions 2 to 3 minutes apart that last about 45 seconds. Between contractions the nurse identifies a fetal heart rate of 100 beats/min on the internal fetal monitor. What is the next nursing action?

1. Notify the health care provider.
2. Resume continuous fetal heart monitoring.
3. Continue to monitor the maternal vital signs.
4. Document the fetal heart rate as an expected response to contractions.

156. A client is bleeding excessively after the birth of a neonate. The health care provider orders fundal massage and prescribes an IV infusion containing 10 units of oxytocin (Pitocin) at 100 mL/hr. A nurse's evaluation of the client's responses to these interventions is BP: 135/90 mm Hg; uterus: boggy at 3 cm above the umbilicus and displaced to the right; perineal pad: saturated with bright red lochia. What is the nurse's next action?

1. Increase the infusion rate.
2. Assess for a distended bladder.
3. Continue to perform fundal massage.
4. Continue to assess the blood pressure.

157. A nurse is evaluating the effectiveness of fundal massage on a postpartum client 3 hours after giving birth. An IV infusion of 10 units of oxytocin (Pitocin) is infusing at 100 mL/hr. Her blood pressure is 135/90, the uterus is boggy at 3 cm above the umbilicus and displaced to the right, and her perineal pad is saturated with lochia rubra. What should the nurse do next?

1. Massage the fundus again.
2. Notify the health care provider.
3. Assist the client to the bathroom.
4. Increase the IV infusion rate as prescribed.

158. A primigravida who is at 35 weeks' gestation is diagnosed with hydramnios. For what should the nurse assess the newborn?

1. Cardiac defect
2. Kidney disorder
3. Diabetes mellitus

#### 4. Esophageal atresia

159. A client who just gave birth has three young children at home. She comments to the nursery nurse that she must prop the baby during feedings when she returns home because she has too much to do, and anyway holding babies during feedings spoils them. What is the nurse's **best** response?

1. "You seem concerned about time. Let's talk about it."
2. "That's up to you, since you have to do what works for you."
3. "Holding the baby when feeding is important for development."
4. "It is not safe to prop a bottle. The baby could aspirate the fluid."

160. A primipara has just given birth at 37 weeks' gestation. What should the nurse do to help promote the attachment process between the mother and her newborn?

1. Teach how to breastfeed the baby.
2. Encourage continuous rooming-in.
3. Assign one nurse to care for both of them.
4. Allow extra visiting privileges in the nursery.

161. A multigravida of Asian descent weighs 104 pounds, having gained 14 pounds during the pregnancy. On her second postpartum day, the client's temperature is 100.2° F. She is anorectic and rarely gets out of bed. What should the nurse do?

1. Ask the nursing supervisor to discuss this with the health care provider.
2. Encourage the family to bring in special foods preferred in their culture.
3. Order a high-protein milkshake as a between-meal snack to stimulate her appetite.
4. Explain to the family that the dietician plans nutritious meals that the client should eat.

162. At 9 PM visiting hours are officially over, but the sister of a newly admitted postpartum client remains at the bedside. What is the **most** appropriate nursing intervention?

1. Remind the client's sister that visiting hours are over.
2. Get written permission from the client for her sister to remain.
3. Call the evening nursing supervisor to tactfully handle the situation.
4. Encourage the sister to participate in care as much as the client wishes.

163. Three weeks after giving birth, a client develops a deep vein thrombophlebitis of the left leg and is admitted to the hospital for bed rest and anticoagulant therapy. Which anticoagulant does the nurse expect to administer?

1. Clopidogrel (Plavix)
2. Warfarin (Coumadin)
3. Continuous infusion of heparin
4. Intermittent doses of a low molecular weight heparin

164. A nurse teaches a postpartum client how to care for her episiotomy to prevent infection. Which behavior indicates that the teaching was effective?

1. The perineal pad is changed twice daily.
2. She washes her hands whenever a perineal pad is changed.
3. She rinses her perineum with water after using an analgesic spray.
4. The perineum is cleansed from the anus toward the symphysis pubis.

165. A nurse observes that a client is voiding frequently in small amounts 8 hours after giving birth. What should the nurse conclude about this small output of urine during the early postpartum period?

1. It may indicate retention of urine with overflow.
2. It may be indicative of beginning glomerulonephritis.
3. This is common because less fluid is excreted after birth.
4. This is common because fluid intake diminishes after birth.

166. When palpating a client's fundus on the second postpartum day, a nurse identifies that it is above the umbilicus and displaced to the right. What does the nurse conclude?

1. There is a slow rate of involution.
2. There are retained placental fragments.
3. The bladder has become overdistended.
4. The uterine ligaments are overstretched.

167. A nurse examines a client who had a cesarean birth. It is 3 days since the birth and the client is about to be discharged. Where does the nurse expect the fundus to be located?

1. 1 fingerbreadth below the umbilicus
2. 2 fingerbreadths below the umbilicus
3. 3 fingerbreadths below the umbilicus
4. 4 fingerbreadths below the umbilicus

168. A client on the postpartum unit asks the nurse why the nurses are always encouraging her to walk. What should the nurse consider when forming a response in language the client will understand?

1. Respirations are enhanced.
2. Bladder tonicity is increased.
3. Abdominal muscles are strengthened.
4. Peripheral vasomotor activity is promoted.

169. What should a nurse include in the discharge teaching of a postpartum client?

1. The prenatal perineal tightening exercises should be continued.
2. The episiotomy sutures will be removed at the first postpartum visit.
3. She may not have a bowel movement for up to a week after the birth.
4. She should schedule a postpartum checkup as soon as her menses return.

170. A nurse is caring for a postpartum client who is formula feeding. What should the nurse teach her about minimizing breast discomfort?

1. Apply covered ice packs to her breasts.
2. Gently apply cocoa butter to her nipples.
3. Place warm, wet washcloths on her nipples.
4. Manually express colostrum from her breasts.

171. Two days after having had a cesarean birth, a client tells a nurse that she has pain in her right leg, and after an assessment the nurse suspects that the client may have a thrombus. What is the nurse's **initial** response?

1. Maintain bed rest.
2. Apply warm soaks.

3. Encourage leg exercises.
4. Massage the affected area.

172. A nurse teaches a multipara who has just given birth to a large baby how she can maintain a contracted uterus. Which statement indicates to the nurse that the teaching was effective?

1. "If I start to bleed, I will call for help."
2. "I will massage my uterus regularly to keep it firm."
3. "If I urinate frequently, my uterus will stay contracted."
4. "I will call you every 15 minutes to massage my uterus."

►173. Two days after giving birth a client's temperature is 101° F. A nurse notifies the health care provider and receives a variety of orders and two prescriptions. In what order should they be implemented?

1. \_\_\_\_\_ Obtain a chest x-ray study.
2. \_\_\_\_\_ Send a lochia specimen for culture.
3. \_\_\_\_\_ Administer the prescribed IV antibiotic.
4. \_\_\_\_\_ Offer the prn acetaminophen (Tylenol) for a fever more than 100° F.
5. \_\_\_\_\_ Document the client's temperature 30 minutes after administering the medications.

# Nursing Care of Women at Risk during Pregnancy, Labor, Childbirth, and the Postpartum Period

174. A 16-year-old adolescent visits the prenatal clinic because she has missed three menstrual periods. Before her physical examination she says, "I don't know what the problem is, but I can't be pregnant." What is the nurse's **most** therapeutic response?

1. "Many young women are irregular at your age."
2. "You probably are pregnant if you had intercourse."
3. "Why did you decide to come to the prenatal clinic?"
4. "Should I ask the health care provider to talk to you?"

175. A teenager at 32 weeks' gestation is hospitalized with preeclampsia. She is anorexic and appears depressed. Which comment indicates to the nurse that further exploration of the client's emotional status is indicated?

1. "I'm tired of feeling so clumsy."
2. "I'll be glad when I can sleep all night."
3. "I dreamed my baby had only one arm."
4. "I was really happy before I got pregnant."

176. A client visiting the prenatal clinic for the first time asks a nurse about the probability of having twins because her husband is one of a pair of fraternal twins. What is the appropriate response by the nurse?

1. "A sonogram will confirm if there is a twin pregnancy."
2. "There is a twenty-five percent probability of having twins."
3. "The husband's history of being a twin increases the chance of having twins."
4. "There is no greater probability of having twins than in the general population."

177. What assessment finding of a pregnant client should alert the nurse to notify the health care provider?

1. Dependent edema at 38 weeks' gestation
2. Fundal height at the umbilicus at 16 weeks' gestation
3. Fetal heart rate of 150 beats/min at 24 weeks' gestation
4. Maternal heart rate of 92 beats/min at 28 weeks' gestation

178. A pregnant client with severe abdominal pain and heavy bleeding is prepared for a cesarean birth. What is the **priority** nursing intervention?

1. Teaching coughing and deep-breathing techniques
2. Sterilizing the surgical site and administering an enema
3. Providing a sterile gown and inserting an indwelling catheter
4. Obtaining an informed consent and assessing for drug allergies

179. A nurse is caring for a client who is having a prolonged labor. The client is annoyed and very concerned because her labor is deviating from what she perceives as normal. After the nurse has acknowledged the client's feelings, what is the next **best** intervention?

1. "I'll leave so you can talk to your partner."
2. "I'll rub your back, and you tell me if it helps."

3. "Let's talk some more about what's really bothering you."
4. "Women usually become weary and frustrated during labor."
180. A client at 26 weeks' gestation is admitted to the high-risk unit with an influenza infection. She is in labor. Which of these instructions should a nurse question?
1. Betamethasone 12 mg IV every 12 hours
  2. I&O and IV Ringer lactate 500 mL/24 hours
  3. Vital signs and fetal heart rate every 30 minutes
  4. Loading dose 4 g IV magnesium sulfate, continue per protocol
181. A client is admitted to the birthing unit in active labor. Cervical dilation has progressed from 2 to 3 cm during an 8-hour period. The health care provider determines that she has hypotonic dystocia, and an infusion of oxytocin (Pitocin) is prescribed to augment her contractions. What is the **most** important nursing action at this time?
1. Checking the perineum for bulging
  2. Documenting the fetal heart rate and its variations
  3. Preparing the client for an emergency cesarean birth
  4. Monitoring the duration and intensity of the contractions
182. A client at 38 weeks' gestation is admitted for induction of labor. Her membranes ruptured 12 hours ago. There are no other signs of labor. Which medication does the nurse anticipate will be prescribed?
1. Oxytocin (Pitocin)
  2. Estrogen (Premarin)
  3. Ergonovine (Ergotrate)
  4. Progesterone (Prometrium)
- ▶183. A client at 39 weeks' gestation is admitted for induction of labor. Knowing that several medications are used to induce labor, a nurse identifies those that may be prescribed. **Select all that apply.**
1. Oxytocin (Pitocin)
  2. Misoprostol (Cytotec)
  3. Ergonovine (Ergotrate)
  4. Carboprost (Hemabate)
  5. Dinoprostone (Prepidil)
184. A client arrives at the clinic in preterm labor and terbutaline (Brethine) is prescribed. For what therapeutic effect should the nurse monitor the client?
1. Increased blood pressure and pulse
  2. Reduction of pain in the perineal area
  3. Gradual cervical dilation as labor progresses
  4. Decreased frequency and duration of contractions
185. A client is receiving magnesium sulfate therapy for severe preeclampsia. What **initial** sign of toxicity should alert the nurse to intervene?
1. Hyperactive sensorium
  2. Increase in respiratory rate
  3. Lack of the knee-jerk reflex
  4. Development of a cardiac dysrhythmia

186. A nurse is monitoring a client with severe preeclampsia who is receiving an infusion of magnesium sulfate. Assessment reveals a pulse rate of 55/minute, respirations of 12/minute, and a flushed face. What is the next nursing action?

1. Continue the infusion and notify the health care provider.
2. Stop the infusion and start an infusion of dextrose and water.
3. Continue the infusion and document the findings on the clinical record.
4. Decrease the rate of the infusion and obtain blood for a magnesium level.

▶187. A client is admitted to the high-risk unit in preterm labor. A loading dose of 6 g of magnesium sulfate over 20 minutes is prescribed to be followed by 2 g/hr. Premixed stock is available with 40 grams of magnesium sulfate in 1000 mL of D5W. At how many milliliters should a nurse set the infusion pump to complete the loading dose? **Indicate your answer in a whole number.**

Answer: \_\_\_\_\_ mL

188. A client admitted with preeclampsia is receiving magnesium sulfate. Which assessment indicates that a therapeutic level of the medication has been reached?

1. Respiratory rate of 12
2. Increased fetal activity
3. Decreased urine output
4. Deep tendon reflexes of +2

189. Despite medication, a client's preterm labor continues, her cervix dilates, and birth appears to be inevitable. Which medication does the nurse anticipate will be prescribed to increase the chance of the newborn's survival?

1. Ritodrine (Yutopar)
2. Misoprostil (Cytotec)
3. Terbutaline (Brethine)
4. Betamethasone (Celestone)

190. A client at 9 weeks' gestation asks the nurse in the prenatal clinic if she can have her chorionic villi sampling (CVS) done at this visit. At what week gestation should the nurse respond is the **best** time for this test?

1. 8 weeks and less than 10 weeks
2. 10 weeks and less than 12 weeks
3. 12 weeks and less than 14 weeks
4. 14 weeks and less than 16 weeks

191. A nurse is assessing a client with a tentative diagnosis of hydatidiform mole. Which clinical finding should the nurse anticipate?

1. Hypotension
2. Decreased fetal heart rate
3. Unusual uterine enlargement
4. Painless, heavy vaginal bleeding

192. A nurse is obtaining the health history from a client with a diagnosis of a ruptured tubal pregnancy. At what point in the pregnancy does the nurse expect the client to state when the low abdominal pain and vaginal bleeding started?

1. At the end of the first trimester

2. About the sixth week of pregnancy
  3. Midway through the second trimester
  4. When the first menstrual period was missed
193. Which sign or symptom leads a nurse to suspect that a client has a tubal pregnancy?
1. A painful mass centered in the abdomen
  2. Lower abdominal cramping for one week
  3. A sharp lower right or left abdominal pain radiating to the shoulder
  4. Leukorrhea or dysuria a few days after the first missed menstrual period
194. A nurse is caring for a client who had a spontaneous abortion. For what complication should the nurse assess this client?
1. Hemorrhage
  2. Dehydration
  3. Hypertension
  4. Subinvolution
195. A nurse is caring for a client who had a spontaneous abortion. The client asks why spontaneous abortions occur. The nurse responds that they are **most** commonly caused by:
1. physical trauma.
  2. unresolved stress.
  3. congenital defects.
  4. embryonic defects.
196. A client tells a nurse in the prenatal clinic that she has vaginal staining but no pain. Her history reveals amenorrhea for the last 2 months and pregnancy confirmation after her first missed period. She is admitted to the high-risk unit because she may be having a spontaneous abortion. What type of abortion is suspected?
1. Missed
  2. Inevitable
  3. Threatened
  4. Incomplete
197. A few hours after being admitted to the hospital with a diagnosis of inevitable abortion, a client, at 16 weeks' gestation, begins to experience bearing-down sensations and suddenly expels the products of conception in bed. What should the nurse do **first**?
1. Notify the health care provider.
  2. Administer the prescribed sedative.
  3. Take the client to the operating room.
  4. Check the client's fundus for firmness.
198. After an incomplete abortion, a client tells a nurse that although her health care provider explained what an incomplete abortion was, she did not understand. What is the nurse's **best** response?
1. "I don't think you should focus on this anymore."
  2. "This is when the fetus dies but is retained in the uterus for at least two months."
  3. "I think it is best if you asked your health care provider for the answer to that question."

4. "This is when the fetus is expelled but other parts of the pregnancy remain in the uterus."
199. A client asks the nurse at the prenatal clinic whether she can continue to have sexual relations while pregnant. What is an indication that the client should refrain from intercourse during pregnancy?
1. Fetal tachycardia
  2. Presence of leukorrhea
  3. Premature rupture of membranes
  4. Being close to expected date of birth
200. An expectant couple asks the nurse about the cause of low back pain in labor. The nurse replies that this pain occurs most often when the position of the fetus is:
1. breech.
  2. transverse.
  3. occiput anterior.
  4. occiput posterior.
201. A laboring client reports low back pain. What should a nurse recommend to the client's coach that will promote comfort?
1. Instruct her to flex her knees.
  2. Place her in the supine position.
  3. Apply pressure to her back during contractions.
  4. Perform neuromuscular control exercises with her.
202. What position should a nurse teach a client to avoid when the client is experiencing back pain during labor?
1. Sims
  2. Sitting
  3. Supine
  4. Side-lying
203. A client arrives at the hospital in the second stage of labor. The head of the fetus is crowning, the client is bearing down, and birth appears imminent. What should the nurse tell the client to do?
1. Pant while pushing gently.
  2. Breathe with her mouth closed.
  3. Hold her breath while bearing down.
  4. Pant while resisting the urge to bear down.
204. A client tells a nurse that she does not want an episiotomy and would rather tear naturally. What information should be offered regarding each birthing method?
1. Lacerations are more painful than an episiotomy.
  2. Lacerations are easier to repair than an episiotomy.
  3. An episiotomy causes less posterior trauma than lacerations.
  4. An episiotomy is preferred over lacerations according to evidence-based practice.
205. A client who had a postpartum hemorrhage is to receive 1 unit of packed red blood cells (RBCs). The nurse manager observes a staff nurse administering the packed RBCs without wearing gloves. What does the nurse manager conclude?

1. Client does not have an infection.
  2. Donor blood is free of bloodborne pathogens.
  3. Nurse should have worn gloves for self-protection.
  4. Nurse was skilled enough to prevent exposure to the blood.
206. Sitz baths are ordered for a client with an episiotomy during the postpartum period. A nurse encourages her to take the sitz baths because they aid the healing process by:
1. promoting vasodilation.
  2. cleansing perineal tissue.
  3. softening the incision site.
  4. tightening the rectal sphincter.
207. An infant is born precipitously in the emergency department. What should the nurse do **first**?
1. Tie and cut the umbilical cord.
  2. Establish an airway for the newborn.
  3. Ascertain the condition of the uterine fundus.
  4. Arrange transport for mother and infant to the birthing unit.
- ▶208. Women who become pregnant for the first time at a later reproductive age (35 years of age or older) are at risk for what complications? **Select all that apply.**
1. Preterm labor
  2. Multiple gestation
  3. Development of seizures
  4. Chromosomal anomalies
  5. Bleeding in the first trimester
209. A primigravida is concerned about the health of her baby and asks the nurse, "What is the most common cause of death of babies?" The nurse explains that the cause of more than half of the neonatal deaths in the United States is due to:
1. atelectasis.
  2. preterm births.
  3. congenital heart disease.
  4. respiratory distress syndrome.
- ▶210. A health care provider orders a contraction stress test (CST) for a client whose nonstress test (NST) was nonreactive. Which maternal complications should alert the nurse to question the order? **Select all that apply.**
1. Hypertension
  2. Preterm labor
  3. Drug addiction
  4. Incompetent cervix
  5. Premature rupture of membrane
211. When caring for a woman who had a positive contraction stress test (CST), what complication does the nurse suspect?
1. Preeclampsia
  2. Placenta previa
  3. Imminent preterm birth

4. Uteroplacental insufficiency

212. What is the **initial** responsibility of a nurse when teaching the pregnant adolescent?

1. Instructing her about the care of an infant
2. Informing her of the benefits of breastfeeding
3. Advising her to watch for danger signs of preeclampsia
4. Encouraging her to continue regularly scheduled prenatal care

213. A nurse is counseling a woman who was just diagnosed with a multiple gestation. Why does the nurse consider this pregnancy as high risk?

1. Postpartum hemorrhage is an expected complication.
2. Perinatal mortality is 2 to 3 times greater in multiple than in single births.
3. Maternal mortality is higher during the prenatal period with a multiple gestation.
4. Optimum adjustment following a multiple birth requires 6 months to 1 year of time.

214. A nurse in the birthing unit is caring for several clients. Which factor should the nurse anticipate will increase the risk for hypotonic uterine dystocia?

1. Twin gestation
2. Gestational anemia
3. Hypertonic contractions
4. Gestational hypertension

215. A client at 28 weeks' gestation has a sonogram. The results reveal a small for gestational age (SGA) fetus and a low-lying placenta. For what complication should the nurse assess this client during the last trimester of pregnancy?

1. Preterm labor
2. Placenta previa
3. Premature separation of the placenta
4. Premature rupture of the membranes

216. A client who is at 26 weeks' gestation tells a nurse at the prenatal clinic that she has pain when urinating, back tenderness, and pink-tinged urine. A diagnosis of pyelonephritis is made. What is the **most** important nursing intervention at this time?

1. Limiting fluid intake
2. Examining her urine for protein
3. Observing for signs of preterm labor
4. Maintaining her on a moderate sodium diet

217. Why does a nurse encourage continued health care supervision for a pregnant woman with pyelonephritis?

1. Preeclampsia frequently occurs after pyelonephritis.
2. Antibiotic therapy should be administered until the urine is sterile.
3. Pelvic inflammatory disease can occur with untreated pyelonephritis.
4. Nutritional needs change to accommodate the prescribed low-protein diet.

218. Sonography of a primigravida who is at 15 weeks' gestation reveals a twin pregnancy. The nurse reviews with the client the risks of a multiple pregnancy that were explained by the health care provider. Which condition does the client identify that indicates the need for further instruction about complications associated with a multiple gestation?

1. Preterm birth
2. Down syndrome
3. Twin to twin transfusion
4. Gestational hypertension

219. A client is scheduled for a sonogram at 36 weeks' gestation. Shortly before the test she tells the nurse that she has severe abdominal pain. Assessment reveals heavy vaginal bleeding, a drop in blood pressure, and an increased pulse rate. What complication does the nurse suspect?

1. Hydatidiform mole
2. Vena caval syndrome
3. Marginal placenta previa
4. Complete abruptio placentae

220. A client at 37 weeks' gestation arrives at the emergency department stating that she has abdominal pain but no vaginal bleeding. The health care provider diagnoses abruptio placentae. The client asks the nurse why it is so painful. What should the nurse consider is the **initial** cause of the abdominal pain before responding in language the client will understand?

1. Hemorrhagic shock
2. Concealed hemorrhage
3. Blood in the myometrium
4. Disseminated intravascular coagulation

221. A client at 37 weeks' gestation is admitted to the birthing unit from the emergency department. She had arrived by ambulance following a motor vehicle accident. Her vital signs are BP: 90/60; P: 108; R: 24. She is reporting sharp abdominal pain. What is the **priority** nursing intervention at this time?

1. Apply an electronic fetal monitor.
2. Prepare for a possible cesarean birth.
3. Draw blood for a type and crossmatch.
4. Assess the amount of vaginal bleeding.

222. A client who had a severe abruptio placentae asks the nurse why there was so much bleeding. What should the nurse consider is the cause of the heavy bleeding before responding in language the client will understand?

1. Polycythemia
2. Thrombocytopenia
3. Hyperglobulinemia
4. Hypofibrinogenemia

223. A nurse is reviewing the obstetric history of a client who had an abruptio placentae. What prenatal condition does the nurse expect the client to have had?

1. Cardiac disease
2. Hyperthyroidism
3. Gestational hypertension
4. Cephalopelvic disproportion

224. A client arrives at the hospital at 38 weeks' gestation with profuse vaginal bleeding.

She states that it occurred suddenly without any contractions. Which condition may the client be experiencing that requires immediate notification of the health care provider?

1. Placenta previa
2. Placenta accreta
3. Ruptured uterus
4. Concealed abruptio

225. What nursing intervention should be included when caring for a client with placenta previa?

1. Vital signs at least once per shift
2. Tap water enema before the birth
3. Documentation of the amount of bleeding
4. Limited ambulation until the bleeding stops

226. A pregnant woman who is in the third trimester arrives in the emergency department with vaginal bleeding. She states that she snorted cocaine approximately 2 hours ago. Which complication does the nurse suspect is the cause of the bleeding?

1. Placenta previa
2. Tubal pregnancy
3. Abruptio placentae
4. Spontaneous abortion

227. A nurse is counseling a client who is experiencing preterm contractions in the 35th week of gestation and whose cervix is dilated 2 cm. What should the nurse teach this client about sexual intercourse at this time?

1. Should be limited to once a week
2. Is prohibited because it may stimulate labor
3. Should be restricted to the side-lying position
4. Is permitted as long as penile penetration is shallow

228. A client pregnant with twins is told by the health care provider that she is at risk for postpartum hemorrhage. Later, the client asks the nurse why she is at risk for hemorrhage. What should the nurse consider is the cause of the postpartum hemorrhage before responding in language the client will understand?

1. Uterine atony
2. Mediolateral episiotomy
3. Lacerations of the cervix
4. Retained placental fragments

229. A client in labor at 39 weeks' gestation is told by the health care provider that she will need a cesarean birth. The nurse reviews the client's prenatal history. What preexisting condition is the **most** likely reason for the cesarean birth?

1. Gonorrhea
2. Chlamydia
3. Chronic hepatitis
4. Active genital herpes

230. A nurse notifies the health care provider that a client has been admitted to the high-risk unit in her 36th week of gestation. She is bleeding, has severe abdominal pain and a

rigid fundus, and is demonstrating signs of shock. For what intervention should the nurse prepare?

1. A high-forceps birth
2. An immediate cesarean birth
3. The insertion of an internal fetal monitor
4. The administration of an oxytocin infusion

231. A nurse in the birthing suite has just admitted four clients. Which client should the nurse anticipate will need to be prepared for a cesarean birth?

1. Multipara with a shoulder presentation
2. Multipara with a documented station of "floating"
3. Primigravida with a fetus presenting in the occiput posterior position
4. Primigravida with a twin gestation with the lowermost in the vertex presentation

232. During the first hour after a cesarean birth, a nurse observes that the client's lochia has saturated one perineal pad. Based on the knowledge of expected lochial flow, what should the nurse conclude that this indicates?

1. Scant lochial flow
2. Postpartum hemorrhage
3. Retained placental fragments
4. Lochial flow within expected limits

233. Which client should the nurse identify is at risk for developing a hypertensive disorder of pregnancy?

1. Primigravida who is obese
2. Multipara who is 31 years old
3. Multipara who had more than six previous pregnancies
4. Primigravida who took oral contraceptives within 3 months of conception

234. A client in the prenatal clinic is diagnosed with preeclampsia. What clinical findings support this diagnosis?

1. Elevated blood pressure of 150/100 mm Hg
2. Elevated blood pressure that is accompanied by a headache
3. Blood pressure above the baseline while fluctuating at each reading
4. Blood pressure more than 140 mm Hg systolic accompanied by proteinuria

235. A client is admitted to the birthing suite with a blood pressure of 150/90 mm Hg, 3+ proteinuria, and edema of the hands and face. A diagnosis of severe preeclampsia is made. What other clinical findings support this diagnosis? **Select all that apply.**

1. Headache
2. Constipation
3. Abdominal pain
4. Vaginal bleeding
5. Visual disturbances

236. A nurse is monitoring a client with severe preeclampsia for the onset of eclampsia. What clinical finding indicate an impending seizure?

1. Persistent headache with blurred vision
2. Epigastric pain with nausea and vomiting

3. Spots with flashes of light before the eyes
  4. Rolling of the eyes to one side with a fixed stare
237. A client with the diagnosis of severe preeclampsia is admitted to the hospital from the emergency department. What precaution should the nurse initiate?
1. Pad the side rails on the bed.
  2. Place the call button next to the client.
  3. Have oxygen with face mask available.
  4. Assign a nursing assistant to stay with the client.
238. When does a nurse caring for a client with eclampsia determine that the risk for another seizure has subsided?
1. After birth occurs
  2. After labor begins
  3. 48 hours postpartum
  4. 24 hours postpartum
239. During an emergency birth the fetal head is crowning on the perineum. How should a nurse support the head as it is being born?
1. Apply suprapubic pressure
  2. Place a hand firmly against the perineum
  3. Distribute the fingers evenly around the head
  4. Maintain pressure against the anterior fontanel
240. What is the safest position for a woman in labor when a nurse observes a prolapsed cord?
1. Prone
  2. Fowler
  3. Lithotomy
  4. Trendelenburg
241. A nurse in the prenatal clinic is caring for a client with heart disease who is in the second trimester. What hemodynamic of pregnancy may affect the client at this time?
1. Decrease in the number of RBCs
  2. Gradually increasing size of the uterus
  3. Heart rate acceleration in the last half of pregnancy
  4. Increase in cardiac output during the third trimester
242. A pregnant client with class II heart disease is concerned that her pregnancy will be an added burden on her already compromised heart. A nurse explains that during pregnancy the cardiac system is **most** compromised during the:
1. first trimester.
  2. third trimester.
  3. transitional phase of labor.
  4. first two days after the birth.
243. A pregnant client with a history of rheumatic heart disease since childhood is concerned about the birth of her baby and asks what to expect. What should a nurse explain about the birth? **Select all that apply.**
1. Labor may be induced.

2. Birth may be midforceps assisted.
  3. Birth may be vacuum extraction assisted.
  4. Regional anesthesia may be administered.
  5. Inhalation anesthesia may be administered.
244. A client with class I heart disease is admitted to the birthing suite in active labor. In what position should the nurse place the client?
1. High Fowler
  2. Semi Fowler
  3. Left lateral with head elevated
  4. Right lateral with head elevated
245. What nursing intervention is specific for clients with cardiac problems who are in active labor?
1. Encouraging frequent voiding
  2. Monitoring the blood pressure hourly
  3. Auscultating the lungs for crackles every 30 minutes
  4. Helping to turn from side to side at 15-minute intervals
246. The nurse is counseling a pregnant client with type 1 diabetes about medication changes as pregnancy progresses. Which medication will be needed in increased dosages during the second half of her pregnancy?
1. Insulin
  2. Antihypertensives
  3. Pancreatic enzymes
  4. Estrogenic hormones
247. What should a nurse anticipate about the insulin requirements of a client with diabetes on her first postpartum day?
1. A rapid increase
  2. Will remain unchanged
  3. A sharp and sudden decrease
  4. Will decrease slowly and steadily
248. During the second postpartum hour after a long labor and birth, a nurse identifies that the client has heavy vaginal bleeding that does not diminish after fundal massage. The client states, "I am so thirsty. Can I have some ginger ale?" How should the nurse reply?
1. "It is good to regain your fluids. I will bring some for you right now."
  2. "I can imagine how thirsty you are. However, I must get an order before giving you any fluid."
  3. "Your fluid level should return to normal as quickly as possible. The blood loss can begin to balance if you drink enough fluids."
  4. "As difficult as it is, it is best for you to wait for the bleeding to subside. I can give you a moisturizer for your lips to relieve the dryness."
249. A client who has six living children has just given birth. After the expulsion of the placenta, an infusion of lactated Ringer solution with 10 units of oxytocin (Pitocin) is prescribed. What should the nurse explain to the client when asked why this infusion is

needed?

1. "You had a precipitous birth."
2. "This is required for an extramural birth."
3. "It will help expel the retained placental fragments."
4. "Your uterus may have a relaxed tone after multiple pregnancies."

250. A nurse is assessing several postpartum clients. Which clients are at risk for developing postpartum hemorrhage? **Select all that apply.**

1. Twin birth
2. Overdistended bladder
3. Hypertonic uterine dystocia
4. Retained placental fragments
5. Mild gestational hypertension

251. A nurse is reviewing a client's history. What two predisposing causes of puerperal (postpartum) infection should alert the nurse to monitor this client?

1. Malnutrition and anemia
2. Hemorrhage and trauma during labor
3. Preeclampsia and retention of placental fragments
4. Organisms in the birth canal and trauma during labor

252. A nurse is assessing the apical and radial pulses of a postpartum client 3 hours after the birth of her second child. Which clinical finding does the nurse expect?

1. Thready pulse
2. Slow heartbeat
3. Bounding pulse
4. Irregular heartbeat

253. During the postpartum period it is expected for women to have an increased cardiac output with tachycardia. This knowledge should motivate a nurse who is caring for a client with cardiac problems to monitor for:

1. an irregular pulse.
2. respiratory distress.
3. hypovolemic shock.
4. an increase in vaginal bleeding.

254. How should a nurse screen a newborn of a diabetic mother for hypoglycemia?

1. Test for glucose tolerance.
2. Draw blood for a serum glucose level.
3. Arrange for a fasting blood glucose level.
4. Test heel blood with a glucose-oxidase strip.

255. What does a nurse anticipate will be provided for a newborn of a mother with a history of long-standing diabetes?

1. Fast-acting insulin
2. Special high-risk care
3. Routine newborn care
4. Limited glucose intake

256. A nurse anticipates that newborns of mothers who have diabetes often have

tremors, periods of apnea, cyanosis, and poor sucking ability. With what complication are these signs associated?

1. Hypoglycemia
2. Hypercalcemia
3. Central nervous system edema
4. Congenital depression of the islets of Langerhans

# Nursing Care of the Newborn

257. An infant is born with a bilateral cleft palate. Plans are made to begin reconstruction immediately. What nursing intervention should be included to promote parent-infant attachment?

1. Demonstrating a positive acceptance of the infant
2. Placing the infant in a nursery away from view of the general public
3. Explaining to the parents that the infant will look normal after the surgery
4. Encouraging the parents to limit contact with the infant until after the surgery

258. After an 8 hour, uneventful labor, a client gives birth. After an airway is ensured and the neonate is dried and wrapped in a blanket, the nurse places the newborn in the mother's arms. The mother asks, "Is my baby normal?" What is the nurse's **best** response?

1. "Most babies are normal; of course your baby is."
2. "Your baby must be all right; listen to that strong cry."
3. "Yes, because your entire pregnancy has been so normal."
4. "We will unwrap your baby; now you can see for yourself."

259. What should supportive nursing care in the beginning mother-infant relationship include?

1. Suggesting the mother choose breastfeeding instead of formula feeding
2. Encouraging the mother to assist with simple aspects of her newborn's care
3. Advising the mother to participate in rooming-in with the newborn at the bedside
4. Observing the mother/infant interaction unobtrusively to evaluate the relationship

260. Which behavior indicates to a nurse that a new mother is in the taking-hold phase?

1. Calling the baby by name
2. Talking about the labor and birth
3. Touching the baby with her fingertips
4. Being involved with her need to eat and sleep

261. What is the **most** important factor for a nurse to consider when selecting nursing measures to help parent-child relationships during the immediate postpartum period?

1. Physical status of the infant
2. Duration and difficulty of the labor
3. Anesthesia during the labor process
4. Health and emotional status during the pregnancy

262. When caring for a family on a postpartum unit, a nurse must consider that parenting includes all the tasks, responsibilities, and attitudes that make up child care and that either parent can exhibit these qualities. Which factor is the **most** important influence on parenting ability?

1. Inborn instincts
2. Marriage with flexible roles
3. Childhood roles and concepts
4. Education about growth and development

263. A pilot program is being developed to assist new mothers who are at risk for

mother-infant relationship problems. Which mother's situation would make her a candidate for the program?

1. The pregnancy was not planned.
2. There are negative feelings about the birth experience.
3. The pregnancy elicited ambivalent feelings during the first trimester.
4. There was a preference for one sex, but she gave birth to a baby of the other sex.

264. A mother is concerned that her newborn may be exposed to communicable diseases when she goes home. When teaching the mother ways to decrease the risk of infection, what type of immunity should the nurse explain was transferred to her baby through the placenta?

1. Active natural
2. Passive natural
3. Active artificial
4. Passive artificial

265. A client is rooming-in with her newborn. A nurse observes the infant lying quietly in the bassinet with eyes opened wide. What action should the nurse take in response to the infant's behavior?

1. Brighten the lights in the room.
2. Wrap and then turn the infant to the side.
3. Encourage the mother to talk to her baby.
4. Begin the physical and behavioral assessments.

266. A nurse who is assessing a newborn 1 minute after birth determines that the cry is lusty, the heart rate is 150 beats/min, and the extremities are flexed, but the bottoms of the feet have a marked bluish tinge. What Apgar score does the nurse assign to the neonate? **Record your answer using a whole number.**

Answer: \_\_\_\_\_

267. What is a nurse's **primary** critical observation when performing an assessment for determining an Apgar score?

1. Heart rate
2. Respiratory rate
3. Presence of meconium
4. Evaluation of Moro reflex

268. A nurse who is assessing a newborn 3 minutes after birth takes into consideration that the heart rate of a healthy, alert neonate may range between:

1. 120 and 180 beats/min.
2. 130 and 170 beats/min.
3. 110 and 160 beats/min.
4. 100 and 130 beats/min.

269. In a noisy room a sleeping newborn initially startles and has rapid movements but soon goes back to sleep. What is the **most** appropriate nursing action in response to this behavior?

1. Accept the infant's behavior.
2. Assess the infant's vital signs.

3. Test the infant's ability to hear.
  4. Stimulate the infant's respirations.
270. Neonates have difficulty maintaining their body temperature. However, they have several mechanisms to help them maintain it. Which ones should a nurse consider when caring for a newborn? **Select all that apply.**
1. Flexed fetal position
  2. Hepatic insulin stores
  3. Brown fat metabolism
  4. Peripheral vasoconstriction
  5. Parasympathetic nervous system
271. A nurse is assessing a newborn's respirations. What clinical findings indicate that the respirations are within the expected range?
1. Regular, thoracic, 40 to 60/min
  2. Irregular, thoracic, 30 to 60/min
  3. Regular, abdominal, 40 to 50/min
  4. Irregular, abdominal, 30 to 60/min
272. At the beginning of the first formula feeding a newborn begins to cough and choke, and the lips become cyanotic. What is the immediate nursing action?
1. Stimulate crying.
  2. Suction and then oxygenate.
  3. Substitute the formula with sterile water.
  4. Stop the feeding momentarily and then restart.
273. At 10 hours of age a neonate's oral cavity is filled with mucus and cyanosis develops. What should the nurse do **first**?
1. Suction.
  2. Administer oxygen.
  3. Record the incident.
  4. Insert a nasogastric tube.
274. Which behavior should a nurse identify as the Moro reflex response?
1. Extension and adduction of the arms
  2. Abduction and then adduction of the arms
  3. Adduction of the arms and fanning of the toes
  4. Extension of the arms and curling of the fingers
275. A newborn has small, whitish, pinpoint spots over the nose that are caused by retained sebaceous secretions. When documenting this observation, a nurse identifies them as:
1. milia.
  2. lanugo.
  3. whiteheads.
  4. mongolian spots.
276. A nurse observes a healthy newborn lying in the supine position with the head turned to the side and legs and arms extended on the same side and flexed on the opposite side. Which reflex does the nurse identify?

1. Moro
2. Babinski
3. Tonic neck
4. Palmar grasp

277. An infant's intestines are sterile at birth, thus lacking the bacteria necessary for the synthesis of:

1. bilirubin.
2. bile salts.
3. prothrombin.
4. intrinsic factor.

278. Which should the nurse explain to a new mother will be delayed until her newborn is 36 to 48 hours old?

1. Vitamin K injection
2. Test for blood glucose level
3. Test for necrotizing enterocolitis
4. Screening for phenylketonuria

279. A nurse teaches a group of postpartum clients that all their newborns will be screened for phenylketonuria (PKU) to:

1. assess protein metabolism.
2. reveal potential retardation.
3. detect chromosomal damage.
4. identify thyroid insufficiency.

280. When assessing a 9-lb neonate 2 hours after birth, a nurse identifies jitteriness, apneic episodes, tachycardia, and temperature instability. What complication do these findings indicate to the nurse?

1. Hyponatremia
2. Hypoglycemia
3. Cardiac defect
4. Immature CNS

281. The practice of separating parents and their newborn immediately after birth and limiting their time with their newborn in the first few days contradicts studies based on:

1. early rooming-in.
2. taking-in behaviors.
3. taking-hold behaviors.
4. parent-child attachment.

282. After birth, when inspecting her newborn, a mother notices a discharge from the nipple of both of her infant's breasts. She asks why this is happening. How should the nurse respond?

1. "It is an effect from maternal hormones."
2. "It is caused by Monilia contracted during birth."
3. "There may be a congenital hormonal imbalance."
4. "There was a uterine infection during the pregnancy."

283. While a mother is inspecting her newborn she expresses concern that her baby's

eyes are crossed. How should the nurse respond?

1. "Take another look. They seem fine to me."
2. "It's all right. Most babies have crossed eyes."
3. "This is expected. Your baby is trying to focus."
4. "You're right. I'll contact your health care provider."

284. A nurse decides on a teaching plan for a new mother and her infant. What should the plan include?

1. Schedule for teaching infant care
2. Demonstration and explanation of infant care
3. Discussion of mothering skills in a nonthreatening manner
4. Emotional support and dependence on the nurse's expertise

285. A client asks the nurse what advantage breastfeeding has over formula feeding.

What major group of substances in human milk are of special importance to the newborn and cannot be reproduced in a bottle formula?

1. Amino acids
2. Gamma globulins
3. Essential electrolytes
4. Complex carbohydrates

286. A nurse is testing a newborn's heel blood for the level of glucose. Which newborns does the nurse anticipate will experience hypoglycemia? **Select all that apply.**

1. Preterm infants
2. Infants with Down syndrome
3. Small-for-gestational-age infants
4. Large-for-gestational-age infants
5. Appropriate-for-gestational-age infants

287. Which newborn assessment identified immediately after birth will probably necessitate prolonged follow-up care?

1. Apgar score of 5
2. Weight of 3500 grams
3. Blood glucose level of 50 mg/dL
4. Umbilical cord with 2 blood vessels

288. A neonate at 1 minute after birth has a weak cry, a heart rate of 90 beats/min, some flexion of the extremities, grimacing, and acrocyanosis. What is the Apgar score for this neonate? **Record your answer using a whole number.**

Answer: \_\_\_\_\_

289. A newborn's Apgar score at 5 minutes is 5. With what condition does a low Apgar score at 5 minutes after birth correlate that requires intensive monitoring of this neonate?

1. Cerebral palsy
2. Genetic defects
3. Mental retardation
4. Neonatal morbidity

290. During the initial assessment of a newborn the nurse suspects a congenital heart

defect. Which clinical manifestations support this suspicion? **Select all that apply.**

1. Nasal flaring
2. Sternal retractions
3. Grunting respirations
4. Short periods of apnea
5. Cyanotic hands and feet
6. Heart rate of 160 beats/min

291.▶ An infant born in the 36th week of gestation weighs 4 lb 3 oz (2062 g) and has Apgar scores of 7/9. What nursing actions will be performed upon admission to the nursery?

**Select all that apply.**

1. Recording vital signs
2. Administering oxygen
3. Offering a bottle of dextrose in water
4. Evaluating the neonate's health status
5. Supporting the neonate's body temperature

292. A nurse is teaching a group of new mothers about breastfeeding. Which factor that influences the availability of milk in the lactating woman should the nurse include in the teaching?

1. Age of the woman at the time of the birth
2. Distribution of erectile tissue in the nipples
3. Amount of milk products consumed during pregnancy
4. Viewpoint of the woman's family toward breastfeeding

293. While teaching a prenatal class about infant feeding, the nurse is asked a question about the relationship between the size of breasts and breastfeeding. How should the nurse respond?

1. "Breast size is not related to milk production."
2. "Motivated women tend to breastfeed successfully."
3. "You seem to have some concern about breastfeeding."
4. "Glandular tissue in the breasts determines the amount of milk produced."

294. A woman learning about infant feedings asks a nurse how anyone who is breastfeeding gets anything done with a baby on demand feedings. Which is the **best** response by the nurse?

1. "Most mothers find that feeding the baby whenever the baby cries works out fine."
2. "Perhaps a schedule might be better because the baby is already accustomed to the hospital routine."
3. "Babies on demand feedings eventually set a schedule, so there should be time for you to do other things."
4. "Most breastfeeding mothers find that their babies do better on demand because the amount of milk ingested may vary at each feeding."

295. A nurse is caring for four clients who each have one of the following conditions. Which client should the nurse anticipate will be instructed not to breastfeed by the health care provider?

1. Mastitis

2. Inverted nipples
3. Herpes genitalis
4. Human immunodeficiency virus

296. A nurse is teaching breast care to a client who is breastfeeding. Which client statement indicates that the teaching was effective?

1. "I should air dry my nipples after each feeding."
2. "Mild soap is appropriate for washing my breasts."
3. "My breast pads should be lined with plastic shields."
4. "I will remove my brassiere before I go to bed at night."

297. A client who is breastfeeding is being discharged. The client tells the nurse that she is worried because her neighbor's breasts "dried up" when she got home and she had to discontinue breastfeeding. What should the nurse reply?

1. "Once lactation is established, this rarely happens."
2. "You have little to worry about because you already have a good milk supply."
3. "This can happen with the excitement of going home, but putting the baby to breast more often should reestablish lactation."
4. "This commonly happens, so we will give you a bottle of formula to take home then the baby won't go hungry until your milk supply returns."

298. A nurse is teaching breastfeeding to a client. Which client statement indicates the need for further instructions?

1. "I will try to empty my breasts at each feeding."
2. "I will start with an alternate breast at each feeding."
3. "My breasts should be washed with soapy water before I breastfeed."
4. "My baby's cheek should be stroked gently when I am ready to breastfeed."

299. What should be included in a plan of care to limit the development of hyperbilirubinemia in the breastfed neonate?

1. Encouraging more frequent breastfeeding during the first 2 days
2. Instituting phototherapy for 30 minutes every 6 hours for 3 days
3. Substituting breastfeeding with formula feeding on the second day
4. Supplementing breastfeeding with glucose-water during the first day

300. Two days after being discharged a new mother calls the clinic stating that she is not sure if her baby is receiving enough breast milk. What information does the nurse need to determine if the infant is being fed adequately?

1. Voids 4 times before 2 PM
2. Sleeps  $3\frac{1}{2}$  to 4 hours between feedings
3. Has at least 2 or more bowel movements a day
4. Nurses 5 minutes on the first breast and 10 on the other

301. What client behavior indicates to the nurse that a woman needs further teaching about breastfeeding her newborn?

1. When she leans forward to place her breast into the infant's mouth
2. If she holds the infant level with her breast while in a side-lying position
3. If she touches her nipple to the infant's cheek at the beginning of the feeding
4. When she puts her finger in the infant's mouth to break the suction after the feeding

302. A 2-day-old infant who weighs 6 lb (2722 g) is fed formula every 4 hours. Newborns need about 73 mL of fluid per pound of body weight each day. Based on this information, approximately how much formula should the infant receive at each feeding?

1. 1 to 2 oz
2. 2 to 3 oz
3. 3 to 4 oz
4. 4 to 5 oz

303. A client asks about the difference between cow's milk and breast milk. The nurse should respond that cow's milk differs from human milk in that it contains:

1. less protein, less calcium, and more carbohydrates.
2. less protein, more calcium, and more carbohydrates.
3. more protein, less calcium, and fewer carbohydrates.
4. more protein, more calcium, and fewer carbohydrates.

304. While performing bag and mask ventilation on a newborn, a nurse does not see the newborn's chest rise. Place the following interventions in order of their priority.

1. \_\_\_\_\_ Reposition the head.
2. \_\_\_\_\_ Open the mouth slightly.
3. \_\_\_\_\_ Apply the mask for a better seal.
4. \_\_\_\_\_ Suction the mouth if there are secretions.
5. \_\_\_\_\_ Assess the neonate's response to these measures.

305. At 12 weeks' gestation, a client who is Rh negative expels the total products of conception. What is the nursing action after it has been determined that she has not been previously sensitized?

1. Administer RhoGAM within 72 hours.
2. Make certain that RhoGAM is administered at the first clinic visit.
3. Withhold the RhoGAM, because the gestation lasted only 12 weeks.
4. Withhold the RhoGAM, because it is not used after the birth of a stillborn.

306. A client who has type O Rh-positive blood gives birth. The neonate has type B Rh-negative blood. When the nurse assesses the neonate 11 hours after birth, the infant's skin appears yellow. What is the **most** likely cause?

1. Neonatal sepsis
2. Rh incompatibility
3. Physiologic jaundice
4. ABO incompatibility

307. A nurse in the newborn nursery observes a yellowish skin color of an infant whose mother had a cesarean birth. What is the **immediate** nursing action?

1. Notify the health care provider.
2. Ascertain how many hours ago the neonate was born.
3. Take a heel blood sample and send it to the laboratory.
4. Cover the eyes and place the neonate under high-intensity light.

308. A primigravida has just given birth. The nurse is aware that she has type AB Rh-negative blood. Her newborn's blood type is B positive. What should the plan of care include?

1. Determining the father's blood type
  2. Preparing for a maternal blood transfusion
  3. Observing the newborn for signs of ABO incompatibility
  4. Obtaining an order to administer RhoGAM to the mother
309. A nurse is assessing a newborn for signs of hyperbilirubinemia (pathologic jaundice). What clinical finding confirms this complication?
1. Neurologic signs during the first 24 hours
  2. Muscular irritability within 1 hour after birth
  3. Jaundice developing between the first 12 and 24 hours
  4. Jaundice developing between 48 and 72 hours after birth
310. The nurse is differentiating between cephalohematoma and caput succedaneum. What finding is unique to caput succedaneum?
1. Scalp over the area is tender.
  2. Edema crosses the suture line.
  3. Edema increases during the first day.
  4. Scalp over the area becomes ecchymosed.
311. For what complication should a nurse assess a newborn after a precipitate birth?
1. Brachial palsy
  2. Dislocated hip
  3. Fractured clavicle
  4. Intracranial hemorrhage
312. A preterm neonate admitted to the neonatal intensive care nursery (NICU) has muscle twitching, seizures, cyanosis, abnormal respirations, and a short, shrill cry. What complication does the nurse suspect?
1. Tetany
  2. Spina bifida
  3. Hyperkalemia
  4. Intracranial hemorrhage
313. An infant is born in the breech position and assessment of the newborn indicates the presence of Erb palsy (Erb-Duchenne paralysis). What clinical manifestation supports this conclusion?
1. Absent grasp reflex on the affected side
  2. Negative Moro reflex on the unaffected side
  3. Inability to turn the head to the unaffected side
  4. Flaccid arm with the elbow extended on the affected side
314. What should nursing care for the affected arm of an infant born with Erb-Duchenne paralysis (brachial palsy) include?
1. Keeping it immobilized
  2. Measuring the length of the arm daily
  3. Teaching the parents to manipulate the arm muscles
  4. Starting passive range of motions exercises immediately
315. A newborn has a diagnosis of Erb palsy (Erb-Duchenne paralysis). What does a nurse identify as the cause of this complication?

1. A disease acquired in utero
  2. An X-linked inheritance pattern
  3. A tumor arising from muscle tissue
  4. An injury to the brachial plexus during birth
316. A newborn has an asymmetric Moro reflex. What does a nurse identify as a cause of this problem?
1. Down syndrome
  2. Cranial nerve damage
  3. Cerebral or cerebellar birth injuries
  4. Brachial plexus, clavicular, or humeral birth injuries
317. A nurse suspects that a newborn is experiencing opioid withdrawal. Which assessment supports this suspicion?
1. Lethargy and constipation
  2. Grunting and low-pitched cry
  3. Irritability and nasal congestion
  4. Watery eyes and rapid respirations
318. For what should a nurse assess in a newborn of a mother who is known to abuse opioids?
1. Dehydration
  2. Hyperactivity
  3. Hypotonicity of muscles
  4. Prolonged periods of sleep
319. A nurse in the clinic assesses that a 4-day-old neonate who was born at home has a purulent discharge from the eyes. What condition does the nurse suspect ?
1. A *Chlamydia trachomatis* infection
  2. Human immunodeficiency virus (HIV)
  3. Retinopathy of prematurity (retrolental fibroplasia)
  4. A reaction to the ophthalmic antibiotic instilled after birth
320. An infant develops purulent conjunctivitis on the fourth day of life and is brought to the emergency department. What is the **priority** nursing action?
1. Assess for signs of pneumonia.
  2. Secure an order for allergy testing of the infant.
  3. Bathe the infant's eyes with tepid boric acid solution.
  4. Teach the mother to wash her hands before touching the infant.
321. What should the care of a newborn infant whose mother has had untreated syphilis since the second trimester of pregnancy include?
1. Examining for a cleft palate
  2. Testing for congenital syphilis
  3. Assessing for muscle hypotonicity
  4. Observing for maculopapular lesions of the soles
322. A nurse must continuously monitor a preterm infant's temperature and provide appropriate nursing care because unlike the full-term infant, the preterm infant:
1. cannot use shivering to produce heat.

2. cannot break down glycogen to glucose.
  3. has a limited supply of brown fat available to provide heat.
  4. has a limited amount of pituitary hormones to control internal heat.
323. A nurse must meet the hydration needs of a preterm infant. What should the nurse consider about the preterm infant's kidney function?
1. Large amounts of urine are excreted.
  2. It is the same as in a full-term newborn.
  3. Urine is concentrated with an elevated specific gravity.
  4. Acid-base and electrolyte balance are adequately maintained.
324. What is the **most** common complication for which a nurse must monitor preterm infants?
1. Hemorrhage
  2. Brain damage
  3. Respiratory distress
  4. Aspiration of mucus
325. A nurse is caring for preterm infants with respiratory distress in the neonatal intensive care unit (NICU). What is the **priority** nursing action?
1. Limit caloric intake to decrease metabolic rate.
  2. Maintain the prone position to prevent aspiration.
  3. Limit oxygen concentration to prevent eye damage.
  4. Maintain a high-humidity environment to promote gas exchange.

## Answers and Rationales

---

# **Nursing Care to Promote Childbearing and Women's Health**

**1. 2 Nurses who counsel clients about abortion should know what services are available and the various methods that are used to induce abortion. Nurses who cannot control their negative feelings toward abortion should not counsel women who are thinking of undergoing the procedure.**

**1** Nursing practice necessitates knowledge of research results; statements must be based on fact, not personal feelings or beliefs. **3** The nurse should give the client only the information requested and should not state personal feelings. **4** The nurse is responsible for giving information about abortion and need not defer to the health care provider.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 23, Induced Abortion, Nursing Care

**2. 3 This response is a positive negotiation to be reassigned to an area where the nurse's personal values will not pose a problem.**

**1** This is an ineffective way to resolve value conflict; undoubtedly, a client would sense this conflict. **2** The nurse may not have the legal, ethical, or professional right to refuse this assignment if employed by the facility. **4** Imposing this kind of advice is unethical and unprofessional.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Contraceptive Methods, Nursing Care

**3. 4 The client must feel comfortable enough to verbalize her feelings; this helps to complete the grieving process.**

**1** This is a false assumption. **2** Induced abortion is a sterile procedure and should not predispose the client to postoperative infection. **3** Studies show that contraceptive counseling at this time is most important, because the client may not return after the abortion.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 23, Induced Abortion, Nursing Care

**4. 2 Because mothering is not an inborn instinct in humans, almost all mothers, including multiparas, report some ambivalence and anxiety about their mothering ability.**

**1** Frequently maternal feelings are nurtured by the sight of the infant. **3** The length of time it takes to develop these feelings is specific for each individual. With some mothers it may take a much longer time. **4** Ambivalent feelings are universal in response to a neonate.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**5. 3 Although support may help minimize guilt, it will not eliminate it; however, support will sustain family cohesion and unity.**

1 Support may help, but it does not completely alleviate guilt feelings. 2 Support does not affect the legal responsibility of the parents. 4 This may help, but it cannot completely relieve pressure.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Induced Abortion, Nursing Care

6. 2 Some type of a barrier contraceptive (condom with foam or jelly or a diaphragm) is usually recommended for the client with diabetes and heart disease.

1 Oral contraceptives are not recommended for this client because of their tendency to alter glucose tolerance. 3 An IUD is not recommended because it may predispose this client to infection. 4 Clients with heart disease can become pregnant again in the future.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Contraceptive Methods, Nursing Care

7. 4 Subsequent to IUD insertion there may be an excessive menstrual flow for several cycles; because the IUD is a foreign body, there is an increase in the blood supply as a result of the inflammatory process.

1 There is no documentation of this. 2 This may occur on insertion but is uncommon. 3 This may occur, but it is not classified as a side effect.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Contraceptive Methods, Data Base

8. 2 The IUD may cause irritability of the myometrium, inducing contraction of the uterus and expulsion of the device.

1 This is a rare, rather than a common, occurrence. 3 Clients do not report discomfort during coitus when an IUD is in place. 4 Increased vaginal infections are not reported with the use of an IUD.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Contraceptive Methods, Data Base

9. 4 Intrauterine devices produce a spermicidal intrauterine environment; a copper IUD (ParaGard T380A) inflames the endometrium, damaging or killing sperm and preventing fertilization and/or implantation; a Mirena IUD (LNG-IUS) releases levonorgestrel, damaging sperm and causing the endometrium to atrophy, thus preventing fertilization and/implantation.

1 A diaphragm blocks the cervical os. 2 This is not the action of an IUD. 3 This is the function of a condom.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Contraceptive Methods, Data Base

10. 3 The ovum is capable of being fertilized for 24 to 36 hours following ovulation; after this time it travels a variable distance between the fallopian tube and uterus, and if not

**fertilized, disintegrates and is phagocytized by leukocytes.**

**1, 2** The ovum is viable a longer time. **4** The ovum is not fertilizable after 36 hours.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Menstrual Cycle

**11. 1** As ovulation approaches there may be a drop in the basal temperature because of an increased production of estrogen; when ovulation occurs there will be a rise in the basal temperature because of an increased production of progesterone.

**2** At ovulation the temperature rises after a slight drop. **3** At ovulation the temperature drop is slight, not marked. **4** At ovulation the temperature drops slightly and then rises.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Contraceptive Methods, Data Base

**12. 3** Breakthrough bleeding commonly occurs when clients begin taking oral contraceptives; it is midcycle bleeding, and if it persists, the dosage should be changed.

**1** Cervicitis is unrelated to oral contraceptive use. **2** At this time there is no evidence that ovarian cysts are related to oral contraceptive use. **4** Fibrocystic breast disease is unrelated to oral contraceptive use.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Contraceptive Methods, Data Base

**13. 4** Some spermatozoa will remain viable in the vas deferens for a variable time after vasectomy.

**1** There has been some success in reversing this procedure. **2** Precautions must be taken to prevent fertilization until absence of sperm in the semen has been verified. **3** The procedure does not affect sexual functioning.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Contraceptive Methods, Nursing Care

**14. 1** Although unusual, conception can occur during menses.

**2** The pill prevents ovulation and therefore conception. However, the pill does not protect a female from being exposed to a sexually transmitted microorganism. **3** Sperm do not survive in a large body of water. **4** Condoms provide the lowest risk of developing an STI. The risk of pregnancy when using a male condom is about 14%, and when used correctly and consistently it is 3%; the risk of pregnancy if a female condom is used is 21%.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 23, Family Planning, Contraceptive Methods

**15. Answer: 1, 5, 6.**

**1** Oral agents have a hormonal component. **2** Diaphragms act as a barrier. **3** Cervical caps act as a barrier. **4** Female condoms act as a barrier. **5** Foam spermicides kill the sperm;

there is no hormonal effect. **6** Transdermal agents have a hormonal component.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 23, Contraceptive Methods, Data Base

**16. 1 Stress or infection can alter the body's metabolism, causing an elevation in temperature; a rise in temperature from these causes may be misinterpreted as ovulation.**

**2** This may increase sperm volume but does not affect the female's basal temperature. **3** Age is not a factor concerning efficiency of the basal body temperature method of contraception in premenopausal woman. **4** Frequency of intercourse may affect the volume of sperm but does not alter the female's basal temperature.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Contraceptive Methods, Data Base

**17. 1 Antiovulatory drugs suppress menstruation. Breakthrough bleeding is not expected with biphasic drugs. The drug is given for 21 days, and a menstrual flow does not occur during this time.**

**2** Sexual activity is not restricted when one is taking oral contraceptives. **3** There is no indication for increased Pap smears; once a year is sufficient. **4** Increasing calcium intake is not relevant to the administration of oral contraceptives.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Contraceptive Methods, Nursing Care

**18. 4 Excessive bleeding should be reported because it is an indication that all of the products of conception have not been evacuated.**

**1** The client may shower daily. **2** Tampons should be avoided for at least 3 days, although some protocols stress avoidance of tampons for 3 weeks. **3** Depending on the protocol, sexual intercourse should be avoided for at least 1 week and up to 2 weeks.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 23, Induced Abortion, Nursing Care

**19. 3 A follow-up visit 4 to 8 days later should confirm that the abortion has occurred.**

**1, 4** This is too soon. **2** This is too late.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23,

Induced Abortion, Data Base

**20. 3 A laparoscopic tubal ligation takes about 20 minutes to perform. The client is admitted as an outpatient and goes home the same day after she recovers from the anesthesia.**

**1** Menstruation will continue because there is no trauma to the ovaries or the endocrine glands involved with reproduction. **2** Sterility is immediate; a waiting period is not required as with a vasectomy. **4** Microsurgery to reverse the procedure is not guaranteed or easily accomplished.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Contraceptive Methods, Data Base

**21. 3 Ovulation occurs 14 days before the onset of menses.**

**1** Midway between cycles is appropriate only if the client has a 28-day cycle. **2** This means that ovulation occurs on approximately day 5 of the menstrual cycle, which is not factual. **4** Variations in the cycle occur in the preovulation period; it is not as accurate as counting 14 days before the next expected menses.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Menstrual Cycle

**22. 4 At this time, because of increased estrogen levels, the cervical mucus is abundant, and its quality changes in such a way as to optimize sperm survival time.**

**1** Cervical mucus at this time is no longer receptive to spermatozoa. **2** Cervical mucus is destructive to spermatozoa and sperm penetration at this time. **3** The cervical mucus at this time is not yet receptive to spermatozoa.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Menstrual Cycle

**23. 2 Past pelvic infections may result in tubal occlusions, most of which are caused by postinfection adhesions.**

**1** Although a tubal injury is possible, tubal infections are more common. **3** This is a benign tumor of the uterus and does not affect the tube. **4** Tubal congenital anomalies are rare; uterine anomalies are more common.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 23, Infertility and Sterility

**24. 1 A strategy for increasing the chances of conceiving requires the couple to plan intercourse only while the woman is ovulating; this removes spontaneity and is often stressful.**

**2** Obtaining and delivering the necessary specimens may be inconvenient but should not be stressful. **3** The number of office visits and examinations that are required may be cumbersome but should not be stressful. **4** Although taking daily temperatures may be annoying, it should not be stressful.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Infertility and Sterility

**25. 2 This is an accurate, objective statement that should be included in a discussion of genetic factors that influence fertility.**

**1** This is not the role of the nurse; based on the objective data imparted by the nurse, the couple should make the decision whether or not to be tested. **3, 4** This information is not relevant at this time and might cause unnecessary concern.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Infertility and Sterility

**26. 2 When the testes are twisted, a decrease in their blood supply occurs. This can result in gangrene.**

**1** Medication can be given to relieve pain. **3** The testes do not rupture if edema occurs. **4** Sperm are continually produced, so their destruction is not the concern.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Infertility and Sterility

**27. 4 This test enables the examiner to visualize the uterus and fallopian tubes and the pelvic organs of reproduction.**

**1** A biopsy is the surgical excision of tissue for diagnostic purposes. **2** A cystogram is used to visualize the urinary bladder. **3** A culdoscopy is the direct examination of female pelvic viscera using an endoscope introduced through a perforation in the vagina.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Infertility and Sterility

**28. 1 Providing factual information decreases fear and fosters further communication.**

**2** Cervical cancer is asymptomatic in the early stages. **3** This offers false reassurance. **4** At this time the client may not be able to focus on written instructions; also, the anxiety may be related to the potential implications of the results of the test rather than the actual procedure.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Related Procedures, Pelvic Examination

**29. 2 January 16. The time between ovulation and the next menstruation is relatively constant. Within a 30-day cycle the first 15 days are preovulatory, ovulation occurs on day 16, and the next 14 days are postovulatory.**

**1, 3, 4** This answer reflects an inaccurate calculation of the date of ovulation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 23, Menstrual Cycle

# Nursing Care Related to Major Disorders Affecting Women's Health

**30. 2 Leuprolide (Lupron) is administered once a month via IM injection; it decreases LH and FSH levels, as well as hormone-dependent tissue. One of its side effects is hot flashes.**

**1** Estrogen (Premarin) affects the release of pituitary gonadotropins and inhibits ovulation; it is contraindicated because the goal of treatment is to suppress the action of estrogen on the endometrial tissue. **3** Diclofenac (Voltaren) is used for primary dysmenorrhea; it is an NSAID that inhibits prostaglandin synthesis. **4** Ergonovine (Ergotrate) is used to contract the postpartum uterus.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Endometriosis, Data Base

**31. 1 Ceftriaxone (Rocephin) is a broad-spectrum antibiotic and is preferred during pregnancy.**

**2** Levofloxacin (Levaquin), although listed as an unlabeled use for gonococcal infection, should not be prescribed during pregnancy. **3** Sulfonamides may cause hemolysis in the fetus. **4** Trimethoprim/sulfamethoxazole (Bactrim) contains a sulfonamide and is contraindicated during pregnancy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Vaginitis, Data Base

**32. 2 Persistent pain of any kind during menstruation (dysmenorrhea) usually indicates a problem, and the client should seek medical attention.**

**1** Although diversion is a method to alter pain perception, the presence of pain requires investigation of possible causes. **3** Although a nutritious diet is beneficial, iron does not prevent the pain of dysmenorrhea. **4** Voluntary relaxation of the abdominal muscles does not result in cessation of dysmenorrhea.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Endometriosis, Data Base

**33. Answer: 3, 4.**

**1** This is not related to endometriosis. **2** This is not related to endometriosis. **3** Endometriosis is the presence of aberrant endometrial tissue outside the uterus. The tissue responds to ovarian stimulation and bleeds during menstruation, which causes rectal pressure. **4** Endometriosis is the presence of aberrant endometrial tissue outside the uterus. The tissue responds to ovarian stimulation and bleeds during menstruation, which causes abdominal pain. **5** This is not related to endometriosis. **6** Pelvic infections are not caused by endometriosis; they most frequently are sexually transmitted.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Endometriosis, Data Base

**34. 4 The nurse must determine the client's feelings concerning loss of fertility; if she is childless, the client must cope with the knowledge that unless ova are removed and frozen before the surgery, her genes will not be passed to the next generation, even with in vitro fertilization.**

**1** Laparoscopic surgery is relatively painless. **2** Since the abdominal cavity is not entered, there is minimal risk of hemorrhage. **3** There is no evidence to indicate that a chronic illness is related to the need for the surgery.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Endometriosis, Nursing Care

**35. Answer: 1, 3.**

**1** The posterior vaginal wall is pushed forward by the herniation of the rectum; this protrusion causes painful intercourse. **2** A rectocele is not accompanied by abdominal pain. **3** The posterior vaginal wall is pushed forward by the herniation of the rectum; this protrusion increases rectal pressure and causes the bearing-down sensation. **4** This is the primary sign of a cystocele. **5** A cystocele, not a rectocele, is associated with urinary tract infections.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Cystocele and/or Rectocele, Data Base

**36. 4 As the uterus drops, the vaginal wall relaxes. When the bladder herniates into the vagina (cystocele) and the rectal wall herniates into the vagina (rectocele), the individual feels pressure or pain in the lower back and/or pelvis. When there is an increase in intraabdominal pressure in the presence of a cystocele, incontinence results.**

**1** A white vaginal discharge (leukorrhea) and vaginal itching (pruritus) do not indicate cystocele and rectocele; they are common with a vaginal infection. **2** Sporadic bleeding is not expected with cystocele and rectocele. **3** These are not expected with cystocele and rectocele; a fever would indicate an infection; constipation, not diarrhea, is more likely to occur.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Cystocele and/or Rectocele, Data Base

**37. Answer: 1, 3, 4.**

**1** Distention causes discomfort; this is avoided because the catheter prevents retention. **2** Because the bladder is continually empty when an indwelling catheter is in place, it loses tone; this is an expected side effect. **3** The effects of anesthesia and the inflammatory process may impede voiding, leading to urinary retention; an indwelling catheter empties the bladder. **4** Distention places pressure on the suture line; this is avoided because the indwelling catheter prevents retention. **5** This is not necessary; hourly urine outputs reflect kidney function.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cystocele and/or Rectocele, Nursing Care

**38. 1 Immediately after this type of surgery, pain is associated with bearing down; the client should be instructed to increase fluid, fiber, and activity to prevent constipation.** **2** Exercise is encouraged. **3** The anterior colporrhaphy is expected to reduce incontinence;

urinary retention is not expected. **4** The colporrhaphy involves only the vaginal wall; the rectum should not be involved.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cystocele and/or Rectocele, Nursing Care

**39. 4 Ulcerations may occur when the vagina and uterus are displaced and exposed.**

**1** Edema is not usually the problem. **2** Fistulas are not associated with procidentia. **3** Exudate is not present with procidentia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Prolapsed Uterus, Nursing Care

**40. 3 Moist compresses may be ordered to prevent ulcerations.**

**1** Ambulation is contraindicated; it will predispose to the development of ulcerations. **2** This is ineffective because gravity alone does not correct the prolapse. **4** This may cause irritation and should be avoided.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Prolapsed Uterus, Nursing Care

**41. 2 The Fowler position facilitates localization of the infection by pooling exudate in the lower pelvis.**

**1, 3** This position does not use gravity to promote pooling of exudate in the lower pelvis. **4** This position does not use gravity to promote pelvic drainage despite an elevated head.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Pelvic Inflammatory Disease, Nursing Care

**42. 1 Erosion of the cervix frequently occurs at the columnosquamous junction, the most common site for carcinoma of the cervix.**

**2** Treatment of cervical erosions does not prevent pelvic inflammatory disease; early onset of sexual intercourse (before 16 years of age), multiple sexual partners, and history of human papillomavirus (HPV) infection are risk factors for cancer of the cervix rather than consequences of precervical cancer. **3** Metrorrhagia, abnormal bleeding from the uterus, may be present as erosion develops into carcinoma; however, spotting may be the earliest sign and will be eliminated when the cancer is treated. **4** The goal of treatment of the erosion is to prevent cancer.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cancer of the Cervix, Data Base

**43. 3 Polyps are usually benign, but a biopsy should be done because epidermoid cancer occasionally arises from cervical polyps.**

**1** Polyps usually are benign. **2** Polyps rarely are the precursors of uterine cancer. **4** Bleeding may occur whether they are benign or malignant.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Uterine Neoplasms, Data Base

**44. 4 Any sign of abnormal vaginal bleeding may indicate cervical cancer and must be investigated.**

**1** Discomfort is a late sign of cervical cancer because there are few nerve endings in this area. **2** The cancer must be extensive to cause pressure. **3** Discharge becomes foul-smelling after there is necrosis and infection; it is not an early sign.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Cancer of the Cervix, Data Base

**45. 1 According to the International Federation of Gynecology and Obstetrics, stage 0 is indicative of preinvasive cancer. When the cancerous cells are completely confined within the epithelium of the cervix without stromal invasion, it is stage 0 and called carcinoma in situ.**

**2** This is stage IA; there is minimal stromal invasion. **3** This is stage II and involves the area around the broad ligaments but not the pelvic wall; there is extension to the corpus of the uterus. **4** This is stage I.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 24, Cancer of the Cervix, Data Base

**46. 4 Rare cell adenoma of daughters is associated with mothers who took DES or DES-type drugs during pregnancy.**

**1** Although DES was prescribed between 1941 and 1971 to reduce the risk for spontaneous abortion in high-risk women, this question will not elicit specific information about DES. **2** Use of oral contraceptives is not associated with DES exposure. **3** The client with DES-related problems may exhibit abnormal bleeding or a heavy mucoid vaginal discharge, not lesions on the perineum.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

**Assessment/Analysis; Reference:** Ch 24, Cancer of the Cervix, Data Base

**47. 2 The physical trauma of the procedure will result in a blood-tinged vaginal discharge for several days.**

**1** Vaginal packing will be in place for 2 to 3 days; intercourse and tampon use should be delayed until total healing occurs. **3** Conization does not involve an external incision or dressing. **4** Conization affects only the cervix and does not alter reproductive ability.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 24, Cancer of the Cervix, Nursing Care

**48. 3 Aprons do not protect the posterior side of the caregiver; therefore, the nurse should always keep the front of the apron facing the source of radiation.**

**1** This is unnecessary. Body fluids of clients with unsealed, not sealed, implants may be contained in a specially marked container, while others are allowed to use a toilet followed by several flushes. **2** Client receiving radioactive sealed or unsealed therapy should be in a private room with a private bath. This protects other clients receiving internal radiation from excessive exposure. **4** Visiting should be limited to those individuals who are 16 years of age and older. Visits should last no longer than 30

minutes daily. Visitors should be taught to maintain a 6-foot distance from the source of the radiation.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cancer of the Cervix, Nursing Care

**49. 1 An panhysterectomy in the premenopausal woman produces artificial onset of menopause.**

**2, 3, 4** Because the uterus is removed, there will be no uterine endometrial proliferation and no desquamation.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Uterine Neoplasms, Data Base

**50. 4 A hysterectomy involves only removal of the uterus. The ovaries, which secrete estrogen and progesterone, are not removed. Therefore, menopause will not be precipitated but will occur naturally.**

**1** Surgical menopause is precipitated by the removal of the ovaries, not the uterus. **2** When the ovaries are removed, older women might have less severe symptoms than younger women; however, in this instance the ovaries are not removed. **3** This does not answer the question. The nurse should serve as a resource person.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Uterine Neoplasms, Data Base

**51. 4 The nurse cannot prescribe medication. In addition, the use of hormones is controversial and depends on the health care provider's beliefs and the client's needs.**

**1, 3** This is advice the nurse is not legally licensed to provide. **2** This is an evasive response; it does not answer the client's question.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Uterine Neoplasms, Data Base

**52. 1 During an abdominal hysterectomy the urinary bladder may be nicked accidentally.**

**2** The client is not likely to develop an infection with bleeding so soon. **3** Bleeding would be present from other sites, such as the incision, as well as in the urinary bag. **4** The uterus is removed with a hysterectomy; therefore, there is no uterine bleeding.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 24, Uterine Neoplasms, Nursing Care

**53. 4 Estrogen receptor protein (ERP)-positive tumors have a more dramatic response to hormonal therapies that reduce estrogen.**

**1** Estrogen contributes to tumor growth; supplements are not indicated. **2** This does not influence breast reconstruction. **3** ERP-positive is unrelated to metastasis.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cancer of the Breast, Data Base

- 54. 3 Postoperatively the arm on the operated side is elevated on pillows, with the hand higher than the arm to prevent muscle strain and edema.**  
**1** Total immobilization should be avoided, and adduction may put undue pressure on the operative site. **2** Although the arm is slightly abducted, sandbags are not used because complete immobility should be prevented. **4** This will impair venous return and increase edema.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cancer of the Breast, Nursing Care
- 55. 1 Deep breathing aids in expanding lung tissue and prevents stasis of pulmonary secretions.**  
**2** Although empathetic, delay could compromise the client's respiratory status. **3** This may result in atelectasis and retained respiratory secretions. **4** This only states a fact and provides no option to meet the need to limit pain or the need to prevent atelectasis.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Caring; Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Cancer of the Breast, Nursing Care
- 56. 4 This defect in bone matrix formation weakens the bones, making them unable to withstand usual functional stresses.**  
**1** Avascular necrosis is death of bone tissue that results from reduced circulation to bone. **2** Pathologic fractures can result from osteoporosis. **3** Hyperplasia of osteoblasts is not related to osteoporosis. This occurs during bone healing.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Osteoporosis, Data Base
- 57. 1 This regimen limits bone demineralization and reduces bone pain, which promote increased activity.**  
**2** This is unrelated to osteoporosis; it would be an expected outcome if the client were receiving calcium for hypocalcemia. **3** This is unrelated to osteoporosis or its therapy. **4** This is unrelated to osteoporosis; it would be expected if the client were receiving vitamin C for capillary fragility.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 24, Osteoporosis, Nursing Care
- 58. 3 Prolonged immobility results in bone demineralization because there is decreased bone production by osteoblasts and increased resorption by osteoclasts.**  
**1** Estrogen helps prevent bone demineralization. **2** Hypoparathyroidism decreases mobilization of calcium from the bones, and thus serum calcium level is lowered. **4** Decreased calcium intake or absorption may precipitate osteoporosis.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 24, Osteoporosis, Data Base
- 59. 3 Turnip greens are high in calcium and vitamins.**  
**1** High levels of nitrogen from protein breakdown may increase the release of calcium

from bone to serve as a buffer of the nitrogen. **2** Soft drinks that are high in phosphorus may interfere with calcium absorption from the gastrointestinal (GI) tract. **4** Enriched grains that are high in phosphorus may interfere with calcium absorption from the GI tract.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 24, Osteoporosis, Nursing Care

**60. 3 A diet high in calcium and exercise, which helps deposit calcium into bone, are the most important factors in limiting the extent of osteoporosis.**

**1** Weight gain should be discouraged to limit stress on the client's bones. **2** Increased, not decreased, urine calcium should be monitored because it reflects demineralization of bone. **4** Opioids usually are not prescribed; other analgesics are used for pain.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Osteoporosis, Nursing Care

**61. Answer: 3, 5.**

**1** Weight loss should be slow and reasonable; restricting calories promotes production of the hormone leptin, which stimulates bone loss. **2** Eight hundred or more (up to 2,000), international units (IU), not 400 IU, of vitamin D are the recommended daily intake for a postmenopausal woman. **3** This is the recommended daily intake of calcium for a postmenopausal woman. **4** These activities may promote overall health and vigor; they will not increase the strength or mass of bone. **5** Weight-bearing activities (e.g., walking, dancing, weight lifting, and aerobic exercise) are best for building bone mass.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 24, Osteoporosis, Nursing Care

**62. 4 Teriparatide (Forteo) is a 34–amino acid polypeptide that represents the biologically active part of human parathyroid hormone; it enhances bone microarchitecture and increases bone mass and strength.**

**1** Supplemental intake of vitamin A should not exceed recommended daily requirements; too much vitamin A has been associated with bone loss and an elevated rate of fractures. **2** Alendronate sodium (Fosamax), a regulator of bone metabolism, not teriparatide (Forteo), inhibits osteoclast-mediated bone resorption, minimizing loss of bone density. **3** Sunscreen should be avoided to promote exposure to the sun so that vitamin D can be converted in the skin; vitamin D helps the body absorb calcium. Sunscreen should be used after 5 to 20 minutes of exposure to prevent the negative effects of prolonged exposure to ultraviolet rays.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Osteoporosis, Data Base

**63. 3 Although not 100% effective, a condom is the best protection against gonorrhea in a sexually active person.**

**1** Douching has no proven protective effect against sexually transmitted infections;

excessive douching can alter the natural environment of the vagina and may even promote an ascending infection. **2** Although this is the best way to prevent a sexually transmitted infection, it is not the most realistic response for a sexually active person. Once people become sexually active, they usually remain sexually active. **4** Spermicidal creams do not have a protective effect against sexually transmitted infections; spermicides kill sperm and limit the risk for pregnancy.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 24, Vaginitis, Nursing Care

**64. 4 Metronidazole (Flagyl) is a potent amebicide. It is effective in eradicating the protozoan *Trichomonas vaginalis*.**

**1** Penicillin is administered for its effect on bacterial, not protozoal, infections. **2** Gentian violet is a local antiinfective that is applied topically; it may cause discoloration of the skin. Gentian violet is effective against *Candida albicans*. **3** This is an antifungal for infections caused by *C. albicans*.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:**

Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 24, Vaginitis, Data Base

**65. 3 This is the anatomic direction of the vaginal tract in the back-lying position.**

**1, 2, 4** The vaginal tract may be injured when the douche nozzle is directed without considering the vagina's anatomy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 24, Vaginitis, Nursing Care

# **Nursing Care of Women during Uncomplicated Pregnancy, Labor, Childbirth, and the Postpartum Period**

**66. 2 Expected periods of marked change and adjustment are called developmental crises.**

**1** These are transient; they are similar to previous mood changes and should not affect the client's ability to cope. **3** These occur throughout the life cycle of a mature woman and should not now be classified as a crisis. **4** Pregnancy becomes a crisis if the client's partner withdraws support.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**67. 3 Nonsteroidal antiinflammatory drugs (NSAIDs), as well as other over-the-counter (OCT) drugs taken during pregnancy, may cause problems in the newborn during the neonatal period.**

**1** This is not a cause for concern; if the membranes ruptured more than 24 hours before birth, infection may be a concern. **2** Hemophilia affects males; this fetus is known to be a female. A female may be a carrier but will not have hemophilia. **4** A history of a placenta previa in an earlier pregnancy will not have implications for this newborn.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**68. 4 This is a genetic disorder transmitted as an autosomal recessive trait that occurs primarily among Ashkenazi Jews.**

**1, 2, 3** This disease does not have a higher prevalence in the Jewish population.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**69. 1 During the eighth week of pregnancy the organ systems and other structures are developed to the extent that they take the human form; at this time the embryo becomes a fetus and remains so until birth.**

**2** At this time the developing cells are called an embryo. **3** At the time of implantation the group of developing cells is called a blastocyst. **4** The embryo can be visualized on a sonogram before it becomes a fetus.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period, Development of the Embryo/Fetus

**70. 2 The pressure of the enlarging fetus causes upward displacement of the diaphragm, which results in thoracic breathing; this limits the descent of the diaphragm on inspiration.**

- 1** The lower rib cage expands. **3** There is no change in the size of the lung during pregnancy. **4** The thoracic cage enlarges; it does not rise.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy
- 71. 3 By this time the fetus and placenta have grown, expanding the size of the uterus. The enlarged uterus extends into the abdominal cavity.**  
**1, 2** At this time the uterus is still within the pelvic area. **4** At this time the uterus has already risen out of the pelvis and is extending farther into the abdominal area.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy
- 72. Answer: 2, 5, 4, 1, 3.**
- 2** Sickle cell screening, particularly for black women, should be done on the initial visit. **5** Alpha-fetoprotein (AFP) testing for neural tube defects should be done between 14 and 16 weeks. **4** Serum glucose testing for gestational diabetes should be done between 26 and 28 weeks. **1** Fetal movement tests can begin at 28 weeks gestation because the fetus' pattern of movement becomes stabilized at this time. **3** Group B streptococcus culture should be done between 36 and 38 weeks.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy
- 73. Answer: 1, 2, 5.**
- 1** Understanding risks of transmission along with treatment options if the client is HIV positive will help her make appropriate decisions regarding testing. **2** Some women are confused about what positive or negative means when receiving test results. Explaining this in pretest counseling and again when results are given decreases unnecessary stress and misunderstanding. **3** Although it may be helpful for health care providers to know if a client is at risk for HIV, the client is not required to disclose this information. **4** HIV testing of pregnant women is not required; however, it is recommended by health care providers. **5** Because of the stigma of the disease and possible effects on insurance and medical care, clients should receive adequate counseling regarding implications.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy
- 74. 1 This is the period in which the fetus stores deposits of fat.**  
**2** There is growth, but fat deposition does not occur in this period. **3** The first 8 weeks is the period of organogenesis, when cells differentiate into major organ systems. **4** This is the period of the blastocyst, when initial cell division takes place.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period, Development of the Embryo/Fetus

**75. 2 April 29, 2011. The Nägele rule is an indirect, noninvasive method for estimating the date of birth: EDB = last menstrual period + 1 year – 3 months + 7 days.**

**1** This is beyond the expected date of birth. **3, 4** This is before the expected date of birth.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**76. 4 Increasing the client's knowledge of physical and psychologic changes resulting from pregnancy prepares the client for expected changes as pregnancy continues; it is most effective when taught during the first trimester.**

**1** This is too early; this should be done in the last trimester. **2** The client should be alerted to danger signs and symptoms; however, primary teaching is directed toward increasing her knowledge of expected physiologic changes. **3** Concerns about role transition to parenthood should be addressed in the third trimester.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**77. 2 Crown to rump measurement is used to determine the age of the embryo until 11 weeks.**

**1** Occipital frontal diameter is not an ultrasound measurement used at term. **3** Biparietal diameter at term will be approximately 9.8 cm. **4** Diagonal conjugate is not used as an ultrasound measurement; it is the estimated size of the maternal pelvic outlet. The actual size of the pelvis, as it relates to fetal size, is best determined with ultrasonography.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**78. 2 The blood volume increases by approximately 50% during pregnancy. Peak blood volume occurs between 30 and 34 weeks' gestation.**

**1** The hematocrit decreases as a result of hemodilution. **3** The sedimentation rate increases because of a decrease in plasma proteins. **4** WBC values remain stable during the antepartum period.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**79. 3 A purplish color results from the increased vascularity and blood vessel engorgement of the vagina.**

**1** This is softening of the lower uterine segment. **2** This is softening of the cervix. **4** After the fourth month of pregnancy, uterine contractions can be felt through the abdominal wall. They are irregular and painless, and they increase blood flow to the placenta.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**80. 2 There is a 30% to 50% increase in maternal plasma volume at the end of the first trimester, leading to a decrease in the concentrations of hemoglobin and erythrocytes.**

**1** Erythropoiesis increases after the first trimester. **3** Iron utilization is unrelated to the development of physiologic anemia of pregnancy. **4** Detoxification demands are unchanged during pregnancy.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**81. 2 The hemoglobin level of a healthy individual is 12 to 16 g/dL. During pregnancy it may decrease as a result of an increased blood volume, especially during the second trimester. The hemodilution is greater than a concomitant increase in RBC production, causing physiologic anemia. If the hemoglobin decreases to less than 11 g/dL, the client is diagnosed with anemia, probably due to a deficiency of iron or folic acid. Iron supplementation may need to be increased.**

**1** The expected platelet level is 150,000 to 400,000  $\text{mm}^3$ . There should be no significant change in this level throughout pregnancy. **3** The expected fasting blood glucose is 70 to 105 mg/dL; there should be no significant change in this level throughout pregnancy. **4** The expected WBC count is 5,000 to 10,000  $\text{mm}^3$  and during pregnancy it is 5,000 to 15,000  $\text{mm}^3$ ; it begins to rise in the second trimester and peaks in the third trimester.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**82. 3 Before health teaching is instituted, the nurse should ascertain the client's past experiences; they will influence the teaching plan.**

**1** This does not give the client a chance to discuss her feelings about the examination. **2** This presupposes that the client is fearful and does not address the client's question. **4** This does not give the client a chance to discuss her feelings about the examination; the nurse is assuming that the client's concerns are related to discomfort.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**83. 3 The acronym GTPAL reflects G, gravidity; T, term birth; P, preterm births; A, abortions; and L, living children; G5 T2 P1 A1 L4 indicates that there were 5 pregnancies, twins count as 1 pregnancy and the present pregnancy counts as 1; 2 term births; twins count as 1 preterm birth; 1 abortion; 4 living children.**

**1** G4 T3 P2 A1 L4: this indicates that there were 4, not 5, pregnancies; 3, not 2, term

births; twins count as 1, not 2, preterm birth; 1 abortion; 4 living children. **2 G5 T2 P2 A1 L4:** this indicates that there were 5 pregnancies; 2 term births; twins count as 1, not 2, preterm birth; 1 abortion; 4 living children. **4 G4 T3 P1 A1 L4:** this indicates that there were 4, not 5, pregnancies; 3, not 2, term births; twins count as 1 preterm birth; 1 abortion; 4 living children.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**84. 4 This is an expected cardiopulmonary adaptation during pregnancy caused by an increased ventricular rate and elevated diaphragm.**

**1, 2, 3** This is pathologic, a sign of impending cardiac decompensation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**85. 4 Chorionic gonadotropin, secreted in large amounts by the placenta during gestation, and the metabolic changes associated with pregnancy can precipitate nausea and vomiting in early pregnancy; usually the manifestations of morning sickness disappear after the first trimester.**

**1** Estrogen is elevated throughout pregnancy, but it is not the instigator of the nausea and vomiting. **2** Progesterone is elevated throughout pregnancy, but it is not the instigator of the nausea and vomiting. **3** The luteinizing hormone is present only during ovulation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**86. 2 Sodium is needed to maintain body water balance; sodium requirements increase slightly during pregnancy to accommodate the increased blood volume. A healthy pregnant woman should not limit her sodium intake.**

**1** This could be detrimental to the client's health. **3** Sodium, although essential, is not a nutrient but a mineral. **4** There are no restrictions on salt intake during pregnancy.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**87. 1 Maintaining the sitting position for prolonged periods may constrict the vessels of the legs, particularly in the popliteal spaces, as well as diminish venous return. Walking contracts the leg muscles and applies gentle pressure to the veins, thus promoting venous return.**

**2** A better means of improving circulation is to walk around several times each morning and afternoon; the legs can be elevated while sitting at her desk. **3** If the client is feeling well, there are no contraindications to working throughout her pregnancy. **4** Adequate nourishment can be obtained during mealtimes; the client does

not require extra nutrition breaks.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

88. **1 More information is needed before the nurse can give a professional response.**

**2** Although the client's feelings are important, at this time she is seeking information. **3** Although this is true, more information is needed before the nurse should respond. **4** This is misinformation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

89. **2 The nurse should become informed about the cultural eating patterns of clients so that foods containing the essential nutrients that are part of these dietary patterns will be included in the diet.**

**1** Fluid retention is only one component of weight gain; growth of the fetus, placenta, breasts, and uterus also contributes to weight gain. **3** Calories and nutrients are increased during pregnancy. **4** Pregnancy diets are not specific; they are composed of the essential nutrients.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

90. **2 Asking what she usually eats enables the nurse to assess the woman's level of nutritional knowledge and gain clues for appropriate methods of counseling.**

**1** A "regular" diet does not indicate that the client is eating a nutritious diet; also, the client will need increased protein and calories. **3** These foods may be too expensive and different from her usual choices, leading to nonadherence to a healthy diet. **4** If the client's diet includes highly seasoned foods and they are well tolerated, they need not be excluded.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

91. **Answer: 4, 5.**

**1** Beef and fish do not contain an adequate amount of folate. **2** Milk and cheese do not contain an adequate amount of folate. **3** Fowl does not contain an adequate amount of folate. **4** Legumes contain large amounts of folate. **5** Enriched grain products contain large amounts of folate.

**Client Need:** Health promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

92. **2 The uterus and bladder occupy the pelvic cavity and lie closely together; as the uterus enlarges with the growing fetus, it impinges on the space occupied by the**

**bladder and thereby diminishes bladder capacity.**

**1** Atony does not cause frequency; more likely, it may lead to retention. **3** This will lead to incontinence rather than frequency. **4** This is an unlikely occurrence; the uterus does not impinge on this area.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**93. Answer: 1, 3, 4.**

**1** During pregnancy, batterers may concentrate their anger at the pregnancy itself and focus their assaults on the breasts, buttocks, and abdomen. **2** Control is a primary concern of the abuser, so it would be highly unlikely for him to leave the client alone with the care provider. **3** It is common for the abuser to control the conversation by answering for the client. **4** Women who are battered are at risk for stress illnesses such as GI distress and chest pain. They are more likely to suffer from frequent headaches and depression. **5** This is not typical behavior of an abusive person.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**94. 2 A rubella titer of 1 : 2 is inadequate immunization. A titer of 1 : 8 is considered immune. Rubella immunization protects the fetuses of future pregnancies from significant birth defects caused by a rubella infection. These laboratory results are borderline for pregnancy but were taken during the prenatal period and do not represent the woman's current status.**

**1** There is no evidence that the neonate needs a transfusion. **3** A RhoGAM injection is not needed because the infant also is Rh negative. **4** This is an expected glucose level for a neonate.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**95. 1 Nausea and vomiting in the morning occur in almost 50% of all pregnancies. Eating dry crackers before getting out of bed in the morning is a simple remedy that may provide relief.**

**2** Increasing fat intake does not relieve the nausea. **3** This is not helpful; separating fluids from solids at mealtime is more advisable. **4** Eating two small meals a day and a snack at noon does not meet the nutritional needs of a pregnant woman, nor will it relieve nausea. Some women find that eating five or six small meals daily instead of three large ones is helpful.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**96. 1 Nausea and vomiting in early pregnancy can be relieved with a small snack of**

**protein before bedtime to slow digestion.**

**2** An antacid may affect electrolyte balance; also this will not help morning sickness. **3** This is contraindicated, because both fetus and mother need nourishment. **4** Medications in the first trimester are contraindicated because this is the period of organogenesis, and congenital anomalies could result.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**97. 3 This is the recommended caloric increase for adult women to meet the increased metabolic demands of pregnancy.**

**1, 2** This will not meet the metabolic demands of pregnancy and may harm the fetus. **4** This is the recommended caloric increase for breastfeeding mothers.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Knowledge; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**98. 1 The average weight gain during pregnancy is 25 to 35 lb (11.3 to 15.8 kg); of this, the fetus accounts for 7 to 8 lb (3.2 to 3.6 kg), or approximately 30% of weight gain.**

**2** Fluid retention accounts for about 20% to 25% of weight gain. **3** Metabolic alterations do not cause a weight gain. **4** Increased blood volume accounts for about 12% to 16% of weight gain.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**99. 2 Because of a decrease in chorionic gonadotropin, morning sickness seldom persists beyond the first trimester.**

**1, 3** Morning sickness usually ends at the end of the third month, when the chorionic gonadotropin level falls. **4** Morning sickness is still present at this time; it is related to the high level of chorionic gonadotropin.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**100. 2 This allows the client to discuss her feelings and participate in her care.**

**1** This is not relevant at this time; the client needs help with the alterations that occur in early pregnancy. **3** This cuts off communication and does not address the client's concerns. **4** This cuts off communication; also it may cause the client to worry that something is seriously wrong.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:**

Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**101. 1 When an Rh-negative woman carries an Rh-positive fetus, there is a risk for maternal antibodies against Rh-positive blood; antibodies cross the placenta and destroy the fetal RBCs.**

**2** Determination of the lecithin/sphingomyelin ratio or the phosphatidylglycerol test, not the Rh factor, may provide information about the risk for developing respiratory distress syndrome (RDS). **3** Testing for the Rh factor will not provide information about protein metabolism deficiency. **4** Physiologic bilirubinemia is a common occurrence in newborns; it is not associated with the Rh factor.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**102. 2 The first trimester is the period when all major embryonic organs are forming; drugs, alcohol, and tobacco may cause major defects.**

**1** Cutting down on these substances is insufficient; they are teratogens and should be eliminated. **3** Even 1 ounce of an alcoholic drink is considered harmful; baby aspirin may be prescribed to some women who are considered at risk for pregnancy-induced hypertension, but not during the first trimester. **4** Medications, unless absolutely necessary, should be avoided throughout pregnancy, but the first trimester is most significant.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**103. 1 With spontaneous or stimulated activity, the fetal heart rate (FHR) is usually between 110 and 160 beats/min. This is to be expected, and the client should be made aware of this.**

**2** The heart rate for a fetus is 110 to 160 beats/min, not twice the mother's heart rate. **3** This implies that the heart rate is too rapid; this is misinformation that may cause more concerns. **4** The heart rate is rapid to accommodate the metabolic, not nutritional, needs of the fetus.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period, Development of the Embryo/Fetus

**104. 2 Increased estrogen production during pregnancy causes hyperplasia of the vaginal mucosa, which leads to increased production of mucus by the endocervical glands. The mucus contains exfoliated epithelial cells.**

**1** Increased metabolism leads to systemic changes but does not increase vaginal discharge. **3** The amount of secretion from the Bartholin glands, which lubricates the vagina during intercourse, remains unchanged during pregnancy. **4** There is no additional supply of sodium chloride to the vaginal cells during pregnancy.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes

During Pregnancy

**105. 3 Dependent edema is common during the last trimester; there is no need to lower the salt content of the client's diet. Teaching should be based on optimum nutrition as well as the caloric content of the diet.**

**1** Not all preferences can be included; the diet should contain normal sodium, high protein, and sufficient calories. **2** Immediate planning based on the nurse's knowledge of dietary needs is sufficient **4** Unless the nurse thought there was a need for medical intervention, the nurse may discuss care related to human responses.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**106. 3 Elevation of the extremities several times daily is recommended to decrease the dependent edema.**

**1** Fluid intake should be encouraged because adequate hydration maintains fluid and electrolyte balance. **2** Sodium intake should not be restricted because it is needed to balance the increased fluid volume during pregnancy. **4** Diuretics can be harmful and are not used during a healthy pregnancy.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**107. 3 The alpha-fetoprotein test can detect not only neural tube defects, but Down syndrome, and other congenital anomalies. It is a screening test that affords a tentative diagnosis; confirmation requires more definitive testing.**

**1, 2, 4** These are not detected by the alpha-fetoprotein test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**108. 4 The nonstress test evaluates the response of the fetus to movement and activity. A reactive test indicates that the fetus is healthy.**

**1** No injections of any kind are used during a nonstress test; this test involves only the use of a fetal monitor to record the fetal heart rate during periods of activity. **2** This test will not influence the activity of the fetus because no exogenous stimulus is used. **3** This is unlikely because it is a noninvasive test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**109. 3 A full bladder is required for effective visualization of the uterus in early pregnancy.**

**1** The GI tract is not involved; this is a noninvasive procedure. **2** The procedure is not done via the colon and will not cause fecal contamination. **4** This procedure is

noninvasive; it cannot irritate the uterus and initiate labor.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**110. 3 When the membranes rupture, the potential for infection is increased, and when the contractions are 5 to 8 minutes apart, they are usually of sufficient force to warrant professional supervision.**

**1** These may be early signs of labor or signs of posterior fetal position; it is too early to notify the health care provider. **2, 4** This is too early; the client should remain with her family and keep moving around at home.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**111. 2 The supine position results in pressure on the vena cava by the gravid uterus; this impedes venous return, causing hypotension and decreased systemic perfusion.**

**1** This may or may not happen. **3** Even if this occurs, it is not the reason for discouraging the supine position. **4** It can lead to hypotension, not hypertension.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**112. 4 Alpha-fetoprotein in amniotic fluid is elevated in the presence of a neural tube defect.**

**1** Lung maturity cannot be determined until after 35 weeks' gestation. **2** Diabetes cannot be detected via an amniocentesis. **3** Cardiac disorders cannot be detected via an amniocentesis.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**113. 2 The leg cramps may be related to low calcium intake; cheese and broccoli both have a high calcium content.**

**1, 3, 4** Although these foods are recommended to maintain quality nutritional intake, they are inadequate sources of calcium.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**114. 3 The greatest danger of drug-induced malformations is in the first trimester of pregnancy during the period of organogenesis; because a woman may not know she is pregnant, she should be aware of this before becoming pregnant.**

**1** Although adolescent girls may be aware of this, it is not a priority concern at this age. **2** Drugs should be avoided throughout pregnancy, but the first trimester (period of organogenesis) is the most critical. **4** If the client is not aware of her pregnancy, it

may be too late to start discontinuing drugs.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 25, Prenatal Period, Development of the Embryo/Fetus

**115. 2 Cigarette smoking or continued exposure to secondary smoke causes both maternal and fetal vasoconstriction, resulting in fetal growth retardation and increased fetal and infant mortality.**

**1** There is no clinical evidence that smoking relieves tension or that the fetus is more relaxed. **3** Smoking causes vasoconstriction; permeability of the placenta to smoke is irrelevant. **4** Although the fetal and maternal circulations are separate, vasoconstriction occurs in both mother and fetus.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**116. 3 High levels of chorionic gonadotropin frequently are associated with severe vomiting during pregnancy and may result in hyperemesis gravidarum. These high levels also occur if there is a hydatidiform mole or a multiple pregnancy.**

**1** Cholecystitis is unrelated to this problem. **2** Hydramnios (excessive amniotic fluid) is associated with a multiple gestation and some fetal abnormalities. **4** There are no data to indicate that there is decreased gastric acid secretion during the first trimester; this is not the cause of hyperemesis gravidarum.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 25, Prenatal Period, Nursing Care During the Prenatal Period

**117. Answer: 2, 4, 5.**

**1** Systemic vasodilation is not expected. **2** Blood volume is increased to meet the metabolic demands of pregnancy. **3** There is little variation in blood pressure with a slight decrease during the second trimester. **4** An increased cardiac output is necessary to accommodate the increased blood volume needed to meet the demands of the growing fetus. **5** Cardiac hypertrophy is a result of the demands made by the increased blood volume and cardiac output. **6** Erythrocyte production increases; because the plasma volume increases more than the RBCs, the hematocrit is lower.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes During Pregnancy

**118. 2 Both the father and the mother need additional support during the transition phase of the first stage of labor.**

**1** This statement is judgmental; it suggests that the father will be failing his wife. **3** The husband should be present throughout labor to support his wife; he should be assisted in this role. **4** This does not encourage the husband to fulfill his role of supporting his wife during labor.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**119. 1 Epidural anesthesia during the first stage of labor decreases metabolic and respiratory demands and is preferred for obese clients.**

**2, 4** Obese women are sensitive to systemic opioids, which predispose them to respiratory depression; oral medications do not have a uniform rate of absorption and are not recommended during labor. **3** A pudendal block does not reach the uterus, so contractions are felt; it is used during the second stage of labor.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**120. 1 Maternal hypotension is a common complication of this anesthesia during labor, and nausea is one of the first clues that this has occurred. Turning the client onto her side will deflect the uterus from putting pressure on the inferior vena cava, which causes a decrease in blood flow.**

**2** If signs and symptoms do not abate after turning on the side, the health care provider should be notified. **3** This is not a specific observation after epidural anesthesia; it is part of the general nursing care during labor. **4** If the FHR is being monitored, it is a constant process and should be recorded every 15 minutes; if not, the FHR should be checked and recorded every 15 minutes.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**121. 1 Respiratory depression may occur in the newborn because the duration of action of Butorphanol (Stadol) is 3 to 4 hours and circulating blood levels will be high if birth occurs within that time.**

**2, 3, 4** These are antihistamines that have a sedative effect and are administered early in labor to promote sleep and decrease anxiety.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Intrapartum Period, Data Base

**122. 4 Nalbuphine (Nubain) is classified as an opioid analgesic and is effective for the relief of pain; there is little or no newborn respiratory depression.**

**1** Nalbuphine does not induce amnesia. **2** Nalbuphine acts as an analgesic, not an anesthetic. **3** Nalbuphine does not induce sleep.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**123. 2 Ambulation relieves the discomfort of preparatory (Braxton Hicks) contractions.**

**1** These contractions will increase when the client is resting. **3** These contractions are not indicative of true labor and need not be timed. **4** Aspirin may be harmful to the fetus because it can hemolyze RBCs.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**124. 1 Progressive cervical dilation is the most accurate indication of true labor.**

**2** With true labor, contractions will increase with activity. **3** Contractions of true labor persist in any position. **4** Contractions may not begin until 24 to 48 hours later.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**125. 2 Fatigue will influence other coping strategies, such as distraction.**

**1** The progesterone level is decreased at this time. **3** The client does not push during the first stage of labor; pushing is done during the second stage. **4** This may decrease the quality of the contractions.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**126. 1 Determining fetal well-being takes priority over all other measures. If the FHR is absent or persistently decelerating, immediate intervention is required.**

**2, 3, 4** Although this is important, the determination of fetal well-being is the priority.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**127. 2 A station of +1 indicates that the fetal head is 1 cm below the ischial spines.**

**1** The head is now past the points of engagement, which are the ischial spines. **3** This is designated as 0 station. **4** The head must be at +3 to +4 station to be visible at the vaginal opening.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**128. 3 Fetal heart tones are best auscultated through the fetal back; because the presenting part is in the right occiput posterior (ROP) position, the back is below the umbilicus and on the right side.**

**1** This location should be used when the fetus is lying in the midline in a breech position. **2** This location is appropriate when the fetus is in the left sacrum anterior (LSA) position. **4** This location is appropriate when the fetus is in the left occiput anterior (LOA) or left occiput posterior (LOP) position.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**129. 3 The contractions become stronger, last longer, and are erratic during this stage; the intervals between contractions become shorter than the contractions themselves; the client needs to apply much concentration and effort to pace her breathing with each contraction.**

**1** Even clients who have been adequately prepared will experience these behaviors during

the transition phase of the first stage of labor. **2** Administration of an analgesic at this time may reduce the effectiveness of labor and depress the fetus. **4** There is no indication that the contractions are hypertonic.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**130. 4 This is the accepted way to determine the frequency of the contractions.**

**1** This does not determine the length of a contraction. **2** This does not indicate the frequency of contractions. **3** This identifies the end of a contraction, but it is not the accepted way of timing the frequency of contractions.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**131. 2 By 36 weeks' gestation, amniotic fluid should be pale yellow with small particles of vernix caseosa present.**

**1** Dark amber-colored fluid suggests the presence of bilirubin, an ominous sign. **3** Greenish yellow fluid may indicate the presence of meconium and suggests fetal compromise. **4** Cloudy fluid suggests the presence of purulent material, and greenish yellow may indicate the presence of meconium.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**132. 3 Electronic fetal monitoring provides a continuous graphic printout of rate patterns and periodic changes; on this FHR strip the baseline heart rate is 150 beats/min.**

**1** Contractions are not sustained; there is uterine relaxation between contractions. **2** FHR variability is minimal, not marked. **4** Contractions are lasting 100 seconds.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**133. 1 Because the client is attached to a machine and movement may alter the tracings, movement is discouraged.**

**2** Placement of the external monitor leads does not interfere with the administration of sedatives. **3** An external monitor does not interfere with breathing techniques. **4** An external monitor does not necessitate more frequent vaginal examinations.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**134. 1 Variable decelerations usually are seen as a result of cord compression; a change of position will relieve the pressure on the cord.**

**2** Variable decelerations are not related to the mother's blood pressure. **3** Variable decelerations are not oxytocin related. **4** This is premature; other nursing measures should be tried first.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

135. **Answer:** 2, 1, 3, 4, 5.

2 Repositioning to the side increases uterine blood flow, improves cardiac output, and moves pressure of the uterus off of the vena cava. 1 Increasing IV fluids augments uterine blood flow and improves cardiac output. 3 Reassessing the FHR pattern enables the nurse to determine if the FHR has returned to a safe level without reflex late decelerations. 4 Persistent late decelerations is a nonreassuring fetal sign; the health care provider should be informed. 5 Documentation of interventions and client responses includes the information in the client's legal clinical record and provides communication to other care providers.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

136. **1 When the membranes rupture, there is always the possibility of a prolapsed cord leading to fetal compromise, which will manifest itself in a slow FHR.**

2 This is regularly done before and after the membranes rupture; however, fetal status takes priority. 3 This is unnecessary unless there is a marked change in the FHR. 4 This is done routinely throughout the labor process; at this time fetal status takes priority.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care during the Intrapartum Period

137. **3 The client is in the first stage of labor; she and the fetus were assessed earlier and both are stable. At this time the priority of care is to establish a trusting relationship with her and her partner. This will help to allay their anxiety.**

1 This may be necessary later; however, it is not the priority. 2 The history should be taken from the client as long as she is capable of providing it. 4 This is not a priority; the health care provider may have been notified already.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

138. **3 The priority is to assess for a prolapsed umbilical cord. This is a life-threatening emergency for the fetus and must be ruled out first.**

1 This is done after verifying that the umbilical cord is not visible in the vaginal introitus. 2, 4 This is not the priority; this can be done after confirming fetal well-being.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

139. **4 Artificial rupture of the membranes (amniotomy) allows for more effective pressure of the fetal head on the cervix, enhancing dilation and effacement.**

1 Vaginal bleeding may increase because of the progression of labor. 2 An amniotomy does not directly affect the fetal heart rate. 3 Discomfort may become greater because

contractions usually increase after an amniotomy.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Intrapartum Period, Data Base

**140. 3 The client is experiencing the expected discomforts of labor; the nurse should initiate measures that will promote relaxation.**

**1** The client is in early first-stage labor; pushing commences during the second stage. **2** This breathing technique should be used in the transition phase, not the early phase of the first stage of labor. **4** There is no evidence that the client's bleeding is excessive.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**141. Answer: 2, 1, 6, 3, 4, 5.**

**2** The nurse should first stop the oxytocin infusion when tetanic contractions occur; this should relax the uterus and prevent uterine tetany and rupture. **1** The FHR should be checked to determine the effect of the tetanic contractions on the fetus. **6** After the FHR is assessed then the maternal response to the interruption of the infusion should be assessed. **3** Following these measures, the primary care giver should be notified. **4** Fetal well-being will be improved when oxygen is administered. **5** After emergency measures have been taken, the maternal/fetal responses should be documented.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Induction or Stimulation of Labor; Nursing Care During the Intrapartum Period

**142. 1 An acceleration is an abrupt elevation above the baseline of 15 beats/min for 15 seconds; if the acceleration persists for more than 10 minutes, it is considered a change in baseline rate.**

**2** Early decelerations, not elevations, occur. An early deceleration starts before the peak of the uterine contraction and returns to the baseline when the uterine contraction ends. **3** A sonographic motion is not a fetal monitoring descriptive term. **4** A tachycardic FHR is above 160 beats/min.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**143. 1 This slow, deep breathing expands the spaces between the ribs and raises the abdominal muscles, allowing room for the uterus to expand and preventing painful pressure of the uterus against the abdominal wall.**

**2** Pelvic rocking is used to relieve pressure from back labor. **3** Panting is used to halt or delay the expulsion of the infant's head before complete dilation. **4** This breathing technique is used during the transition phase of the first stage; the client has not yet reached this phase.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**144. 2 Gastric peristalsis often ceases during periods of stress. Abdominal contractions put pressure on the stomach and can cause nausea and vomiting, increasing the risk for aspiration.**

**1** Although this is true, it is not the reason for withholding food or oral fluids during labor. **3** Although food may cause dyspepsia, the primary reason for withholding it is to prevent aspiration. **4** Gastric peristalsis is decreased, not increased, during the stress of labor and birth.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**145. 2 This is the most difficult part of labor, and the client needs encouragement and support to cope.**

**1** IV fluids may need to be increased because of the increase in metabolism. **3** Medication at this time will depress the newborn and is contraindicated. **4** Breathing patterns should be complex and require a high level of concentration to distract the client.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**146. 2 Blowing forcefully through the mouth controls the strong urge to push and allows for a controlled birth of the head.**

**1** This breathing pattern does not help to control expulsion of the fetus. **3** This is used during the latent phase of the first stage of labor; it is not helpful in overcoming the urge to push. **4** This is used during active labor when the cervix is 3 to 7 cm dilated; it is not helpful in overcoming the urge to push.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**147. 4 As the uterus rises into the abdominal cavity, the uterine ligaments become elongated and hypertrophied; raising both legs at the same time limits the tension placed on these ligaments.**

**1** Lifting the legs simultaneously does not affect circulation in the legs. **2** There is already pressure on the perineum from the head of the fetus; this maneuver eases tension on the uterine ligaments. **3** There is no effect on the fascia with this maneuver.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**148. 2 The bulging perineum indicates that the fetal head is on the pelvic floor and birth is imminent.**

**1, 3** This occurs during the transition phase or at the beginning of the second stage. **4** This describes the progress of labor; it is not a sign that birth is imminent.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**149. 2 Because oxytocin (Pitocin) promotes powerful uterine contractions, uterine tetany may occur. The oxytocin infusion must be stopped to prevent uterine rupture and fetal compromise.**

**1** Intense pain can be associated with strong uterine contractions; this is not a complication. **3** This is unrelated to uterine contractions. **4** This is not likely to occur when induction of labor is initiated.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Intrapartum Period, Data Base

**150. 2 The contractions in the second stage of labor are expulsive in nature; having the client push or bear down with the glottis open will hasten expulsion.**

**1** Contractions are now intense and the client will be unable to relax; relaxation occurs between contractions. **3, 4** These breathing patterns prevent pushing and should not be encouraged until the fetal head crowns (+4 station) and a controlled birth is desired.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**151. 2 A pudendal block provides anesthesia to the perineum.**

**1** This block affects only the perineum, not the bladder. **3** This block does not affect muscle control. **4** This block anesthetizes only the perineum, not the cervix or body of the uterus.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Data Base

**152. 3 These are the classic signs and symptoms of a vaginal hematoma.**

**1, 2** The signs and symptoms do not indicate this infection; the temperature would be elevated in the presence of infection. **4** This condition would reveal persistent vaginal bleeding with a decreasing blood pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**153. 3 When the placenta separates from the uterine wall, it tears blood vessels and results in a gush of blood from the vagina.**

**1** The uterus should become firm when the placenta begins to separate. **2** The fundus rises in the abdomen when the placenta separates. **4** The reverse occurs; as the placenta separates it descends into the vaginal introitus, and the umbilical cord appears longer and protrudes from the vagina.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**154. 4 Immediately after birth the fundus is palpated midway between the symphysis**

**pubis and the umbilicus.**

**1** The gradual descent of the uterus into the pelvic cavity takes about 2 weeks after the birth. **2** The fundus is never elevated this high. **3** The fundus is not this high until 1 hour after birth; when the uterus is deviated to the right, it usually indicates bladder distention.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**155. 1 Bradycardia (baseline FHR below 110 beats/min) indicates the fetus may be compromised, requiring medical intervention.**

**2** This may be dangerous; the fetus may be compromised, and time should not be spent on monitoring. **3** This not the priority at this time. **4** The expected FHR is 110 to 160 beats/min between contractions.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care

During the Intrapartum Period

**156. 2 A displaced and boggy uterus usually is caused by a full bladder; if the bladder is distended, the nurse should have the client void and then reassess the fundus, and if still boggy, massage until firm.**

**1** The oxytocin (Pitocin) infusion may need to be increased if voiding and fundal massage are ineffective; however, the health care provider must be notified to change the prescription. **3** This is necessary if the fundus remains boggy after the client has voided. **4** This is unnecessary at this time; correcting the boggy fundus is the priority.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 25, Intrapartum Period, Nursing Care

During the Intrapartum Period

**157. 3 Before any other action is taken, the client must empty her bladder. If she is unsuccessful despite measures to promote urination, such as running water, she will need to be catheterized.**

**1, 4** This action is useless and may be dangerous unless the bladder is empty. **2** The health care provider should be notified if the uterus remains boggy and above the umbilicus after the bladder has been emptied and the fundus massaged, if necessary.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Intrapartum Period, Nursing Care During the Intrapartum Period

**158. 4 Esophageal atresia is associated with hydramnios.**

**1** Cardiac defects are not associated with hydramnios. **2** Kidney disorders are associated with oligohydramnios, not hydramnios. **3** Diabetes in the newborn is not associated with hydramnios.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 25, Intrapartum Period, Data Base

**159. 1 This opens up an area of communication to determine what really is troubling the mother about feeding her baby.**

- 2** The nurse is aware that this is not the best method when using a bottle to feed an infant; the problem of time should be explored with the mother. **3** Holding can be accomplished at times other than feeding periods; this response does not explore the client's feelings. **4** Although this is true, the mother should not be challenged so directly; a more gentle explanation should be offered.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period
- 160. 2 Rooming-in provides time for the mother and newborn to be together; the mother can become acquainted with the infant more quickly.**
- 1** It is possible that the client does not want to breastfeed; attachment can be furthered by a variety of methods. **3** This will not promote bonding and attachment. **4** Although visiting in the nursery is unlimited for the parents, rooming-in is preferable.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period
- 161. 2 Family-centered childbearing should adapt care to the client's cultural system whenever possible.**
- 1** This is the nurse's responsibility. **3** This may be useful, but the primary intervention is to address the client's cultural needs. **4** This does not address the underlying problem.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period
- 162. 4 Family-centered care focuses on the whole family, including the relatives; visiting hours in the birthing unit are flexible.**
- 1** This is an inappropriate intervention; family-centered care focuses on the whole family, and the sister should be permitted to remain. **2** Written permission is not required. **3** There is no need for the nursing supervisor to be summoned.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period
- 163. 3 Heparin is the medication of choice during the acute phase of a deep vein thrombosis; it prevents conversion of fibrinogen to fibrin and of prothrombin to thrombin.**
- 1** Clopidogrel (Plavix) is a platelet aggregate inhibitor and is used to reduce the risk of a brain attack (CVA). **2** Warfarin (Coumadin) is a long-acting oral anticoagulant and is started after the acute stage has subsided; it is continued for 2 to 3 months. **4** A low molecular weight heparin (e.g., enoxaparin [Lovenox]) is not administered during the acute stage; it may be administered later to prevent future deep vein thromboses.
- Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Data Base

**164. 2 This action prevents the transfer of microorganisms from the hands to the genital tract or from the genital tract to the hands.**

**1** This is an inadequate number of changes; soiled pads promote the growth of microorganisms because they are warm and moist and provide a medium for growth. **3** This action interferes with the analgesic action of the spray and does not prevent infection. **4** This action promotes contamination of the vagina and urethra by organisms from the perianal area.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**165. 1 Retention of urine with overflow will be manifested in small, frequent voidings. The bladder should be palpated for distention.**

**2** An elevated temperature with urinary alterations would indicate impending infection. **3** More circulating fluid is present, causing an increased output. **4** The client usually is thirsty and fluid intake increases.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Postpartum Period, Data Base

**166. 3 A distended bladder will displace the fundus upward and laterally to the right.**

**1** This is manifested by slow contraction and uterine descent into the pelvis. **2** If this were true, in addition to being displaced, the uterus would be boggy and vaginal bleeding would be heavy. **4** From this assessment the nurse cannot make a judgment about overstretched uterine ligaments.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**167. 3 The fundus descends one fingerbreadth per day from the first postpartum day.**

**1, 2** If the fundus were at this level, the nurse should suspect that involution has been delayed and further investigation is required. **4** Although this is not expected, it is a benign occurrence.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**168. 4 There is extensive activation of the blood clotting factors after a birth; this, together with immobility, trauma, or sepsis, encourages thromboembolization, which can be limited through activity.**

**1** This can be accomplished by encouraging the client to turn from side to side and to deep breathe and cough. **2** Bladder tone is improved by the regular emptying and filling of the bladder. **3** Exercise during the next 6 weeks can strengthen the abdominal muscles.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**169. 1 Kegel exercises can be resumed immediately and should be done for the rest of the client's life because they help strengthen muscles needed for urinary continence and may enhance sexual intercourse.**

**2** Episiotomy sutures do not have to be removed. **3** Bowel movements should spontaneously return in 2 to 3 days after giving birth; a delay of bowel movements promotes constipation, perineal discomfort, and trauma. **4** The usual postpartum examination is 6 weeks after birth; menses can return earlier or later than this and should not be a factor when scheduling a postpartum examination.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**170. 1 Covered ice packs promote comfort by decreasing vasocongestion.**

**2, 3** Nipple stimulation precipitates the release of prolactin, which leads to more milk production and further engorgement and discomfort. **4** Emptying the breasts stimulates lactation, leading to further engorgement and discomfort.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**171. 1 Although thrombophlebitis is suspected, before a definitive diagnosis the client should be confined to bed so that further complications may be avoided.**

**2** This may cause vasodilation, which could allow a thrombus to dislodge and circulate freely. **3, 4** If a thrombus is present, this may dislodge it and lead to a pulmonary embolism.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**172. 2 The uterus responds rapidly to touch, and this involves the mother in her care.**

**1** The uterus must be massaged before there are signs of bleeding. **3** Although this may be beneficial, the client should be taught to massage the uterus to cause it to contract. **4** This does not actively involve the mother in her own care and could be unsafe if the uterus becomes boggy between the 15-minute time periods.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

**173. Answer: 2, 3, 4, 1, 5.**

**2** The culture should be obtained before antibiotics are given to ensure that the antibiotic does not interfere with accurate culture results. **3** The antibiotic is the most important of these orders and should be given as soon as possible to counteract any infective processes, but it should not be administered before obtaining the specimen for the culture. **4** The acetaminophen (Tylenol) is a comfort measure that can be administered at any time, but does not take precedence over the antibiotic. **1** Arranging for a chest radiograph will not interfere with implementing any of the other orders; it may take time to schedule a radiograph. **5** The client's response to the acetaminophen should

have lowered the client's temperature within 30 minutes.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 25, Postpartum Period, Nursing Care During the Postpartum Period

# **Nursing Care of Women at Risk during Pregnancy, Labor, Childbirth, and the Postpartum Period**

**174. 3 This response points out reality and allows the client to elaborate.**

**1** Although this is true, it does not allow for further communication. **2** This response implies that the nurse does not believe the client; it would probably cut off further communication. **4** This abdicates the nurse's responsibility; also, it may cut off further communication

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, The Pregnant Adolescent, Nursing Care

**175. 4 This indicates failure to resolve conflicting feelings about pregnancy that should have been resolved in the first trimester.**

**1** This response is an expected feeling in the third trimester. **2** This response is expected in the third trimester as the enlarging uterus limits the number of comfortable positions that can be assumed during sleep. **3** Concerns about the expected infant having physical abnormalities are common in the third trimester.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, The Pregnant Adolescent, Nursing Care

**176. 4 Fraternal twins may occur as a result of a hereditary trait, but it is related to the ovaries releasing two eggs during one ovulation; the fact that the father is a fraternal twin would not influence the female's ovaries to release two eggs during one ovulation.**

**1** Although this response is true, it does not answer the client's question. **2, 3** If there is no maternal family history of twin pregnancies, it would be a chance occurrence that is equal to the probability found in the general population.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, The Woman with a Multifetal Pregnancy, Data Base

**177. 2 This fundal height indicates a hydatidiform mole, a multiple gestation, or a fetal congenital anomaly; at 16 weeks' gestation the fundus is below the umbilicus. It does not rise to the umbilicus until 20 to 22 weeks.**

**1** Foot and ankle edema is common as pregnancy reaches term; the enlarged uterus presses on the femoral veins, impeding the flow of venous blood from the extremities. **3, 4** This heart rate is within the expected range during pregnancy.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Hydatidiform Mole or Trophoblastic Disease, Nursing Care

**178. 4 In an emergency surgical situation when invasive techniques are necessary, it is important to have a consent signed as well as a history of the client's known allergies.**

**1** This is not a priority in an emergency such as this. **2, 3** In an emergency these procedures, except for the enema, are done in the operating room; an enema usually is

not given before a cesarean, especially to a bleeding client, because it may stimulate contractions and further bleeding.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 26, Cesarean Birth, Data Base

**179. 2 This statement offers comfort measures while giving the client an opportunity to verbalize her concerns further if she desires.**

**1** This cuts off communication with the client. **3** The client's focus is on her prolonged discomfort; there is no indication that she has other concerns at this time. **4** The nurse should focus on the client, not on how other women may feel; this may cut off communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring, Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 26, Dystocia, Nursing Care

**180. 1 Antenatal glucocorticoid therapy is contraindicated when the client has an infection because the antiinflammatory effect may exacerbate the infection.**

**2** An available IV line should be maintained as well as monitoring the intake and output (I&O). **3** This is the usual protocol for monitoring the vital signs during preterm labor. **4** Measures to halt labor should be started.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 26, Preterm Labor, Data Base

**181. 4 Oxytocin (Pitocin) increases the intensity and duration of contractions; prolonged (tetanic) contractions will jeopardize the safety of the fetus and necessitate discontinuing the drug.**

**1** A bulging perineum indicates that there is complete cervical dilation and birth is imminent; because cervical dilation is only 2 to 3 cm, a bulging perineum is not expected. **2** This is important throughout labor. **3** There is no indication at this time that a cesarean birth is necessary.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Dystocia, Nursing Care

**182. 1 Oxytocin (Pitocin) is a small polypeptide hormone synthesized in the hypothalamus and secreted from the neurohypophysis (posterior pituitary gland) during parturition or suckling; it promotes powerful uterine contractions and thus is used to induce labor.**

**2** Estrogen (Premarin) suppresses the follicle-stimulating and luteinizing hormones, thus helping to maintain the pregnancy. **3** Ergonovine (Ergotrate) can lead to sustained contractions, which is contraindicated during labor; it may be prescribed in the postpartum period to promote or maintain a contracted uterus. **4** Progesterone (Prometrium) causes hyperplasia of the endometrium in preparation for implantation of the fertilized ovum; later it helps to maintain the pregnancy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Induction or Stimulation of Labor, Data Base

**183. Answer: 1, 2, 5.**

**1** Oxytocin (Pitocin) is an oxytocic that initiates or augments uterine contractions; it is used for labor induction. **2** Misoprostol (Cytotec) is a prostaglandin used for cervical ripening and labor induction. **3** Ergonovine (Ergotrate) is an oxytocic used for postpartum or postabortion hemorrhage. **4** Carboprost (Hemabate) is a prostaglandin used for postpartum hemorrhage; also used to induce abortion. **5** Dinoprostone (Prepidil) is used for cervical ripening to induce labor; also used to induce abortion.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Induction or Stimulation of Labor, Data Base

**184. 4 Terbutaline sulfate (Brethine) is a beta-mimetic that acts on the smooth muscles of the uterus to reduce contractility, which in turn inhibits dilation and the frequency and duration of contractions.**

**1** Although terbutaline may increase blood pressure and pulse, this is a side, not a therapeutic, effect requiring frequent assessments. **2** Terbutaline is not an analgesic. **3** Terbutaline should stop cervical dilation, rather than increase it.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Preterm Labor, Data Base

**185. 3 Magnesium sulfate has a CNS depressant effect; therefore, toxic levels will be reflected by the loss of the knee-jerk reflex.**

**1** The level of consciousness is decreased with excessive magnesium sulfate. **2** There is a deceleration in the respiratory rate with magnesium sulfate toxicity. **4** This may be caused by increased potassium, not magnesium sulfate.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

**186. 2 The client's slow pulse and respirations and the flushed face are signs of magnesium sulfate toxicity. The infusion should be stopped and the IV site should be maintained with an infusion of D5W because an antagonist (calcium gluconate) may be prescribed.**

**1** This is unsafe because continuing the infusion will make the CNS depression more severe. The health care provider should be notified after the infusion has been stopped. **3** These actions are unsafe. The client's clinical manifestations indicate a life-threatening condition. **4** It is unsafe to decrease the rate of the infusion because the CNS depression will worsen. The magnesium level should be obtained, but not before stopping the infusion.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

**187. Answer: 450 mL. Use the "Desire over Have" formula to solve the problem by using ratio and proportion.**

$$\frac{\text{Desire}}{\text{Have}} \frac{6 \text{ g}}{40 \text{ g}} = \frac{x \text{ mL}}{1000 \text{ mL}}$$

$$40 x = 6000$$

$$x = 6000 \div 40$$

$$x = 150$$

An infusion pump is set at milliliters per hour. 150 mL is needed in 20 minutes. There are 60 minutes in an hour; therefore,  $3 \times 150 = 450 \text{ mL/hr}$ .

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Medication

Administration, Nursing Responsibilities Related to Medication Administration

188. **4 Hyperreflexia of severe preeclampsia is 3+ to 4+; therefore, a deep tendon reflex of 2+, which is an active, expected reflex, indicates that a therapeutic level of the drug has been reached. A diminished or absent reflex indicates that the serum magnesium level is too high.**

**1** Because magnesium sulfate is a CNS depressant, a respiratory rate of 12 indicates that the serum magnesium level is too high. **2** Alterations in fetal activity are not indicators of a therapeutic magnesium sulfate level. **3** Oliguria is a sign of severe preeclampsia; diuresis is a therapeutic effect of magnesium sulfate administration.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

189. **4 This steroid enhances fetal lung maturity when administered before a preterm birth.**

**1, 3** These are tocolytic agents used to prevent preterm birth; this birth is inevitable. **2** Misoprostol (Cytotec) is used for labor induction.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Preterm Labor, Data Base

190. **2 This is the ideal time for chorionic villi sampling (CVS); this allows the client time to consider other options if a problem is discovered.**

**1** CVS is no longer done this early because it has been associated with digit reduction. **3** This is too late for CVS. **4** This is when a genetic amniocentesis is done.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Tests to Identify and/or Monitor High-Risk Pregnancy

**191. 3 The proliferation of trophoblastic tissue filled with fluid causes the uterus to enlarge more quickly than if a fetus were in the uterus.**

**1** Hypertension, not hypotension, often occurs with a molar pregnancy. **2** There is no fetus within an hydatidiform mole. **4** There may be slight painless vaginal bleeding.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Hydatidiform Mole or Trophoblastic Disease, Data Base

**192. 2 At this time the products of conception are too large for the tube to accommodate them, and rupture occurs.**

**1, 3** Tubal pregnancies cannot advance to this stage because of the tube's inability to expand to accommodate a pregnancy of this size. **4** The embryo is recognizable at this time (about 2 weeks after fertilization), but it is too small to cause the tube to rupture.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Ectopic Pregnancy, Data Base

**193. 3 A fallopian tube is unable to contain and sustain a pregnancy to term; as the fertilized ovum grows, there is excessive stretching or rupture of the affected fallopian tube, causing pain.**

**1** At this stage the products of conception are too small to form a mass; the pain is lateral, not centered. **2** The pain is sudden, intense, and knifelike, not prolonged or cramping. **4** Leukorrhea and dysuria may be indicative of a vaginal or bladder infection.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Ectopic Pregnancy, Data Base

**194. 1 Hemorrhage may result from retained placental tissue or uterine atony.**

**2** There is no indication that the client has been deprived of fluids. **3** Hypotension, not hypertension, may occur with postabortion hemorrhage. **4** Subinvolution is more likely to occur after a full-term birth.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Spontaneous Abortion, Nursing Care

**195. 4 About 75% of all spontaneous abortions take place between 8 and 12 weeks' gestation and show embryonic defects.**

**1** Though possible, physical trauma rarely causes an abortion. **2** Unresolved stress is rarely associated with spontaneous abortions. **3** Congenital defects are asymptomatic during pregnancy and do not usually cause an abortion.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Spontaneous Abortion, Data Base

**196. 3 Spotting in the first trimester may indicate that the client is having a threatened abortion; any client with the possibility of hemorrhage should not be left alone; therefore, her admission to the hospital ensures her safety.**

**1** A missed abortion may not cause any outward signs or symptoms, except that the signs

of pregnancy disappear. **2** An inevitable abortion can be confirmed only if vaginal examination reveals cervical dilation. **4** With an incomplete abortion some, but not all, of the products of conception have been expelled.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Spontaneous Abortion, Data Base

197. **4 After a spontaneous abortion the uterine fundus should be palpated for firmness, which indicates effective uterine tone. If the uterus is not firm or appears to be hypotonic, hemorrhage may occur; a soft or boggy uterus also may indicate retained placental tissue.**

**1** The nurse would do this if necessary after checking for fundal firmness. **2** This is not the priority; the potential for hemorrhage must be monitored. **3** This is unnecessary; fetal and placental contents are small and expelled easily.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Spontaneous Abortion, Nursing Care

198. **4 A correct and simple definition answers the question and fulfills the client's need to know.**

**1** This denies the client's right to know. **2** This is the definition of a missed abortion. **3** This abdicates the nurse's responsibility; the nurse can independently reinforce information and correct misconceptions.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Spontaneous Abortion, Data Base

199. **3 Ruptured membranes leave the products of conception exposed to bacterial invasion. Intact membranes act as a barrier against organisms that may cause an intrauterine infection.**

**1** This may occur during sex, but there is no evidence indicating that it is harmful for the fetus. **2** This is common because of increased production of mucus containing exfoliated vaginal epithelial cells; intercourse is not contraindicated. **4** Intercourse is not contraindicated if membranes are intact; modification of sexual positions may be needed because of the enlarged abdomen.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Premature Rupture of Membranes, Nursing Care

200. **4 A persistent occiput posterior position causes intense back pain because of fetal compression of the maternal sacral nerves.**

**1** Breech positions are not associated with back pain. **2** The transverse position usually does not cause back pain. **3** This is the most common fetal position and does not cause back pain.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Dystocia, Nursing Care

201. **3 The application of back pressure combined with frequent positional changes will help alleviate the discomfort.**

**1** Although this may be comfortable for some individuals, rubbing the back and alternating positions usually are more effective. **2** The supine position places increased pressure on the back and often aggravates the pain. **4** Neuromuscular control exercises are used to teach selective relaxation in childbirth classes; they will not relieve back pain during labor.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; Teaching/Learning; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 26, Dystocia, Nursing Care

**202. 3 Low back pain is aggravated when the mother is in the supine position because of increased pressure from the fetus.**

**1, 2, 4** This position helps relieve back pain.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 26, Dystocia, Nursing Care

**203. 4 Panting prevents the mother from putting pressure on the fetal head. The nurse applies gentle pressure against the fetus's head as it emerges to prevent a precipitous birth, which could result in CNS injury to the fetus and vaginal lacerations to the mother.**

**1** It is impossible to pant and push at the same time. **2** Breathing with the mouth closed promotes the bearing down reflex. **3** Bearing down during the birth is unsafe because both fetus and mother can be injured.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 26, Precipitate Birth, Nursing Care

**204. 2 Lacerations require less suture time and cause less perineal trauma, which can have lifelong implications such as rectal-vaginal fistulas.**

**1** Lacerations are less painful than an episiotomy and tend to heal more quickly. **3** An episiotomy causes more posterior trauma than lacerations. **4** Evidence indicates that a routine episiotomy policy results in more perineal trauma, more suturing time, and more complications than lacerations.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 26, Episiotomy, Data Base

**205. 3 The Centers for Disease Control and Prevention (CDC) recommends that gloves should be worn when there is potential contact with blood or other body fluids.**

**1** Even if the client does not have an infection, gloves are always worn when exposure to blood or other body fluids is a possibility. **2** All blood is considered to be potentially infectious. **4** Nurses are required to take precautions that limit exposure; gloves must be worn.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Evaluation/Outcomes; **Reference:** Ch 26, Postpartum Bleeding, Nursing Care

**206. 1 Heat causes vasodilation and an increased blood supply to the area.**

**2** Cleansing is done with a perineal bottle and cleansing solution immediately after voiding and defecating. **3** Sitz baths do not soften the incision site. **4** Neither relaxation

nor tightening of the rectal sphincter will increase healing of an episiotomy.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Episiotomy, Nursing Care

**207. 2 The nurse should position the newborn with head slightly lower than the chest to allow mucus to flow by gravity and then rub the back to stimulate crying, which promotes oxygenation.**

**1** This is not the priority; there is no need for haste in cutting the cord. **3** This is not the priority; the uterus still contains the placenta and will not contract. **4** This is not the priority; the well-being of the newborn and mother must be confirmed before moving them.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Precipitate Birth, Nursing Care

**208. Answer: 1, 2, 4, 5.**

**1** Increased risk for developing preterm labor is age associated; it occurs more commonly in older primigravidas and adolescents. **2** Mature women have an increased incidence of multiple gestation secondary to fertility drug use and in vitro fertilization. **3** This is not seen more frequently in mature gravidas. **4** After 35 years of age, mature women have an increased risk of having children with chromosomal abnormalities. **5** Bleeding in the first trimester as a result of spontaneous abortion occurs more frequently in mature gravidas.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, The Older Pregnant Woman, Data Base

**209. 2 About two thirds of neonatal deaths are associated with preterm births; there appears to be a correlation with teenage and older age pregnancies, lack of prenatal care, women who are nonwhite, and those who have chronic health problems.**

**1** Atelectasis may occur from respiratory distress, which in turn is associated with preterm births, the leading cause of death. **3** Most infants who die from congenital heart disease die after the neonatal period. **4** This is one complication of a preterm birth.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Preterm Labor, Data Base

**210. Answer: 2, 4, 5.**

**1** The contraction stress test (CST) is indicated to assess the influence of hypertension on the placental circulation. **2** The CST could trigger a preterm birth in a woman who is in preterm labor or has a history of preterm births. **3** The CST is indicated to determine the response of the compromised fetus to labor. **4** The CST could trigger a preterm birth in a woman who has had the Shirodkar procedure for an incompetent cervical os because it would exert pressure on the sutures and may cause them to rupture. **5** The CST could trigger a preterm birth in a woman whose membranes have ruptured prematurely; the woman is at risk for a preterm birth already.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Tests to Identify and/or Monitor High-Risk

## Pregnancy

**211. 4 A positive contraction stress test (CST) indicates a compromised fetus with late decelerations during contractions; this is associated with uteroplacental insufficiency.**

**1** Preeclampsia does not cause a positive CST unless the fetus is compromised. **2** Ultrasonography demonstrates placenta previa; a CST is contraindicated because it may induce labor. **3** A CST is contraindicated for a woman with a suspected preterm birth or a pregnancy of less than 33 weeks' gestation because it may induce labor.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Tests to Identify and/or Monitor High-Risk Pregnancy

**212. 4 It is not uncommon for adolescents to avoid prenatal care; many do not recognize the deleterious effect that lack of prenatal care can have on them and their infants.**

**1** This can be done in the later part of pregnancy and reinforced during the postpartum period. **2** This should come later in pregnancy, but not before ascertaining the client's feelings about breastfeeding. **3** This will have to be done, but it is not the priority intervention at this time.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, The Pregnant Adolescent, Nursing Care

**213. 2 Perinatal morbidity and mortality rates are higher with a multiple-gestation pregnancy because the greater metabolic demands and the possibility of malpositioning of one or more fetuses increases the risk for complications.**

**1** Although postpartum hemorrhage does occur more frequently after multiple births, it is not an expected occurrence. **3** Maternal mortality during the prenatal period is not increased in the presence of a multiple gestation. **4** Adjustment to a multiple gestation and birth is individual; the time needed for adjustment does not place the pregnancy at high risk.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, The Woman with a Multifetal Pregnancy, Data Base

**214. 1 A multiple gestation thins the uterine wall by overstretching; thus, the efficiency of contractions is reduced.**

**2** Gestational anemia is physiologic anemia that is benign; although anemia may cause fatigue during labor, it does not affect uterine contractility. **3** Hypertonic contractions will cause increased discomfort, fatigue, dehydration, and increased emotional distress, not hypotonic uterine dystocia. Therapeutic interventions include rest and sedation. **4** Gestational hypertension may trigger preterm labor; it does not cause hypotonic uterine dysfunction.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, The Woman with a Multifetal Pregnancy, Data Base

**215. 2 Placenta previa is defined as an abnormally implanted placenta in the thin, lower-**

uterine segment (i.e., low-lying, partially covering, or completely covering the cervical os).

1 This can occur at any time; it is not specific to a low-lying placenta. 3 This can occur with a normally implanted placenta. 4 This can occur at any time with or without a low-lying placenta.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Placenta Previa, Data Base

216. 3 **Pyelonephritis often causes preterm labor, leading to increased neonatal morbidity and mortality.**

1 Fluids should be increased; the inflammatory process may lead to fever, dehydration, and an accumulation of toxins. 2 Proteinuria occurs with preeclampsia; the client's signs and symptoms are indicative of a kidney infection. 4 This is not relevant to the client's problem.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Preterm Labor, Data Base

217. 2 **Health care supervision requires treatment with an appropriate antibiotic until two cultures of urine are negative; recurring pyelonephritis often leads to preterm birth.**

1 Preeclampsia is not preceded by specific infections. 3 Pelvic inflammatory disease (PID) is associated with infections of the genital, not the urinary, tract. 4 A low-protein diet inhibits fetal development and is contraindicated during pregnancy.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Preterm Labor, Data Base

218. 2 **Chromosomal anomalies are not associated with a multiple gestation; therefore, the client needs further instruction.**

1 Preterm birth with multiple gestation occurs for a variety of reasons such as spontaneous rupture of the membranes, abruptio placentae, and marked uterine distention. 3 Shunting of blood between placentas can occur with a multiple gestation if there are multiple placentas. 4 The increased blood volume and metabolism necessary to sustain a multiple gestation predispose the client to hypertension.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, The Woman with a Multifetal Pregnancy, Data Base

219. 4 **Severe pain accompanied by bleeding at term or close to it is symptomatic of complete premature detachment of the placenta (abruptio placentae).**

1 A hydatidiform mole is diagnosed before 36 weeks' gestation; it is not accompanied by severe pain. 2 There is no bleeding with vena caval syndrome. 3 Bleeding caused by placenta previa should not be painful.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Abruptio Placentae, Data Base

220. 2 **The blood cannot escape from behind the placenta; thus, the abdomen becomes boardlike and painful because of the entrapment of blood.**

1 Signs and symptoms of hemorrhagic shock do not include pain. 3 This is not related to the initial pain of abruptio placentae; eventually blood at the site of placental

separation may seep into the uterine muscle (Couvelaire uterus). 4 This is not related to the initial pain of abruptio placentae; it is a life-threatening complication.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Abruptio Placentae, Data Base

**221. 1 The client's clinical manifestations suggest abruptio placentae, and her vital signs indicate that shock may be occurring; the priority is to determine fetal viability so that appropriate treatment may be instituted immediately.**

2 Preparing for a cesarean birth is premature until fetal viability is determined. 3 Obtaining a blood sample before assessing the status of the fetus is unsafe. 4 The amount of vaginal bleeding is not relevant because there may be hidden bleeding.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Abruptio Placentae, Nursing Care

**222. 4 Clotting defects are common in moderate and severe abruptio placentae because of the loss of fibrinogen caused by copious internal bleeding.**

1 An excessive amount of RBCs is not related to the depletion of fibrinogen. 2 The bleeding with abruptio placentae is caused by depletion of fibrinogen, not thrombocytes (platelets). 3 Excessive globulin in the blood is unrelated to clotting.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Abruptio Placentae, Data Base

**223. 3 Hypertension during pregnancy leads to vasospasms; this in turn causes the placenta to tear away from the uterine wall (abruptio placentae).**

1 Generally cardiac disease does not cause abruptio placentae. 2 This may cause an endocrine disturbance in the infant but does not affect the blood supply to the uterus. 4 This may affect the birth of the fetus but does not affect the placenta.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Abruptio Placentae, Data Base

**224. 1 Placenta previa is classically painless bleeding; the placenta partially or completely covers the cervical os, and as the cervix dilates, the placenta separates and bleeds.**

2 Placenta accreta is an abnormally adherent placenta; the placenta attaches through the endometrium to the myometrium. 3 A ruptured uterus is a painful occurrence; the fetus may be expelled from the uterus into the abdomen. 4 There is no visible bleeding if the abruptio is concealed; abruptio placentae is painful because the blood accumulates between the placenta and the uterine muscle.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Placenta Previa, Data Base

**225. 3 Observation and documentation of bleeding are necessary for implementing safe care because hemorrhage and shock can be life-threatening.**

1 Vital signs should be checked more often while there is bleeding. 2 This is contraindicated because it may cause further separation of the placenta. 4 The client should be restricted to complete bed rest until bleeding stops.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 26, Placenta Previa, Nursing Care

**226. 3 Abruptio placentae is associated with cocaine use; it occurs in the third trimester.**

**1** Placenta previa is seen in the third trimester but is not associated with cocaine use. **2** A tubal pregnancy is identified in the first trimester. **4** Spontaneous abortion occurs in the first 2 trimesters.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Abruptio Placentae, Data Base

**227. 2 Prostaglandins in semen may stimulate labor, and penile contact with the cervix may increase myometrial contractility.**

**1** Sexual intercourse may cause labor to progress; it is contraindicated for the rest of the pregnancy. **3** The position is irrelevant; sexual intercourse is contraindicated for the rest of the pregnancy. **4** Regardless of the extent of penile penetration, sexual intercourse may precipitate labor; it is contraindicated for the rest of the pregnancy.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Preterm Labor, Nursing Care

**228. 1 Uterine atony often results from an overdistended uterus; uterine contractions do not occur readily and the uterus fills with blood.**

**2** This might cause a hematoma to form, but not a hemorrhage. **3** This is unusual; it may cause some bleeding, but not a hemorrhage. **4** This can occur in single, not just multiple, births if the placenta has not been carefully inspected for tears.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, The Woman with a Multifetal Pregnancy, Data Base

**229. 4 Once the membranes have ruptured, the active herpes infection ascends and can infect the fetus; since herpes does not cross the placenta, a cesarean birth prevents transfer of the virus to the fetus.**

**1, 2, 3** This is not an indication for a cesarean birth; treatment is pharmacological.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Cesarean Birth, Data Base

**230. 2 This is the treatment of choice for complete placental separation (abruptio placentae). The risk for fetal and maternal mortality is too high to delay action.**

**1** A high-forceps birth rarely is used because the forceps may further complicate the situation by tearing the cervix. **3, 4** The fetus would probably expire if this course of action were taken.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Abruptio Placentae, Data Base

**231. 1 A multipara with a shoulder presentation is indicative of a transverse lie; this necessitates a cesarean birth.**

**2** It is not uncommon for the fetus of a multipara to be high at the beginning of labor; early engagement occurs more often with a primigravida. **3** With an occiput posterior position the labor may be longer, but usually the mother can give birth vaginally. **4** If the first twin is in the vertex presentation, a vaginal birth will be attempted with a

double setup; if possible, the birth of the second twin also will be attempted vaginally.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 26, Cesarean Birth, Data Base

**232. 4 It is expected that up to two perineal pads can be saturated in the first hour.**

**1** A scant flow probably would not saturate even one pad. **2** Hemorrhage would saturate more than two pads in 1 hour. **3** This would be accompanied by heavy bleeding and require more than two pads during the first hour.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Cesarean Birth, Nursing Care

**233. 1 A first pregnancy and obesity are both documented risk factors for a hypertensive disorder of pregnancy.**

**2** The risk for a hypertensive disorder of pregnancy increases when the client is younger than 20 years of age and older than 35 years of age. **3, 4** This is not a documented risk factor.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**234. 4 A blood pressure more than 140 mm Hg systolic and 90 mm Hg diastolic along with proteinuria is diagnostic of preeclampsia; assessments should be done twice 4 to 6 hours apart.**

**1** Hypertension alone does not support a diagnosis of preeclampsia. **2** Hypertension accompanied by a headache is not necessarily indicative of preeclampsia. **3** This can occur at any time, not specifically in clients with gestational hypertension.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**235. Answer: 1, 3, 5.**

**1** Headache in severe preeclampsia is related to cerebral edema. **2** Constipation is not related to preeclampsia. **3** Abdominal pain in severe preeclampsia is related to decreased circulating blood volume and generalized edema. **4** Vaginal bleeding is not associated with preeclampsia. **5** Visual disturbances in severe preeclampsia are related to retinal edema.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**236. 4 This is a sign of CNS involvement that the nurse can observe without obtaining subjective data from the client. It is a sign of an impending seizure.**

**1, 2, 3** These are clinical manifestations of severe preeclampsia, not eclampsia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:**

Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

**237. 1 Padded side rails prevent injury during the clonic-tonic phase of a seizure. The client must be protected from injury if there is a seizure.**

2 Although some clients have an aura before a seizure, there is not enough time to use a call button and wait for help. 3 Oxygen is useless during a seizure when the client is not breathing and/or is thrashing about. 4 Assigning a staff member to stay with the client in anticipation of a seizure is impractical and unproductive.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

238. 3 The danger of a seizure in a woman with eclampsia subsides when postpartum diuresis has occurred, usually 48 hours after birth; however, the risk for seizures may remain for up to 2 weeks postpartum.

1, 2, 4 This is too soon.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

239. 3 Distribution of the fingers around the head will prevent a rapid change in intracranial pressure while the head is being born and keeps the head from “popping out,” causing maternal perineal trauma.

1 This will not assist with the birth of the head. 2 This may interfere with the birth and harm the neonate. 4 This could injure the neonate.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Precipitate Birth, Nursing Care

240. 4 A position in which the mother’s head is below the level of the hips helps decrease compression of the cord and therefore maintains the blood supply to the fetus.

1 This position is impossible to maintain and will not relieve the pressure of the oncoming head on the cord. 2 This will increase the pressure of the presenting part on the cord. 3 The pressure of the presenting part on the cord is not relieved in this position. Also, pressure on the vena cava will ultimately decrease placental perfusion.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Breech Birth, Nursing Care

241. 3 The heart rate increases by about 10 beats/min in the last half of pregnancy; this increase, plus the increase in total blood volume, can strain a damaged heart beyond the point at which it can efficiently compensate.

1 The number of RBCs does not decrease during pregnancy. 2 The increased size of the uterus is related to the growth of the fetus, not to any hemodynamic change. 4 Cardiac output begins to decrease by the 34th week of gestation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Heart Disease, Data Base

242. 4 This is the most critical period because of the rapid shift of extravascular fluid as it returns to the bloodstream; this mobilization of fluid can compromise the heart and lead to cardiac decompensation.

1 During the first trimester the increased amount of circulating blood volume is minimal and occurs gradually; thus, it does not place an unusual burden on the heart. 2 The risk for cardiac decompensation increases as pregnancy progresses; however, the increase

in blood volume occurs gradually, and the mother is monitored closely. **3** There is an increased risk for stress on the heart during labor; however, close monitoring and the use of agents to provide rest and pain relief have decreased these risks.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Heart Disease, Nursing Care

**243. Answer: 1, 3, 4.**

**1** An oxytocin (Syntocinon) infusion is carefully monitored for the gentle induction or augmentation of labor. **2** A midforceps assisted birth is not needed. A low or outlet forceps may be used to reduce the need to push and to conserve energy. **3** The health care provider may prefer a vacuum extraction assisted birth to reduce the need to push and to conserve energy. **4** Regional anesthesia relieves the stress of pain, and it does not compromise cardiovascular function. **5** Inhalation anesthesia is contraindicated because it could compromise cardiovascular function.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Heart Disease, Nursing Care

**244. 3 Elevating the client's head facilitates easier oxygen exchange, and the left side-lying position promotes venous return.**

**1** This is too uncomfortable; the gravid uterus will impede venous return from the legs. **2** Although this position is comfortable, the gravid uterus may inhibit venous return and result in placental congestion and supine hypotension. **4** At full term, the left side-lying position is preferred to the right side-lying position to enhance venous return.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Heart Disease, Nursing Care

**245. 3 Clients with cardiac problems are prone to heart failure during active labor; crackles indicate the presence of pulmonary edema.**

**1, 2** This is done for all clients who are in labor. **4** This is not necessary; although clients who are in labor are maintained on the side to facilitate venous return, the sides do not have to be alternated every 15 minutes.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Heart Disease, Nursing Care

**246. 1 Usually as pregnancy progresses, there are alterations in glucose tolerance and in the metabolism and utilization of insulin. The result is an increased need for exogenous insulin.**

**2** Antihypertensives are administered only to clients with severe hypertensive preeclampsia. **3** Pancreatic enzymes or hormones other than insulin are not taken by pregnant women with diabetes. **4** Estrogenic hormones are not administered during pregnancy.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Diabetes Mellitus, Data Base

**247. 3 Insulin requirements may fall suddenly during the first 24 to 48 postpartum hours**

**because the endocrine changes of pregnancy are reversed.**

**1** Insulin requirements do not suddenly increase at this time. **2** Insulin requirements do not remain unchanged at this time. **4** Insulin requirements do not slowly and steadily decrease at this time.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Diabetes Mellitus, Data Base

**248. 4 The client should receive nothing by mouth while heavy bleeding continues because surgical intervention may become necessary.**

**1** Providing oral fluids at this time is inappropriate and could result in aspiration if surgery becomes necessary. **2** The nurse does not need an order to give fluids to a postpartum client; the nurse must make an independent judgment regarding the withholding of fluids. **3** Although oral fluids can increase the blood volume, it would be inappropriate to provide fluids while the client is bleeding.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Postpartum Bleeding, Nursing Care

**249. 4 Multiple full-term pregnancies and births result in overstretched uterine muscles that do not contract efficiently, and bleeding may ensue. Oxytocin (Pitocin) promotes uterine contractions.**

**1** A precipitous birth does not predispose to uterine atony unless there is a complication. **2** Giving birth outside the birthing area does not predispose the client to uterine atony. **3** Multiparity does not predispose to retained placental fragments.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Postpartum Bleeding, Data Base

**250. Answer: 1, 2, 4.**

**1** Overdistention of the uterus may lead to delayed or inadequate uterine contractions. **2** An overdistended bladder may inhibit uterine contractions. **3** Clients with ineffective uterine contractions are treated with rest and sedatives; although labor is prolonged, postpartum hemorrhage is not expected. **4** Retained placental fragments inhibit uterine contractions. **5** Mild gestational hypertension does not interfere with uterine involution.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Postpartum Bleeding, Data Base

**251. 2 Blood loss depletes the cellular response to infection; trauma provides an excellent avenue for bacteria to enter.**

**1** These may create problems if hemorrhage occurs because the hemoglobin and hematocrit are already low. **3** Preeclampsia is not a predisposing cause of postpartum infection; retained placental fragments cause hemorrhage and if not removed immediately will result in hypovolemic shock, not infection. **4** Endogenous infections are rare; infections usually are caused by outside contamination. Trauma and the denuded placental site may contribute to the development of infection.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Postpartum Bleeding, Data Base

**252. 2 The heartbeat can drop as low as 50 beats/min for up to 10 days after the birth. It occurs because of the decreased blood volume, and increased stroke volume after the pregnancy has terminated.**

**1** A thready pulse may be a sign of postpartum hemorrhage with impending shock. **3** A bounding pulse may be a sign of hypertension. Although there may be a slight rise in blood pressure for several days, hypertension is not expected. **4** An irregular heartbeat may be a sign of cardiac decompensation that requires further investigation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 25, Postpartum Period, Data Base

**253. 2 With the mobilization of extravascular fluid and the rapid decrease in uterine blood flow, the heart of a client with a cardiac problem may begin to fail. As the heart fails, the respiratory rate and effort increase in an attempt to maintain oxygen to all body cells.**

**1** Although pulse rate is important, the primary assessment should be for respiratory distress. **3** Signs of heart failure, not hypovolemic shock, might develop if the respiratory distress is not treated. **4** Increased vaginal bleeding is not caused by alterations in cardiac status.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 26, Heart Disease, Nursing Care

**254. 4 Glucose-oxidase strips are used by nurses to screen infants for hypoglycemia.**

**1, 2** This test is not used to screen for hypoglycemia. **3** Fasting blood glucose levels are not used routinely to screen newborns for hypoglycemia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Diabetes Mellitus, Nursing Care

**255. 2 The infant of a diabetic mother (IDM) is a newborn at risk because of the interaction between the maternal disease and the developing fetus.**

**1** A newborn of a mother with type 1 diabetes generally is hypoglycemic because of oversecretion of insulin by the newborn's hypertrophied pancreas. **3** A newborn of a mother with type 1 diabetes is at high risk and requires intensive care. **4** The newborn of a mother with type 1 diabetes is prone to hypoglycemia and probably will need increased glucose.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 26, Diabetes Mellitus, Nursing Care

**256. 1 The pancreas of a fetus of a diabetic mother responds to the mother's hyperglycemia by secreting large amounts of insulin; this leads to hypoglycemia after birth.**

**2** Hypocalcemia, not hypercalcemia, occurs. **3** Edema may be generalized, not specific to the CNS. **4** In response to the increased glucose received from the mother, the islets of Langerhans in the fetus may have become hypertrophied; they are not congenitally depressed.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 26, Diabetes Mellitus, Nursing Care

# Nursing Care of the Newborn

**257. 1 By demonstrating acceptance of the infant, without regard for the defect, the nurse acts as a role model for the parents, thus enhancing their acceptance.**

**2** Infants with cleft palates can remain in the newborn nursery; they should not be hidden. **3** This is false reassurance; it does not promote parent-infant attachment behaviors. **4** This will delay attachment; the parents should be encouraged to have frequent contact with their infant.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Nursing Care Common to All Newborns

**258. 4 Mothers need to explore their infants visually and tactilely to assure themselves that their infants are healthy.**

**1** This comment closes off communication with the mother at an opportune moment. **2** A strong cry is not indicative of a healthy newborn. **3** The “normalcy” of the mother’s pregnancy does not necessarily have a relationship to the health of the newborn.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Parent-Infant Relationships

**259. 2 Holding, touching, and interacting with the newborn while providing basic care promotes attachment.**

**1** The nurse’s infant feeding preference should not be forced upon the mother. **3** Although rooming-in helps promote attachment, not all women have the physical or emotional ability to provide 24 hour care to the newborn so early in the postpartum period. **4** Early observation is not adequate; this can be done only by allowing the mother ample time to interact with her baby.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Parent-Infant Relationships

**260. 1 The mother has moved into the taking-hold phase when she takes control and becomes actively involved with her infant and calls the infant by name. She has completed the taking-in phase when her own needs no longer predominate.**

**2** This occurs in the taking-in phase when she has the need to integrate the experience. **3** This is the initial early action of the taking-in phase. **4** This is part of the taking-in phase.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Parent-Infant Relationships

**261. 1 Attachment between parent and infant is most successful when interaction is possible immediately after birth; if the infant is ill, contact is limited.**

**2** Although the duration and difficulty of labor is a factor, the most important factor is the physical condition of the infant. **3** Although the effect of anesthesia is a factor, the most important one is the physical condition of the infant. **4** Health and emotional status during pregnancy may be factors, but the most important factor after the birth

is the physical condition of the infant.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Parent-Infant Relationships

**262. 3 Parenting is a learned behavior based on past experiences and current motivation to learn.**

**1** Parenting is learned, not inborn. **2** Specific marital roles do not influence parenting behaviors. **4** Knowledge alone does not ensure the ability to parent.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Parent-Infant Relationships

**263. 4 This mother is at risk for having difficulty with attachment because her baby did not meet her expectations.**

**1** Unplanned pregnancies usually do not pose a risk for attachment problems because the decision was made to continue the pregnancy, allowing time to accept it. **2** Reliving the birthing experience, whether it involves positive or negative feelings, occurs during the first few postpartum days during the taking-in phase. Unless there are other emotional problems, these feelings are resolved during this phase, and then the mother moves into the taking-hold phase, which initiates the attachment process. **3** Ambivalent feelings during the first trimester are common and usually resolve during the second trimester.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 27, Parent-Infant Relationships

**264. 2 This immunity is developed from an antigen-antibody response in the mother that is transmitted to the fetus.**

**1** This is acquired by an individual in response to a disease or an infection. **3** This is acquired by an individual in response to small amounts of antigenic material (e.g., vaccination). **4** This is conferred by the injection of antibodies already prepared in another host.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**265. 3 A quiet, alert state is an optimum time for infant stimulation.**

**1** Bright lights are disturbing to newborns and may impede mother-infant interaction. **2** This position is used for the sleeping infant. **4** Physical and behavioral assessments are not the priorities; they can be delayed.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Parent-Infant Relationships

**266. Answer: 9. A value of 1 is assigned to the color category (acrocyanosis); a value of 2 is assigned to the heart rate that is within the expected range of 100 to 160 beats/min; the flexed extremities reflect healthy muscle tone; and a lusty cry represents the other two categories—reflex irritability and respiratory rate—each of which is assigned a value of 2. The Apgar score is 9, demonstrating a healthy newborn.**

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**267. 1 The heart rate is vital for life and is the most critical observation in Apgar scoring.**

**2** Respiratory effort rather than rate is included in the Apgar score; the rate is very erratic. **3** This may or may not be present at this time and is not a part of Apgar scoring. **4** This is not a part of Apgar scoring but should be assessed later.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**268. 3 The newborn's heart rate varies with activity; crying can increase it to 180 beats/min, whereas deep sleep may lower it to 80 to 100 beats/min; a rate between 110 and 160 beats/min is the average.**

**1, 2** The heart rate of an alert, noncrying newborn that is above 160 beats/min indicates tachycardia. **4** The heart rate of an alert, noncrying newborn that is below 110 beats/min indicates bradycardia.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**269. 1 The initial response is a reflection of the startle reflex; when the stimulus is repetitive, the response to the stimulus decreases; this decrease in response is called habituation and is expected.**

**2, 4** This is not necessary because the neonate's response is expected. **3** The infant is responding to noise and therefore hears.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Adaptation to Extrauterine Life

**270. Answer: 1, 3, 4.**

**1** Full-term neonates have a flexed fetal position, which conserves heat. **2** Insulin is not stored in the liver and is not involved with maintaining neonatal body temperature. **3** Brown fat is deposited at 28 weeks' gestation and continues for the rest of the pregnancy; when the newborn's body becomes cool, the sympathetic nervous system stimulates the breakdown of brown fat, which releases heat as a by-product. **4** Peripheral vasoconstriction helps to conserve heat by keeping the central core warm and preventing heat from dissipating. **5** The sympathetic, not parasympathetic, nervous system is involved in thermoregulation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**271. 4 The expected breathing patterns are abdominal and irregular in rhythm and depth (alternates between shallow and deep); the expected rate ranges from 30 to 60 breaths/min.**

**1** Newborns' respirations are irregular and abdominal. **2** Newborns' respirations are abdominal. **3** Newborns' respirations are irregular.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**272. 2 Cyanosis, choking, and coughing are signs of aspiration and hypoxia. Suctioning and oxygenation are needed.**

**1** Crying may add to the distress. **3** The water may be aspirated and intensify the problem. **4** This is unsafe; the newborn is showing signs of a blocked airway.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Adaptation to Extrauterine Life

**273. 1 The mucus must be removed to maintain a patent airway and promote respirations and gaseous exchange.**

**2** Oxygenation is ineffective if the airway is obstructed. **3** Documentation is important, but it is not the priority. **4** This is done to aspirate stomach contents, not to clear the airway.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Nursing Care Common to Newborns

**274. 2 The Moro reflex is a sudden extension and abduction of the arms at the shoulders and spreading of the fingers. This is followed by flexion and adduction of the arms with the index finger and thumb forming the letter "C"; the infant may cry.**

**1** Extension and abduction, not adduction, is the first part of the Moro reflex. **3** Although the reflex response includes adduction of the arms, the toes are not involved. **4** Although the reflex starts with extension of the arms, the fingers fan out before forming the "C" position.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Nursing Care Common to Newborns

**275. 1 Milia are common, are not indicative of illness, and eventually disappear.**

**2** Lanugo is fine, downy hair. **3** This is a lay term for milia; it is not used when documenting. **4** These are bluish black areas on the buttocks that may be present on dark-skinned infants.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Nursing Care Common to Newborns

**276. 3 The tonic neck reflex (fencing position) is a spontaneous postural reflex of the newborn; it persists until the third month.**

**1** The Moro reflex is exhibited when a sudden change in equilibrium causes extension and abduction of the extremities followed by flexion and adduction. **2** The Babinski reflex is exhibited when the examiner runs a finger up the lateral (small toe side) undersurface of the foot from the heel to the toes and then across the ball of the foot; the toes separate and flare out. **4** The palmar grasp reflex is exhibited when the fingers flex around a person's finger as it is placed in the infant's palm.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Nursing Care Common to Newborns

**277. 3 Bacteria, especially *Escherichia coli*, produce substances necessary to synthesize prothrombin.**

**1** This is an orange bile pigment produced by the breakdown of hemoglobin. **2** Bile salts are manufactured in the liver, not synthesized by bacteria. **4** This is secreted by the gastric glands, not synthesized by bacteria.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**278. 4 In 36 to 48 hours the newborn will have ingested an ample amount of the amino acid phenylalanine, which if not metabolized because of a lack of a specific liver enzyme, can result in excess levels of phenylalanine in the bloodstream and brain, resulting in mental retardation; early detection is essential to prevent this.**

**1** The infant will have a vitamin K injection soon after birth to prevent bleeding problems. **2** Blood is withdrawn from the heel soon after birth to test for hypoglycemia. **3** Necrotizing enterocolitis is a disorder that can affect preterm infants. It is not identified by a test.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Adaptation to Extrauterine Life

**279. 1 Phenylalanine is an essential amino acid necessary for growth that may be absent in infants with phenylketonuria (PKU); testing is done on all neonates born in the United States.**

**2** Untreated PKU can lead to retardation; the test will not identify retardation. **3** PKU is a genetic, not a chromosomal, disorder. **4** This is done at the same time as PKU testing, but thyroid deficiency is a problem related to a hormone deficiency, not to PKU.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Adaptation to Extrauterine Life

**280. 2 Hypoglycemia causes CNS and sympathetic nervous symptom responses.**

**1, 3, 4** These are not signs of this problem.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

**281. 4 There is a sensitive period in the first minutes or hours after birth during which it is important for later interpersonal development that the parents have close contact with their newborn.**

**1** Rooming-in may not be instituted immediately after birth. **2** Taking-in is a maternal psychologic behavior described by Reva Rubin that occurs during the first 2 postpartum days. **3** Taking-hold is a maternal psychologic behavior described by Reva Rubin that occurs after the third postpartum day.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Parent-Infant Relationships

**282. 1 Some maternal oxytocin crosses the placenta and induces the secretion of fluids that have accumulated in the fetal breasts (sometimes called "witch's milk").**

- 2 This usually is manifested as white, adherent patches in the oral mucosa (thrush). 3 This is uncommon and usually undetectable in the newborn period. 4 Evidence of infection would not appear so rapidly after birth.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Nursing Care Common to Newborns
283. 3 **Newborns' eye movements are uncoordinated and the eyes appear crossed as they try to focus. As the eye muscles mature, the apparent strabismus disappears.**  
 1 This discounts the mother's concern and is demeaning. 2 Although this is true, the mother should be given an explanation for the apparent strabismus. 4 This is misinformation that will increase the mother's anxiety.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Nursing Care Common to All Newborns
284. 2 **Teaching the mother by example is a nonthreatening approach that allows her to proceed at her own pace.**  
 1 Learning does not occur by schedule; questions must be answered as they arise. 3 Mothers need demonstration of appropriate mothering skills, not just a discussion. 4 Although emotional support is required, the plan should encourage independent caregiving.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Nursing Care Common to Newborns
285. 2 **The antibodies in human milk provide the infant with immunity against all or most of the pathogens that the mother has encountered.**  
 1, 3 These are present in commercial formulas. 4 Complex carbohydrates are not required by the infant.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Adaptation to Extrauterine Life
286. **Answer: 1, 3, 4.**  
 1 These infants have low glycogen stores. 2 These infants are not at risk for developing hypoglycemia. They are at risk for congenital cardiac defects. 3 These infants have low glycogen stores. 4 These infants are prone to hyperinsulinemia; often they have mothers who have diabetes, which exposes them to high circulating glucose levels while in utero. After prolonged exposure to high glucose levels, hyperplasia of the pancreas occurs, resulting in hyperinsulinemia. 5 These infants are not at risk for developing hypoglycemia.  
**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life
287. 4 **The congenital absence of a blood vessel in the umbilical cord is often associated with life-threatening congenital anomalies. There should be two arteries and one vein.**  
 1 It is too soon to determine if the newborn needs prolonged follow-up care; the second

Apgar score 5 minutes later determines this. **2** This is the average weight for a full-term newborn. **3** The expected glucose level in a healthy newborn is 40 to 69 mg/dL.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Nursing Care Common to Newborns

288. **Answer: 5**

Weak cry = 1; heart rate of 90 bpm = 1; some flexion of extremities = 1; grimacing = 1; and acrocyanosis = 1.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

289. **4 This is related to neonatal morbidity and mortality; by 5 minutes the healthy neonate is relatively stable with an Apgar score of 8 to 10 and requires routine care.**

**1** The presence of cerebral palsy is not related to the Apgar score. It is rarely diagnosed in the newborn. **2** Genetic defects may or may not be apparent at this time. They are not related to the Apgar score. **3** This has not been proven, although research continues in this area.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Adaptation to Extrauterine Life

290. **Answer: 1, 2, 3.**

**1** Nasal flaring occurs because of the stress of breathing; the flaring nostrils allow more air to enter the respiratory passages. **2** Sternal retractions occur when accessory muscles of respiration contract during the stress of breathing. **3** Grunting respirations occur as the glottis closes and reopens at the height of inhalation; this momentary closure of the glottis increases the length of time oxygen and carbon dioxide are exchanged in the alveoli. **4** Newborns have irregular respirations with periods of apnea. **5** Cyanosis of the hands and feet (acrocyanosis) is typical of all newborns at the time of birth. **6** This is within the expected range for heart rates of healthy infants.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Cardiac Malformations, Data Base

291. **Answer 1, 4, 5.**

**1** This is an important part of record keeping for all newborns. **2** The neonate's Apgar score (7/9) does not indicate a need for oxygen. **3** Newborns are either breastfed or formula fed. Glucose water is not offered first. **4** All newborns are evaluated upon admission to the nursery. **5** All newborns should be kept warm to maintain a stable body temperature.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Nursing Care Common to Newborns

292. **4 If the woman perceives a negative viewpoint about breastfeeding from significant others, she may be tense and the let-down reflex may not occur; a positive attitude from significant others toward breastfeeding promotes relaxation and the let-down reflex.**

**1, 2** This has no influence on lactation. **3** Milk or milk product intake during pregnancy has little influence on lactation.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Breastfeeding, Data Base

**293. 1 The question should be answered directly in the class. However, the mother's statement indicates some concerns about breastfeeding that should be explored privately later.**

**2** This is false reassurance; successful breastfeeding requires mastery, and some women have difficulty. **3** Although the nurse perceives the client's concerns, this response is inappropriate in a class with others present. The nurse should elicit more information privately later. **4** The infant's suckling and emptying of the breasts will determine the amount of milk produced.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Breastfeeding, Nursing Care

**294. 3 Most average-sized infants regulate themselves to an approximate 3- to 4-hour schedule. However, wide variations do exist.**

**1** Some of the episodes of crying do not indicate that the infant is hungry; the mother will learn the difference. **2** It is best to allow the infant to set the schedule. **4** Although this is true, this does not answer the mother's question concerning when she will have free time.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Breastfeeding, Nursing Care

**295. 4 Breastfeeding by a mother with human immunodeficiency virus (HIV) is contraindicated because breast milk can transmit the virus to the infant.**

**1** Breastfeeding by a mother with mastitis is not always contraindicated; during antibiotic treatment lactation can be maintained by pumping the breasts and discarding the milk. When the infection has resolved, breastfeeding can resume. **2** Breastfeeding is not contraindicated with inverted nipples because a breast shield can provide mild suction to help evert a nipple. **3** Breastfeeding is not contraindicated for a client with genital herpes. The newborn may contract the infection during a vaginal birth, not via breast milk.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Breastfeeding, Data Base

**296. 1 Air-drying nipples after feedings limits irritation and disruption of skin integrity.**

**2** Application of soap to breast tissue may result in drying and cracking. **3** Plastic liners trap moisture against tissue and may cause skin breakdown. **4** Wearing a brassiere continuously, except for bathing, is recommended for 2 to 3 weeks to provide support to breast tissue structures.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 27, Breastfeeding, Nursing Care

**297. 3 Frequently the emotional excitement of going home will diminish lactation and/or**

**the let-down reflex for a brief period. When the mother is aware that this may happen and knows how to cope with it, the problem is apt to be a minor one and easily overcome.**

**1** This is false reassurance. Many factors (stresses) inhibit lactation, and the client should be aware of this. **2** This is false reassurance. The milk supply may diminish or stop under stress. **4** This is contraindicated. Lack of breast stimulation during formula feeding could diminish lactation.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Breastfeeding, Nursing Care

**298. 3 Soap irritates, cracks, and dries breasts and nipples, making it painful for the mother when the baby sucks; also, it increases the risk for mastitis.**

**1** The client should empty the breasts at each feeding to keep milk flowing. **2** This is a permissible and often-used technique of breastfeeding. **4** This elicits the rooting reflex, causing the infant's head to turn toward and touch the mother's breast.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 27, Breastfeeding, Nursing Care

**299. 1 More frequent breastfeeding stimulates more frequent evacuation of meconium, thus preventing resorption of bilirubin into the circulatory system.**

**2** Phototherapy is the treatment for hyperbilirubinemia, and it is maintained continuously; it does not prevent the development of hyperbilirubinemia. **3** It is not necessary to formula feed. Early breastfeeding tends to keep the bilirubin level low by stimulating GI activity. **4** Increasing water intake does not limit the development of hyperbilirubinemia because only small amounts of bilirubin are excreted by the kidneys.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Breastfeeding, Data Base

**300. 1 Typically six to eight wet diapers a day indicate adequate fluid intake.**

**2** This may be a sign of inadequate nutritional intake. A breastfeeding infant usually sleeps  $1\frac{1}{2}$  to  $2\frac{1}{2}$  hours between feedings because breast milk digests rapidly. **3** The number of bowel movements per day is not related to the amount of milk ingested, although breastfeeding infants do defecate more frequently than formula-fed infants. **4** The length of nursing time at each breast does not indicate the amount of milk being ingested.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Breastfeeding, Nursing Care

**301. 1 When the breast is pushed into the infant's mouth, a typical response is for the mouth to close too soon, resulting in inadequate latching-on.**

**2** This facilitates latching-on and maintains the infant's head in correct alignment, which promotes sucking and swallowing. **3** This will stimulate the rooting reflex and promote latching-on. **4** This prevents trauma to the nipple when removing the infant from the

breast.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 27, Breastfeeding, Nursing Care

302. **2** Infants require about 73 mL of fluid per pound and 60 calories a day per pound for growth. The infant's weight of 6 lb  $\times$  73 mL of fluid = 438 mL. If fed every 4 hours the infant will have 6 feedings;  $438 \div 6 = 73$  mL;  $73 \div 30$  (30 mL/oz) = 2.4 oz. Therefore, the infant should be offered 2 to 3 oz per feeding.

**1** This amount of formula is inadequate for this newborn. **3, 4** This amount of formula is excessive for this newborn.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 27, Formula Feeding, Nursing Care

303. **4** Cow's milk is more difficult to digest because it is meant to meet a calf's, not an infant's, nutritional needs. It is not recommended until after the infant is 1 year old.

**Formula is preferred if the mother is not breastfeeding.**

**1** Cow's milk contains more protein and more calcium. **2** Cow's milk contains more protein and fewer carbohydrates. **3** Cow's milk contains more calcium.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Formula Feeding; Data Base

304. **Answer: 4, 1, 2, 3, 5.**

**4** The bag should be removed, and the mouth checked for secretions and suctioned, if necessary, to clear the airway. **1** Repositioning the newborn's head may open the airway. **2** Opening the mouth slightly reduces resistance to the positive pressure of the pumped air. **3** Reapplying the mask may create a better seal when the bag is compressed again. **5** After nursing interventions are implemented, the neonate should be reassessed for a response.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 27, Respiratory Distress Syndrome, Nursing Care

305. **1** RhoGAM must be given within 72 hours postpartum if the client has not been sensitized previously, irrespective of the length of the gestation.

**2** It would be useless at this time because antibodies have been produced already. **3** RhoGAM is always indicated at the termination of a pregnancy, even with a short-term pregnancy. **4** RhoGAM is always indicated at the termination of a pregnancy, even with fetal demise.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Hemolytic Disorders, Data Base

306. **4** There is an apparent ABO incompatibility because the mother is O and the infant is B; incompatibility can cause jaundice within the first 24 hours.

**1** The information provided does not indicate neonatal sepsis. **2** Rh incompatibility is not a factor because the mother is Rh positive. **3** Jaundice in the first 24 hours is not

physiologic; it is pathologic.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Hemolytic Disorders, Data Base

**307. 2 The neonate's age is critical because the development of jaundice before 24 to 48 hours after birth may indicate a blood dyscrasia (pathologic jaundice, hyperbilirubinemia), requiring immediate investigation. Jaundice occurring between 48 and 72 hours after birth (physiologic jaundice) is a consequence of the expected breakdown of fetal red cells and immaturity of the liver.**

**1** Unless the jaundice was pathologic (occurring in the first 24 hours of life), this is not necessary. **3** First, the age of the neonate must be ascertained to determine if this is physiologic or pathologic jaundice; then the nurse should obtain a sample of heel blood to determine the serum bilirubin level. **4** Bilirubin studies should be done first to determine whether the serum level warrants phototherapy. This therapy requires a health care provider's order.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Hemolytic Disorders, Data Base

**308. 4 RhoGAM will prevent sensitization from Rh incompatibility that may arise between an Rh-negative mother and an Rh-positive newborn.**

**1** This is unnecessary because only the mother's and infant's Rh factors are relevant. **2** This is unnecessary; if a transfusion were needed, it would be for the newborn, not the mother. **3** There is no incompatibility; incompatibility might occur if the mother were O positive and the newborn had type A, B, or AB blood.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Hemolytic Disorders, Nursing Care

**309. 3 Development of jaundice within the first 24 hours indicates hemolytic disease of the newborn.**

**1** These may or may not be present during the first 24 hours; they are dependent on the bilirubin level. **2** This may or may not be present during the first 24 hours; usually it develops later. **4** Serum bilirubin levels are expected to accumulate in the neonatal period because of the short life span of fetal erythrocytes, reaching levels of 7 mg/100 mL the second to third day when jaundice appears (physiologic jaundice).

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Hemolytic Disorders, Data Base

**310. 2 This is the sign that differentiates between these two conditions; cephalohematoma does not extend beyond the suture line.**

**1** Pain is not associated with either condition. **3** This is unusual; it should decrease in size. **4** Bruising can occur with either condition.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Cranial Birth Injuries, Data Base

**311. 4 A rapid birth does not give the fetal head adequate time for molding; therefore,**

**pressure against the head is increased and blood vessels may burst.**

**1, 3** This results from excessive pulling on the head and shoulders during a difficult birth. **2** This is more likely to occur in a footling breech birth.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 27, Cranial Birth Injuries, Data Base

**312. 4 Intracranial bleeding may occur in the subdural, subarachnoid, or intraventricular spaces of the brain, causing pressure on vital centers; clinical signs are related to the area and degree of cerebral involvement.**

**1** This is caused by hypocalcemia; it is manifested by exaggerated muscular twitching. **2** This is a defect of the spinal column that is observed at birth. **3** An elevated potassium level causes cardiac irregularities, not the irritable behavior observable with CNS involvement.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Cranial Birth Injuries, Nursing Care

**313. 4 With Erb-Duchenne paralysis there is damage to spinal nerves C5 and C6, which causes paralysis of the arm.**

**1** The grasp reflex is intact because the fingers usually are not affected; if C8 is injured, paralysis of the hand results (Klumpke paralysis). **2** There would be a negative Moro reflex only on the affected side. **3** There is no interference with turning of the head; usually injury results from excessive lateral flexion of the head as the shoulder is born.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 27, Neuromusculoskeletal Birth Injuries, Data Base

**314. 3 Gentle massage and manipulation of the arm muscles help prevent contractures. The parents can perform them at home.**

**1** This is dangerous because it may lead to permanent contractures. **2** The length of the arm will not change on a daily basis. **4** Passive range-of-motion exercises should be delayed for 10 days to prevent additional injury to the brachial plexus.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Neuromusculoskeletal Birth Injuries, Nursing Care

**315. 4 The brachial plexus is injured by excessive pressure during a difficult birth or during a vaginal breech birth.**

**1** Erb palsy is an injury that occurs during the birth process; it is not acquired before or after birth. **2** Erb palsy is a birth injury, not a genetic problem. **3** Erb palsy is a birth injury to nervous tissue, not a tumor arising from muscle tissue.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Neuromusculoskeletal Birth Injuries, Data Base

**316. 4 Injury to the brachial plexus, clavicle, or humerus during birth prevents abduction and adduction movements of an upper extremity.**

**1** Children with Down syndrome exhibit the expected Moro reflex. **2** This is not considered a cause; however, if the cochlea were undeveloped or the eighth cranial

(vestibulocochlear) nerve were injured, it would affect equilibrium and response to the test. **3** These injuries usually cause a symmetric loss of the Moro reflex.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Neuromusculoskeletal Birth Injuries, Nursing Care

**317. 3 Opioid withdrawal affects the CNS and respiratory systems.**

**1** These may occur in a newborn with thyroid deficiency. **2** These may indicate that the newborn is experiencing cold stress or respiratory distress. **4** These may occur in a newborn affected with syphilis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Substance Dependence, Nursing Care

**318. 2 As the opioid is cleared from the newborn's body, signs of withdrawal become evident. Tremors, irritability, difficulty sleeping, twitching, and convulsions result.**

**1** Dehydration is secondary to inadequate feeding; it is not a direct result of opioid withdrawal. **3** Muscle hypertonicity, not hypotonicity, occurs. **4** Opioid withdrawal results in signs of excessive stimulation.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Substance Dependence, Nursing Care

**319. 1 This conjunctivitis occurs about 3 to 4 days after birth; if it is not treated prophylactically with an antibiotic at birth or within 3 days, chronic follicular conjunctivitis with conjunctival scarring will occur.**

**2** Human immunodeficiency virus (HIV) in the newborn does not manifest itself with conjunctivitis. **3** High oxygen concentrations given to severely compromised preterm infants cause vasoconstriction of retinal capillaries, which can lead to blindness; there are no data to indicate that this infant was preterm, severely compromised, or received oxygen. **4** This chemical conjunctivitis occurs within the first 48 hours and is not purulent.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Ophthalmia Neonatorum, Data Base

**320. 1 *Chlamydia trachomatis* is associated with the development of pneumonia in the newborn.**

**2** Purulent conjunctivitis at this time suggests a chlamydia infection, not an allergic response. **3** Boric acid solution will not treat this problem; a prescribed antibiotic is required. **4** This would be done eventually; however, the priority is to monitor for signs of pneumonia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Ophthalmia Neonatorum, Data Base

**321. 2 Because physical signs of congenital syphilis are difficult to detect at birth, the infant should be screened immediately to determine if treatment is necessary.**

**1** This is a congenital defect that occurs in the first trimester; *Treponema pallidum* does not affect a fetus before the 16th week of gestation. **3** This is found in children with Down syndrome, not congenital syphilis. **4** This does not manifest in the infant with congenital syphilis until about 3 months of age.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27, Syphilis, Nursing Care

**322. 3 Because neonates are unable to shiver, they use the breakdown of brown fat to supply body heat; the preterm infant has a limited supply of brown fat available for this breakdown.**

**1** This is not specific to preterm neonates; all newborns are unable to use shivering to supply body heat. **2** The breakdown of glycogen into glucose does not supply body heat. **4** Pituitary hormones do not regulate body heat.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Preterm Infant, Data Base

**323. 1 The preterm infant has a reduced glomerular filtration rate and reduced ability to concentrate urine or conserve water.**

**2** All systems of the preterm neonate are less developed than in the full-term neonate. **3** The opposite occurs; urine is very dilute. **4** The fluid and electrolyte balance of preterm infants is easily upset.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Preterm Infant, Data Base

**324. 3 Immaturity of the respiratory tract in preterm infants is evidenced by a lack of functional alveoli, smaller lumina with increased possibility of collapse of the respiratory passages, weakness of respiratory musculature, and insufficient calcification of the bony thorax, leading to respiratory distress.**

**1** This is not a common occurrence at the time of birth unless trauma has occurred. **2** This is not a primary concern unless severe hypoxia occurred during labor; it is difficult to diagnose at this time. **4** This may be a problem, but generally the air passageway is suctioned as needed.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 27, Preterm Infant, Data Base

**325. 4 The moisture provided by the humidity liquefies the tenacious secretions, making gas exchange possible.**

**1** Caloric intake is increased; the amount, number, and type of feedings are related to the metabolic rate. **2** Infants should be positioned side-lying rather than prone; the prone position is associated with apnea and sudden infant death syndrome (SIDS). **3** This is not a routine action; the concentration of oxygen depends on the oxygen concentration of the neonate's blood gases.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 27 Preterm Infant; Nursing Care

---

## UNIT 5

# Child Health Nursing

# Foundations of Child Health Nursing

---

# Growth and Development of the Child

## Principles of Growth

A Differences from adults: continuing physiologic, intellectual, emotional maturation evidenced by developmental milestones

B Influences

1. Physiologic: genetics, nutrition
2. Psychosocial: home and environment, parental attitudes, culture
3. Chronologic and developmental age

C Principles

1. Complex, with all aspects closely related
2. Measured quantitatively and qualitatively over time
3. Continuous and orderly although at uneven rate

D Stages

1. Infancy: most rapid period
2. Preschool to puberty: slower and uniform rate
3. Puberty: second most rapid period (growth spurt)
4. After puberty: decline in rate until death

E Developmental direction

1. Cephalocaudal: from head to toe
2. Proximodistal: from center of body to periphery
3. Different parts of body grow at different rates
  - a. Prenatal: head and brain grow fastest
  - b. First year: elongation of trunk dominates, continued rapid brain growth
4. Sequential; each individual proceeds at own rate

F Critical time: most vulnerable time in development

1. Rapid growth of organs and systems
2. Resolution of psychosocial crises at specific developmental stages

## Characteristics of Growth

### ***Circulatory System***

A Heart rate: decreases with increasing age

1. Birth to 3 months: 100 to 160 beats/min
2. Three months to 2 years: 80 to 150 beats/min
3. Two years to 10 years: 70 to 110 beats/min
4. Preadolescence to adulthood: 55 to 90 beats/min
5. Sites for assessment: apical, femoral, brachial

B Blood pressure: increases with age

1. 50th percentile ranges from 55 to 70 mm Hg diastolic to 100 to 110 mm Hg systolic
2. Levels increase about 2 to 3 mm Hg/year starting at age 7 years
3. Systolic pressure in adolescence: higher in males than females

4. Appropriate size cuff is 45% to 70% of arm width
5. Sites for assessment: lower extremity for younger children; upper extremity for older children

### C Hemoglobin

1. Birth: highest
  - a. 17 g/100 mL of blood; then decreases to 10 to 15 g/100 mL by 1 year
  - b. Fetal hemoglobin (60% to 90% of total hemoglobin) gradually decreases during first year to less than 5%
2. 1 to 12 years: gradual increase to 14.5 g/100 mL
3. After puberty: higher in males than in females

### D Body fluid

1. Total body water (TBW): 80% of body weight at birth; 60%, with small variations, from 1 year of age to maturity
2. Extracellular fluid (ECF): 45% of body weight at birth, 25% at 2 years of age, 20% at maturity
3. Intracellular fluid (ICF): 35% of body weight from birth to 1 year, with small variations; increases to 40% from 5 years of age to maturity

## ***Respiratory System***

### A Respiratory rate: decreases as age increases

1. Infancy: 30 to 40 breaths/min
2. Childhood: 20 to 24 breaths/min
3. Adolescence and adulthood: 16 to 18 breaths/min

### B Vital capacity

1. Gradual increase throughout childhood and adolescence
2. Decreased with obesity; smoking; lung disorders; aging

### C Basal metabolism

1. Newborn: highest rate
2. Rate declines with age
3. After puberty: higher in males than females

## ***Urinary System***

### A Specific gravity

1. Newborn: 1.001 to 1.020; preterm and full-term newborns cannot concentrate urine effectively
2. Other age groups: 1.002 to 1.030

B Glomerular filtration rate: increases rapidly in first 6 months; reaches adult values between 1 and 2 years; gradually decreases after 20 years

## ***Digestive System***

A Stomach size: small at birth; rapidly increases during infancy and childhood

B Peristaltic activity decreases with age

C Blood glucose levels

1. Preterm infants: lower than full-term infants
2. Gradually increase from 75 to 80 mg/100 mL of blood in infancy to 95 to 100 mg/100 mL during adolescence

D Enzymes: present at birth to digest proteins, moderate amount of fat, simple sugars, amylase produced as starch is introduced

E Hydrochloric acid and salivary enzymes: secretion increases with age until adolescence; then decreases with advancing age

## ***Nervous System***

A Brain: 90% of total size by 2 years of age

B Brain cells: all present by end of first year; size and complexity increase with age

C Maturation of brainstem and spinal cord: follows cephalocaudal and proximodistal principles of developmental direction

# Play

## Functions of Play

- A Natural medium for expression, communication, and growth
- B Educational: teaches about physical world; helps to associate names with objects
- C Recreational: helps to release surplus energy
- D Sensorimotor: stimulates muscle development, and tactile, auditory, visual, and kinesthetic senses
- E Social and emotional: aids in learning moral values; helps develop concept of sharing and cooperation with peers
- F Therapeutic: releases tension and stress; encourages manipulation of equipment used for treatment and procedures (e.g., syringe, stethoscope, otoscope, IV bag, incentive spirometer, bandages) to help gain control over threatening events; helpful to have appropriate size doll for “practicing”

## Types of Play

- A Characteristic of developmental level
  1. Infancy: solitary
    - a. Use of senses to explore
    - b. Provides interpersonal contact, recreational and educational stimulation
  2. Toddler: parallel
    - a. Plays alongside, not with, other children
    - b. Less emphasis on exploration using senses
    - c. Imitation is distinguishing characteristic
  3. Preschooler: associative
    - a. Occurs in groups; consists of similar or identical activities without rigid organization or rules
    - b. Cooperative and imitative of life
  4. School age
    - a. Development of groups, teams, cliques; helps develop sense of belonging
    - b. Increased physical skills, intellectual ability, and fantasy

### B Types of play materials

1. Active and physical: push-and-pull toys; riding toys; sports and gym equipment
2. Manipulative, constructive, creative, or scientific: blocks, construction toys, drawing sets, microscope and chemistry sets, books, computer games, collections
3. Imitative, imaginative, and dramatic: dolls, dress-up costumes, puppets
4. Competitive and social: games, role playing

## Suitability of Toys

### *Criteria for Judging Suitability*

## A Safety

1. Infants: should not be given toys with strings or cords 18 cm or longer or furry toys
2. Infants, toddlers, and children who put objects in their mouths: should not be given toys with small parts that may present choking hazards (1.2 inches diameter can occlude airway); should be no smaller than infant's fist
3. Safety labels should designate flame retardant/flame resistant, nontoxic
4. Toys should not be given to children under recommended age

B Compatibility: child's age; level of development; experience

## C Usefulness

1. Challenges child's development; assists to achieve mastery
2. Supports social and personality development; increases motor and sensory skills; develops creativity; helps express emotions
3. Assists understanding of therapeutic procedures (therapeutic play)

# The Family

## Structure of the Family

- A Basic unit of society
- B Composition varies; one member usually recognized as head
- C Usually shares common goals and beliefs
- D Roles change within family and reflect individual's and family's needs
- E Status of members determined by position in family in conjunction with views of society

## Functions of the Family

- A Reproduction
- B Maintenance to provide
  1. Basic needs: clothing, housing, food, health care
  2. Support: social, psychologic, emotional
  3. Protection: immaturity of young children necessitates adult care and supervision
  4. Status: child is member of family that is part of larger community
- C Socialization
  1. Child is acculturated by introduction to social situations; is guided to develop appropriate social behaviors
  2. Self-identity develops through relationships with other family members
  3. Child identifies appropriate sex roles and responsibilities
- D Growth and development of individual members toward maturity and independence

## Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs

- A Recognize that members of family will exhibit a variety of responses (e.g., acute grief and mourning, chronic grief, excessive use of defense mechanisms)
- B Identify stages of chronic grief and parental behavior
  1. Shock and denial
    - a. Learn about problem but deny facts
    - b. Feel inadequate and guilty
    - c. Feel insecure in ability to care for child
    - d. "Shop for doctors" in hope of finding more acceptable answers
  2. Adjustment to special needs
    - a. Feel guilty and self-accuse
    - b. Envy well children (related to bitterness and anger)
    - c. Search for clues or reasons why this happened to them
    - d. Have special feelings toward child that may result in overprotectiveness, gradual acceptance, or rejection

- 3. Reintegration and acknowledgment
  - a. See child's special needs in perspective
  - b. Function more effectively and realistically
  - c. Socially and emotionally accept child
  - d. Reintegrate family life without centering on child
- C Help parents and siblings gain awareness of child's special needs
- D Help parents understand child's potential
  - 1. Assist to set realistic goals
  - 2. Enhance ability to achieve sense of adequacy in parenting by emphasizing appropriate care
  - 3. Teach family how to stimulate child's learning of new skills (e.g., sitting, walking, talking, toileting); keep record of child's progress
  - 4. Teach parents how to help child cope with frustration
- E Encourage parents to treat child equal to other children within family
  - 1. Encourage to set limits, be consistent, avoid overprotection
  - 2. Help to become aware of effects of child on siblings, who may resent excessive attention given to child
- F Provide family with outlet for emotional tensions and needs
  - 1. Explore parental concerns using interviewing techniques (e.g., reflection, paraphrasing, clarification)
  - 2. Acquaint family with organizations, resources, self-help groups
  - 3. Assist siblings, who may fear they have caused their sibling's special need
- G Teach parents importance of continued health supervision
- H Support parents' decisions about extent of health care interventions
- I Evaluate family's responses and revise plan as necessary

# Age-Related Responses to Pain

## Infant

(Table 29-1: FLACC Scale)

Table 29-1  
FLACC Scale

	0	1	2
Face	No particular expression or smile	Occasional grimace or frown, withdrawn, disinterested	Frequent to constant frown, clenched jaw, quivering chin
Legs	Normal position or relaxed	Uneasy, restless, tense	Kicking, or legs drawn up
Activity	Lying quietly, normal position, moves easily	Squirming, shifting back and forth, tense	Arched, rigid, or jerking
Cry	No cry (awake or asleep)	Moans or whimpers, occasional complaint	Crying steadily, screams or sobs, frequent complaints
Consolability	Content, relaxed	Reassured by occasional touching, hugging, or talking to; distractible	Difficult to console or comfort

From Merkel SI, Voepel-Lewis T, Shayevitz JR et al: The FLACC: a behavioral scale for scoring postoperative pain in young children, *Pediatr Nurs* 23:293-297, 1997.

- A Total body response; arms and legs may tremor
- B Facial expressions: grimaces, surprise, frowns, facial flinching
- C Tense, harsh cry
- D Increased blood pressure and heart rate, decreased oxygen saturation

## Toddler

- A Generalized restlessness; guards or rubs painful area
- B Loud crying; uses words to describe pain (e.g., boo-boo, ouch)
- C Tries to delay painful situations

## Preschooler

- A Crying; able to locate pain
- B Regression to earlier stage of development; withdrawal
- C May believe pain is punishment for bad behavior
- D May have been told to be brave and deny pain; fear of injections may contribute to denial of pain
- E May hit or kick caregiver

## School-Age Child

- A Able to describe pain
- B Stiff body posture; withdrawal
- C Afraid of bodily harm; may delay or bargain to avoid painful situations
- D Recognizes death exists

# Adolescent

- A Describes location and intensity of pain
- B Increased muscle tension; decreased activity; withdrawal
- C Understands cause and effect
- D Perceives pain at physical, emotional, and mental levels

## Nursing Care Related to Pain Assessment

- A Use pain rating scales: children's pain is real and must be addressed
- 1. Behavioral scales: used for infants, toddlers, nonverbal children; assess facial expression, leg movement, activity, cry, and consolability (see [Table 29-1: FLACC Scale](#))
- 2. Face scales: used for children age 3 and older; pictures representing facial response to pain progress from "no hurt" to "hurts worst" ([Figure 29-1: Faces Pain Rating Scale](#))

**FIGURE 29-1** Faces Pain Rating Scale. (From Hockenberry M, Wilson D: *Wong's essentials of pediatric nursing*, ed 8, St. Louis, 2009, Mosby.)

- 3. Numerical scales (0 to 10): used for older children and adolescents
- B Address parental concerns about treatment of pain in children
- 1. Explore with parents their perceptions of child's behavioral responses and their concerns
  - a. Fear of addiction: clarify differences between physical dependence, tolerance, and addiction in relation to acute pain
  - b. Fear of respiratory depression: explain pain is natural antidote to respiratory depressant effects of opioids
  - c. Fear of adverse effects of opioids such as constipation: explain side effects are treatable
- 2. Help parents understand physiologic responses do not distinguish between physical responses to pain and other sources of stress to the body

# Principles Related to Medications for Children

## Overview

A Pediatric dosages differ from adult medication dosages as a result of differences in size and physiology

1. Immature liver and kidney function
2. More rapid metabolic rate
3. Lower plasma protein concentration
4. Different body composition: less fat; more fluid

B Most reliable method of calculating dosage is based on body surface area ( $m^2$ ); ensures that child receives correct dose within safe therapeutic range

C Prescribed dosage based on kg of body weight; guideline is manufacturer's recommended daily dose (e.g., mg/kg of body weight)

D IV solutions administered via volume control devices; hourly rate, determined by dividing total volume to be infused by total number of hours for infusion to be completed

## Nursing Care Related to Administration of Medication to Children

A Calculate to determine if prescribed dose is within safe limits

1. Determine amount child should receive (weight in kilograms multiplied by prescribed dose per kilogram)
2. Use ratio and proportion to calculate dose in relation to amount supplied

B Assess developmental level to determine whether suspension or pill form can be used; tablets may be crushed and mixed with half teaspoon of pureed fruit (time-released medications or enteric-coated tablets cannot be crushed)

C Use administration tools to ensure accurate dosage and to minimize loss of medication (e.g., calibrated dropper, needleless syringe, nipple); infusion pumps should be set at milliliters per hour; secure IV site to prevent dislodgment

D Avoid intramuscular administration when an alternative route is available.

E Monitor effectiveness, side effects, hypersensitivity reactions, toxicity

F Administer ear drops

1. Place in side-lying position with affected ear up
2. Age 3 years or younger: pull pinna down and back because eustachian tube is shorter, wider, and straighter than in older children; facilitates passage of fluid to tympanic membrane
3. Past age 3 years: pull pinna up and back

G Allow child to manipulate equipment (e.g., syringe, multidose inhaler); demonstrate use of equipment and assess return demonstration

H Follow procedures for safe administration of medications ([Chapter 2, Basics of Nursing Care Medication Administration, Nursing Responsibilities Related to](#)

Medication Administration)

# CHAPTER 30

# Nursing Care of Infants

---

# Growth and Development

## Developmental Timetable

### ***One Month***

A Physical: first 6 months

1. Weight: gains 150 to 210 g (5 to 7 oz) weekly
2. Height: grows about 2.5 cm (1 inch)/month
3. Head circumference: grows about 1.5 cm ( $\frac{1}{2}$  inch)/month

B Motor

1. Body: flexed position with pelvis high when prone; asymmetric posture (tonic neck reflex)
2. Head
  - a. Held parallel with body in prone position
  - b. Turns from side to side when prone; can lift momentarily from flat surface
3. Reflexes (e.g., grasp, tonic neck, Moro)

C Sensory

1. Eye movements coordinated most of time; follows light to midline
2. Visual acuity 20/100

D Socialization and vocalization

1. Watches face intently during interaction with others
2. Utters small, throaty sounds

### ***Two to Three Months***

A Physical: posterior fontanel closed

B Motor

1. Holds head erect for short time; can raise chest supported on forearms
2. Bears some weight on legs when held in standing position
3. Holds rattle when placed in hand
4. Grasp, tonic neck, and Moro reflexes fading; step or dance reflex disappears
5. Plays with fingers and hands

C Sensory

1. Follows light to periphery
2. Has binocular coordination (vertical and horizontal vision)
3. Listens to sounds

D Socialization and vocalization

1. Smiles in response to person or object; cries less
2. Laughs aloud; shows pleasure in making sounds

### ***Four to Five Months***

A Physical

1. Weight: gains 150 to 210 g/month (5 to 6 oz)

2. Insufficient coordination to swallow saliva

#### B Motor

1. Sits when back is supported; knees flexed and back rounded; balances head
2. Maintains symmetric body position
3. Sustains portion of own weight when held in standing position
4. Reaches for and grasps object with whole hand; misjudges distances
5. Moves own hand or object to mouth at will
6. Rolls over from abdomen to back
7. Lifts head and shoulders at 90-degree angle when prone
8. Early reflexes (e.g., grasp, tonic neck, Moro) have disappeared

#### C Sensory

1. Recognizes familiar objects and people
2. Eyes move together; developing focus to accommodate different distances

#### D Socialization and vocalization

1. Enjoys social interaction; coos and gurgles when given attention
2. Vocalizes displeasure when an object is removed

### **Six to Seven Months**

#### A Physical

1. Weight: doubles birth weight by 6 months
2. Height: grows about 1.25 cm ( $\frac{1}{2}$  inch)/month
3. Head circumference: grows about 0.5 cm ( $\frac{1}{5}$  inch)/month
4. Teething begins with two lower central incisors, followed by upper incisors

#### B Motor

1. Turns over from stomach to back and back to stomach
2. Sits unsupported when placed in forward-leaning position
3. Lifts head when supine as if trying to sit up
4. Approaches toy and grasps it with one hand; can transfer toy from hand to hand and from hand to mouth
5. Plays with feet; puts them in mouth
6. Reflexes

- a. Landau (6 to 8 months to 12 to 24 months): when suspended in horizontal prone position, head is raised, legs and spine are extended
- b. Parachute (7 to 9 months, persists indefinitely): when suspended in horizontal prone position and suddenly thrust forward, hands and fingers extend forward as if to protect from falling

#### C Sensory

1. Has taste preferences; spits out disliked food
2. Develops object permanence: recognizes things are still present even though not seen (e.g., peek-a-boo)

#### D Socialization and vocalization

1. Begins to differentiate between strange and familiar faces; beginning stranger anxiety
2. Makes polysyllabic vowel sounds

3. Vocalizes “m-m-m-m” when crying; cries and laughs at slight provocation

## ***Eight to Nine Months***

### A Motor

1. Sits steadily alone; pulls self to standing position; stands holding onto furniture
2. Develops hand-to-mouth coordination
3. Develops pincer grasp, hand preference
4. Crawls; may go backward at first

### B Sensory

1. Improved depth perception
2. Displays interest in small objects

### C Socialization and vocalization

1. Definite social attachment (e.g., stretches arms toward loved ones); stranger anxiety (e.g., turns or pushes away and cries)
2. Responds to own name; begins separating self from caregiver
3. Reacts to adult anger; cries when scolded
4. Develops imitative and repetitive speech; uses vowels and consonants, (e.g., Mama, Dada); comprehends words such as “bye-bye”

## ***Ten to Twelve Months***

### A Physical

1. Weight: birth weight triples
2. Height: birth length increases by 50%
3. Equal head and chest circumference
4. Teeth: upper and lower lateral incisors; total of six to eight

### B Motor

1. Creeps (abdomen supported off floor)
2. Stands alone for short time; walks with help; moves around by holding onto furniture (cruising)
3. Sits down from standing position without help
4. Eats from spoon; drinks from cup with help; prefers using fingers
5. Plays “pat-a-cake” and “peek-a-boo”; holds crayon to mark paper
6. Helps with dressing (e.g., putting arm through sleeve)

### C Sensory

1. Visual acuity 20/50; amblyopia (lazy eye) may develop
2. Discriminates simple geometric forms

### D Socialization and vocalization

1. Exhibits emotions (e.g., jealousy, affection, anger)
2. Enjoys familiar surroundings; explores away from caregiver
3. Fearful in strange situations or with strangers; clings to caregiver
4. May develop attachment to “security” object
5. Can say two meaningful words besides Dada or Mama; understands simple verbal

requests, such as “Give it to me”

# Health Promotion of Infants

## Play

A Narcissistic: revolves around own body

B Responses: global, undifferentiated

C Dependent; progresses to interdependent, then independent

D Directed toward physical, motor, sensory, language, cognitive, and personal-social development

E Purpose of toys

1. Promote physical development

2. Provide visual, auditory, tactile, and kinetic stimulation

F Suggested toys: should be simple because of short attention span (e.g., rattles; soft, stuffed toys; mobiles; push-pull toys; simple musical toys; unbreakable mirrors; weighted or suction toys; squeeze toys; teething toys; books with textures; activity boxes; nested boxes; fitting forms)

## Nutrition during Infancy

### *Nutrition in Relation to Growth and Development*

A Growth

1. During first year: should be charted to evaluate proportional gain in length, weight, and head circumference; overweight and underweight indicate malnutrition

2. Growth charts

a. Demonstrate percentile of child's growth (below 5th and above 95th percentile are outside expected range)

b. Placement on growth curves determines if deviations exist from steady state of growth

B Development

1. Optimum nutrition and establishment of appropriate eating habits essential for growth and development

2. Diet should provide nutritional requirements for age and prevent obesity

3. Gastrointestinal disturbances (e.g., vomiting, diarrhea, constipation) interfere with optimum nutrition despite adequate diet

4. Consistency of foods: progress from liquid to semisoft, to soft, to solids as dentition and jaw develop

### *Feeding Milestones*

A Birth: full-term infant has sucking, rooting, and swallowing reflexes

B Newborn: feels hunger; indicates desire for food by crying; expresses satiety by falling asleep

C One month: has strong extrusion reflex

D Five to 6 months: uses fingers to eat

- E Six to 7 months: chews solids
- F Eight to 9 months: holds spoon; plays with it during feeding
- G Nine months: holds bottle
- H Twelve months: drinks from cup; bottle preferred at times (bedtime)

## ***Guidelines for Infant Nutrition***

A Breast milk or iron-fortified commercial formula recommended for first year of life; American Academy of Pediatrics states iron-fortified commercial formula is acceptable but not preferred alternative to breastfeeding

B Breast milk: most complete diet for first 6 month; may require supplementation

1. Iron supplement: needed by 4 to 6 months
2. Fluoride supplementation: determined by fluoride content of water supply; started between six months and three years; American Academy of Pediatrics and American Dental Association do not recommend fluoride supplementation for first 6 months of life; fluoride supplementation is controversial, but continues to be recommended
3. Vitamin D supplementation: for infants of mothers who are vitamin D deficient or not exposed to adequate sunlight

C Whole cow's milk: should not be introduced until after 1 year of age; difficult to digest; inadequate in iron, vitamin C, and other essential nutrients

D Solid foods

1. Infant cereals: first solid food introduced at about 6 months; should be iron-fortified; rice cereal has low allergenic potential; should be continued until 18 months of age
2. Order of introduction varies; vegetables and/or fruits first, then meats; should be strained, puréed, or mashed
3. Finger foods: introduced at 6 to 7 months (e.g., toast, teething cracker, raw fruit)
4. Chopped table food or commercially prepared junior foods: started at 9 to 12 months

E Fruit juices: should be offered from cup early to prevent dental caries; can be substituted for milk for one feeding each day

F Method for introducing solid foods

1. Feed several sucks of breast milk or formula when hungry, and then offer solid food
2. Introduce one food at a time, usually at intervals of 4 to 7 days, to allow for identification of food allergies
3. Begin spoon feeding by placing food on back of tongue because of tendency to thrust tongue forward (extrusion reflex begins to fade by 3 to 4 months)
4. Use small spoon with straight handle; begin with 1 or 2 teaspoons; gradually increase to several tablespoons per feeding
5. Increase amount of solid food; decrease milk intake to about 900 mL (30 oz) daily; prevent overfeeding
6. Avoid mixing solid foods with formula and bottle feeding the mixture

G Weaning

1. Psychologically significant; requires relinquishing major source of pleasure
2. Readiness: after 6 months; experiences pleasure from spoon feeding (e.g., desire for more freedom, control over body and environment)

3. Gradual replacement of 1 bottle at a time with cup; nighttime bottle last to be relinquished
4. Termination of breastfeeding
  - a. Before 6 months of age: formula feeding continued to meet sucking needs
  - b. After 6 months of age: liquid offered in a cup

## Immunizations

A Types of immunizations that provide active immunity; see [Chapter 3](#), Integral Aspects of Nursing Care, Infection, Review of Physiology (Immunity), for [Figure 3-2 A, B, and C](#) (Recommended Immunization Schedules—United States 2011)

1. Hepatitis B vaccine (Hep B)
  - a. Three doses (at birth to 1 month, 2 months, and between 6 and 18 months); for all adolescents not immunized; for health care providers because of risk of transmission via needle sticks or exposure to blood
  - b. Administration
    - (1) IM injection: can be given at same time as diphtheria, tetanus, acellular pertussis (DTaP), using separate sites
    - (2) Sites: vastus lateralis for infants; deltoid muscles for older infants and children; dorsogluteal site not used because of proximity to nerves and blood vessels
2. Hepatitis A vaccine (Hep A)
  - a. Two doses (at least 6 months apart between 12 and 24 months)
  - b. Recommended for children 1 year of age and older
3. Diphtheria, tetanus, acellular pertussis (DTaP)
  - a. Three doses (at 2, 4, and 6 months); fourth dose between 12 and 18 months; booster dose at 4 to 6 years of age
  - b. Diphtheria toxoid: effective for about 10 years; febrile reaction more common in older children
  - c. Tetanus toxoid: nearly 100% effective; induces immunity for about 10 years; given at 5-year intervals if there is possibility of contaminated wound
  - d. Tetanus and diphtheria (Td) toxoid: for adults; recommended every 10 years after last booster (at about 5 years of age); administered to children older than age 7 years not previously immunized
  - e. Pertussis vaccine: passive immunity not acquired from mother; not given after age 7 years because incidence of disease poses less risk than vaccine's side effects
4. Inactivated polio vaccine (IPV)
  - a. Three doses (at 2, 4, and 6 to 18 months); fourth dose between 4 and 6 years of age
  - b. Recommended for all children younger than 18 years of age
  - c. Intramuscular route preferred in United States
  - d. Oral polio vaccine (OPV) used for worldwide immunization; rate of polio is now 1 in 2.4 million people
  - e. Administered to infants/children who are asymptomatic HIV-positive or those

with immune deficiencies and their siblings

5. *Haemophilus influenzae* type b vaccine (Hib)
  - a. Four doses (three doses at 2, 4, and 6 months of age; one dose between 12 and 15 months)
  - b. Some formulations do not require a dose at 6 months if doses were received at 2 and 4 months of age
6. Rotavirus vaccine (RV)
  - a. Three doses (at 2, 4, and 6 months of age)
  - b. Can be administered at same time as other vaccines
7. Pneumococcal vaccine (PCV)
  - a. Four doses (3 doses at 2, 4, and 6 months of age; one dose between 12 and 15 months)
  - b. High-risk children receive additional dose between 2 and 6 years of age
8. Chickenpox (Varicella) vaccine
  - a. First dose at minimum of 12 months of age; second dose between 4 and 6 years of age; second dose before 4 years if at least 3 months have elapsed between the first and second dose
  - b. Two doses at least 28 days apart for children 13 years of age and older who never had chickenpox or received chickenpox vaccine
  - c. Side effects: malaise; pruritic rash that begins on abdomen, progresses to face and proximal extremities
9. Measles (rubeola), mumps, and rubella (German measles) vaccine (MMR); live, attenuated vaccine
  - a. Acquired natural immunity from mother for first 12 to 15 months of age
  - b. First dose at minimum of 12 months of age; second dose between 4 and 6 years of age (can be administered earlier if more than 28 days have elapsed since last dose)
  - c. Rubella vaccine: administered to women not previously immunized during preconception counseling or postpartum; causes a maculopapular rash

## B Factors influencing administration of immunizations

1. Benefit from being protected by immunization outweighs risk from contracting disease
2. Maternal antibodies acquired in utero from placenta provide passive immunity for first several weeks of life; antibodies acquired from breastfeeding mother after birth provide infant with immunity against most viral, bacterial, and fungal infections during infancy
3. Contraindications
  - a. Administration of blood transfusion or immune serum globulin that provide passive immunity; MMR and varicella vaccine postponed for 3 months
  - b. High fever, serious illness; common cold not a contraindication
  - c. Impaired immune system or immunosuppressive therapy in child or family member
  - d. Systemic malignancy (e.g., leukemia)
  - e. Neurologic problems (e.g., seizures)

- f. Allergic reaction to previously administered vaccine or anaphylactic reaction to egg protein

## Injury Prevention during Infancy

A Accidents are a leading cause of death

1. Mechanical suffocation
2. Aspiration of small objects (6 to 12 months)
3. Ingestion of poisonous substances (6 to 12 months)
4. Falls, rolling off elevated surfaces, tumbling down stairs

B Teaching prevention

1. Birth to 4 months

- a. Sudden infant death: place on back; avoid soft, moldable bedding (e.g., pillows, quilts)

b. Suffocation

- (1) Avoid using plastic bags, plastic covers for mattress
- (2) Use firm mattress that fits snugly in crib; avoid using pillows, loose blankets
- (3) Provide sleeping enclosure in which infant sleeps alone
- (4) Ensure crib and carriage designs meet regulations; use carrying slings cautiously
- (5) Keep crib and infant seat away from window blinds and cords
- (6) Offer one-piece pacifiers; avoid tying pacifier to a string, remove bibs after use
- (7) Never leave alone in bath (danger of drowning)

c. Falls

- (1) Always raise crib rails
- (2) Never leave on raised, unguarded surface
- (3) Restrain in infant seat; never leave unattended while seat is on raised surface
- (4) Avoid using high chair until old enough to sit unsupported

d. Burns

- (1) Set household hot water heater at temperature lower than 120° F
- (2) Check temperatures of bathwater and warmed formula in advance
- (3) Avoid pouring hot liquids nearby when infant is nearby or sitting on lap
- (4) Keep cigarettes and ashes at a distance; do not allow smoking in home
- (5) Keep in sun for no more than several minutes; use hats and apply sunscreen
- (6) Use flame-retardant clothes and wash according to label directions
- (7) Check surface heat of car restraint; do not leave in car unattended

e. Motor vehicles

- (1) Transport in regulation three- to five-point harness rear-facing infant carrier in back seat of car; anchor via seat belt

(2) Secure car seat in back seat of car facing rear until 1 year of age or weighs at least 20 pounds; when older place in convertible seat, strapped in back seat of car

(3) Do not place carriage or stroller behind parked car

f. Environment: keep sharp, jagged-edged objects away from infant's vicinity

## 2. Four to 7 months

### a. Aspiration

(1) Keep buttons, beads, and other small objects out of reach; keep floor free of small objects; inspect toys for removable parts

(2) Offer pacifiers with one-piece construction and loop handle

(3) Do not feed infant hard candy, nuts, food with pits or seeds, or whole hot dogs; cut foods, such as hot dogs, into small irregularly shaped pieces

(4) Do not offer balloons or fuzzy toys

b. Suffocation: see birth to 4 months

c. Falls: restrain in high chair; keep crib rails raised to full height

### d. Poisoning

(1) Verify that paint for furniture or toys is lead free

(2) Place toxic substances on high shelf and/or in locked cabinet; store toxic substances in original containers; avoid storing large quantities of cleaning fluids, paints, pesticides, and other toxic substances; discard used containers of poisonous substances

(3) Place purses/backpacks out of reach

(4) Hang plants or place on high surface out of reach

(5) Know national toll-free telephone number of Poison Control Center (800-222-1222)

e. Burns: see birth to 4 months

f. Motor vehicles: see birth to 4 months

g. Environment: offer toys that are smooth and rounded, made of wood or plastic; do not allow long, pointed objects as toys

## 3. Eight to 12 months

a. Aspiration: see 4 to 7 months

### b. Suffocation/drowning

(1) Keep doors of bathrooms, ovens, dishwashers, refrigerators, clothes washers and dryers closed at all times

(2) Remove doors if storing or discarding appliances (e.g., refrigerator, dishwasher)

(3) Fence in swimming pools; always supervise when near any source of water (e.g., toilets, filled bathtubs, cleaning buckets)

c. Falls: fence stairways at top and bottom if there is access to either end

### d. Poisoning

(1) Administer medications as drug, not candy

(2) Do not administer adult medications unless prescribed

(3) Replace caps to medications and toxic substances immediately after use;

- use child protector caps
- (4) Store hazardous materials in locked cabinets or out of reach (e.g., medications, cleaning supplies, paint)

e. Burns

- (1) Place guards in front of heating appliances, fireplace, or furnace
- (2) Keep electrical wires hidden or out of reach; do not allow play with electrical appliances
- (3) Use plastic guards in electrical outlets; place furniture in front of outlets
- (4) Keep pot handles on stove out of reach
- (5) Avoid using overhanging tablecloths

f. Motor vehicles

- (1) Use three- to five-point restraint regulation car seat that is held in place with seat belt
- (2) Fence in yard if it is area for playing

g. Environment

- (1) Use plastic cups or dishes for infant self-feeding
- (2) Check safety of toys and toy box
- (3) Protect from animals, especially dogs

# Hospitalization of Infants

## ***Data Base***

A Reactions to parental separation begin in later months (see [Chapter 31](#), Nursing Care of Toddlers, Hospitalization of Toddlers); reactions to procedures begin later (see [Chapter 32](#), Nursing Care of Preschoolers, Hospitalization of Preschoolers)

B Pain, although felt, is not localized; requires appropriate analgesia and sedation for painful procedures

## **General Nursing Care of Infants**

A Assess physical, physiologic, and behavioral responses (see [Chapter 29](#), Foundations of Child Health Nursing, Age-Related Responses to Pain, Nursing Care Related to Pain Assessment, [Table 29-1](#), [FLACC Scale])

B Meet physical and emotional needs immediately to support development of trust

C Provide nonnutritive sucking to meet oral needs

D Encourage significant others to stay for comfort and support, especially after 5 months

E Provide same caregivers for consistency

# Health Problems That Begin in Infancy and May Persist through Childhood (Nursing care includes care of the infant and child)

## Fetal Alcohol Spectrum Disorders (FASD)

### **Data Base**

- A Fetal/newborn responses to alcohol consumption during pregnancy
- B Range of lifelong disorders; fetal alcohol syndrome (FAS) most severe form of FASD
- C Incidence: approximately 0.5 to 2 per 1000 live births

### D Prevention

1. Complete abstinence during pregnancy and if planning pregnancy
2. Instruction
  - a. Recognition of risks if there is history of heavy drinking
  - b. Awareness of treatment sources or self-help groups to decrease or eliminate alcohol ingestion

### E Clinical findings

1. Unusual facial features (e.g., smooth ridge between nose and upper lip [hypoplastic philtrum], receding chin [hypoplastic maxilla])
2. Small head size; lower-than-average height, weight, or both
3. Central nervous system (CNS) problems (e.g., impaired coordination, learning, memory, attention span, communication, vision, or hearing; hyperactivity; difficulties in school and with interpersonal relationships; may include more than one problem)

### F Therapeutic interventions

1. Pharmacologic management depending on clinical findings
2. Reduction of noxious environmental stimuli
3. Encouragement to achieve self-regulation
4. Provision of IV fluids and nutrients until able to maintain feedings
5. Therapy specific to individualized needs; may be similar to needs of preterm infants

### **Nursing Care of Alcohol-Exposed Infants**

### **Assessment/Analysis**

1. Mother's prenatal record indicating alcohol use
2. Developmental level; growth deficiencies
3. Feeding difficulties
4. CNS problems
5. Distinctive craniofacial characteristics
6. Behaviors related to neonatal abstinence syndrome

### **Planning/Implementation**

1. Monitor vital signs
2. Observe for signs of withdrawal
  - a. Usually within 6 to 12 hours after birth; persist for about 3 days
  - b. Assess for clinical manifestations related to CNS, GI, respiratory, autonomic nervous system alterations
  - c. Monitor for seizure activity; protect from injury during seizure
3. Maintain protective environment
  - a. Limit environmental stimuli; keep in quiet, dimly lit room
  - b. Keep warm
  - c. Touch gently; avoid sudden positional changes
  - d. Have suctioning equipment available
4. Institute comfort measures
  - a. Use containment devices or swaddle with extremities in flexed position
  - b. Allow hand-to-mouth activity to promote self-soothing
  - c. Provide pacifier for nonnutritive sucking
  - d. Offer safe objects for play
5. Provide fluid and nutrients
  - a. Allow extra time for feedings
  - b. Offer frequent, small feedings
  - c. Burp often during feedings
  - d. Elevate head of mattress after feedings
  - e. Teach parents techniques to enhance adequate intake
6. Support parents
  - a. Reinforce positive parenting activities
  - b. Encourage to seek follow-up care, early treatment, and therapy to prevent long-term disabilities

## **Evaluation/Outcomes**

1. Remains free from injury
2. Exhibits resolution of withdrawal
3. Demonstrates ingestion and retention of adequate nutrients
4. Has consistent weight gain
5. Parents demonstrate effective infant care
6. Parents continue follow-up care

## **Chromosomal Aberrations**

### ***General Nursing Care of Children with Chromosomal Aberrations***

## **Assessment/Analysis**

1. Presence of chromosomal anomaly
2. Parental perceptions of infant

3. Health status: functional limitations; other congenital anomalies (e.g., cardiac malformation)

## Planning/Implementation

1. Provide emotional support to parents
2. Assist parents in setting realistic expectations and goals
3. Refer for testing of intellectual functioning (See [Chapter 31](#), Nursing Care of Toddlers, Nursing Care of Children Who Are Cognitively Impaired)
4. Provide specific care for associated congenital malformations
5. Encourage genetic counseling appropriate for type of problem

## Evaluation/Outcomes

1. Breathes without difficulty
2. Maximizes growth and development potential
3. Communicates needs, feelings, and concerns
4. Demonstrates behavior indicative of positive self-esteem

## Trisomy 21 (Down Syndrome)

### **Data Base**

#### A Types

1. Free trisomy 21: associated with advanced maternal age (older than age 40); can occur in all age groups
2. Translocation 15/21: transmitted most often by mother, who is carrier; not age related
3. Mosaicism: mixture of healthy cells and cells that are trisomic for 21; similar developmental outcome as those with trisomy 21

#### B Clinical findings

1. Head: brachycephaly, flat occiput
  - a. Nose: depressed bridge (saddle nose)
  - b. Eyes: inner epicanthic folds; slanted eyes (oblique palpebral fissure); speckling of iris (Brushfield spots)
  - c. Ears: small, usually low set
  - d. Neck: short, thick
  - e. Tongue: protruding, sometimes fissured
2. Muscles: hypotonic (e.g., protruding abdomen, umbilical hernia); hyperflexible with lax joints
3. Hands and feet: broad, short, stubby; one transverse palmar crease
4. Sexual development: delayed; incomplete (men usually infertile)
5. Associated problems: cardiac malformation, respiratory difficulty, obesity

### **Nursing Care of Children with Trisomy 21**

(See [General Nursing Care of Children with Chromosomal Aberrations](#))

- A Prevent infection, especially respiratory
- B Assess and monitor cardiac status
- C Provide activity consistent with abilities and limits
- D Provide for physical supervision and habilitation

## Trisomy 18 (Edwards Syndrome)

### **Data Base**

- A Types: trisomy; translocation; mosaicism
- B Clinical findings
  1. Deformed, low-set ears; small jaws (especially lower jaw [micrognathia]); rocker-bottom feet; prominent occiput; webbed neck; short digits
  2. Failure to thrive; short survival; if surviving, severe mental retardation

### **Nursing Care of Children with Trisomy 18**

- A Prepare parents for uncertainty of life span; fewer than 10% survive to first birthday; some survive up to age 20
- B Support grieving parents  
(See [General Nursing Care of Children with Chromosomal Aberrations](#))

## Turner Syndrome (Gonadal Dysgenesis)

### **Data Base**

- A Chromosome monosomy (XO karyotype) in females
- B Clinical findings
  1. Congenital malformations: short stature, webbed neck, coarctation of aorta, ovarian dysgenesis; developmental failure of secondary sex characteristics at puberty
  2. CNS: average intelligence; problems in directional sense, space-form recognition

### **Nursing Care of Children with Turner Syndrome**

- A Refer parents for genetic counseling if planning another pregnancy
- B Prepare parents and child for lack of pubertal changes, need for hormonal replacement  
(See [General Nursing Care of Children with Chromosomal Aberrations](#))

## Klinefelter Syndrome

### **Data Base**

- A Sex-chromosomal abnormality of XXY in males
- B Clinical findings
  1. Physical characteristics: slightly taller than average; long legs and arms; small, firm testes; gynecomastia; inadequately developed secondary sex characteristics
  2. Average to borderline intelligence

## ***Nursing Care of Children with Klinefelter Syndrome***

A Refer parents for genetic counseling if planning another pregnancy

B Explain that emotional problems may require lifelong counseling

(See [General Nursing Care of Children with Chromosomal Aberrations](#))

# Gastrointestinal Malformations

## Cleft Lip and Cleft Palate

### Data Base

A Incomplete fusion of embryonic structures surrounding primitive oral cavity (cleft lip)  
B Failure of primary and secondary palatine plates to fuse (cleft palate) (Figure 30-1:  
Variations in clefts of lip and palate at birth)

**FIGURE 30-1** Variations in clefts of lip and palate at birth. **A**, Notch in vermilion border. **B**, Unilateral cleft lip and cleft palate. **C**, Bilateral cleft lip and cleft palate. **D**, Cleft palate. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

1. Cleft lip: incomplete fusion of maxillary and premaxillary processes; should be completed between 5 and 8 weeks' gestation; more common in males
2. Cleft palate: incomplete fusion of palatal structures; may involve soft or hard palate; may extend into nose, forming oronasal passageway; fusion completed between 9 and 12 weeks' gestation; more common in females
3. Cleft lip and palate often occur together

### C Etiology unknown

1. Evidence of hereditary influence
  - a. Multifactorial inheritance; increased frequency in relatives
  - b. Higher incidence in monozygotic twins than in dizygotic twins
2. Risk factors
  - a. Folic acid deficiency during pregnancy
  - b. Prenatal exposure to toxic substances (e.g., phenytoin, valproic acid, thalidomide; tobacco, alcohol)

### D Occurs with other congenital anomalies

### E Classification

1. Bilateral or unilateral; if unilateral, more common on left side
2. Cleft lip: several degrees; complete cleft usually continuous with cleft palate

### F Related difficulties

1. Cleft lip
  - a. Difficult feeding; cannot form vacuum with mouth to suck; may be able to breastfeed (breast may fill cleft, making sucking easier)
  - b. Requires special feeding devices (e.g., Cleft Lip/Cleft Palate Nurser, Medela Haberman feeders, Pigeon bottle)

c. Mouth breathing dries mucous membranes, predisposing to infection

## 2. Cleft palate

- a. Prone to infection, especially otitis media
- b. Altered speech; complete palate needed to trap air in mouth
- c. Malposition of teeth and maxillary arch; extensive orthodontic and prosthodontics needed
- d. Hearing problems caused by recurrent otitis media (eustachian tube connects nasopharynx and middle ear, transports pathogens to ear)
- e. Requires special feeding devices similar to those used for cleft lip

## G Therapeutic intervention

1. Surgical repair: may require multiple surgeries throughout childhood
  - a. Cleft lip: repaired in first days after birth; further modification may be necessary; aids ability to suck; helps parents cope by modifying visible aspects of defect
  - b. Cleft palate: surgical intervention and repair as early as neonatal period but not later than between 12 and 18 months; done before speech is fully developed
2. Multidisciplinary team approach: pediatric plastic surgeons, orthodontists, otolaryngologists, speech and language therapists, audiologists, nurses, social workers
3. Cleft palate: temporary or permanent dental prostheses to replace missing teeth; devices applied to mechanically close cleft until ready for surgical closure

## ***Nursing Care of Children with Cleft Lip/Cleft Palate***

### **Assessment/Analysis**

1. Feeding behaviors; consumption of adequate calories for growth without excessive energy expenditure; need for oral hygiene
2. Mucous membranes for dryness, signs of infection
3. Parent/infant interaction; effect of facial defect on attachment
4. Cleft palate: respiratory status, hearing ability

### **Planning/Implementation**

1. Preoperative care
  - a. Feed in upright position to prevent aspiration; use adaptive feeding device; encourage breastfeeding
  - b. Feed slowly, burp frequently because of swallowed air
  - c. Perform meticulous oral hygiene to prevent infection
  - d. Teach parents how to perform oral/dental hygiene
  - e. Encourage continued dental supervision
2. Postoperative nursing care for cleft lip
  - a. Maintain patent airway because of edema and mouth breathing; keep oral suction equipment available
  - b. Cleanse suture line to prevent crust formation and scarring
  - c. Minimize crying to prevent pressure on suture line; encourage a parent to stay

with child

- d. Use pain rating scale and medicate appropriately
- e. Place in supine position with arm or elbow restraints; change position to side or sitting up to prevent hypostatic pneumonia; remove restraints when supervised
- f. Feed (see preoperative care)
- g. Support parents during healing process

3. Postoperative nursing care for cleft palate

- a. Avoid traumatizing operative site; tell child who can follow directions not to rub tongue on roof of mouth; avoid offering straw, spoon, toothbrush
- b. Use pain rating scale and medicate appropriately
- c. Provide liquid or blenderized diet
- d. Provide emotional support for parents; prolonged recovery

4. See [Chapter 29](#), Foundations of Child Health Nursing, Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs

## Evaluation/Outcomes

1. Maintains integrity of suture line
2. Operative site heals completely
3. Experiences minimal or no pain
4. Consumes adequate calories for growth and development
5. Demonstrates ability to be comforted by means other than sucking
6. Family members accept infant regardless of appearance

## Nasopharyngeal and Tracheoesophageal Anomalies

### Data Base

A Failure of esophagus to develop continuous passage to stomach; failure of trachea and esophagus to develop into separate structures

B Risk factors: low birth weight; about 50% associated with other anomalies (e.g., vertebral anomalies, imperforate anus, radial and renal dysplasia, limb anomalies, cardiac malformations)

C Tracheopharyngeal anomalies

1. Absence of esophagus
2. Atresia of esophagus without tracheal fistula
3. Tracheoesophageal fistula
4. Most common: proximal esophageal atresia combined with distal tracheoesophageal fistula

D Other associated anomalies

1. Chalasias: incompetent cardiac sphincter
2. Choanal atresia: no opening between one or both nasal passages and nasopharynx

E Clinical findings

1. Excessive salivation, drooling

2. Choking, sneezing, coughing during feeding, regurgitation of formula through mouth and nose
  3. Catheter cannot be passed into stomach (depending on type)
  4. Abdominal distention (depending on type)
- F Therapeutic intervention: surgical repair; one procedure or several, depending on health status and severity of defect

## ***Nursing Care of Children with Nasopharyngeal and Tracheoesophageal Anomalies***

### **Assessment/Analysis**

1. Three Cs indicating tracheoesophageal fistula: Coughing, Choking, Cyanosis
2. Signs of respiratory distress
3. Nutritional status/weight
4. Fluid and electrolyte balance
5. Parent/infant interaction

### **Planning/Implementation**

1. Preoperative nursing care
  - a. Observe for signs of respiratory distress; suction oropharynx to remove accumulated secretions
  - b. Keep NPO; monitor intake and output; offer pacifier to meet sucking needs
  - c. Change position to prevent pneumonia
  - d. Maintain with head elevated on inclined plane of at least 30 degrees
  - e. Maintain patency of nasogastric tube if used to decompress stomach
2. Postoperative nursing care
  - a. Maintain body temperature
  - b. Maintain nasogastric/gastrostomy tube to drainage
  - c. Change position to prevent pneumonia
  - d. Maintain function of chest tubes, if used
  - e. Maintain nutrition by oral, parenteral, or gastrostomy route
  - f. Use pain rating scale and medicate appropriately
  - g. Provide comfort and physical contact; provide a pacifier for nonnutritive sucking until oral feedings are resumed

### **Evaluation/Outcomes**

1. Maintains patent airway
2. Tolerates oral feedings
3. Consumes adequate calories for growth and development

## **Hypertrophic Pyloric Stenosis (HPS)**

## **Data Base**

A Thickened circular muscle of pylorus; occurs within first weeks of life

1. Narrow opening between stomach and duodenum
2. Obstruction from inflammation and edema
3. Compensatory dilation, hypertrophy, and hyperperistalsis of stomach
4. May be isolated disorder; may be associated with intestinal malrotation, esophageal and duodenal atresia, anorectal anomalies

B Incidence

1. Polygenic inheritance
2. Five times more common in males
3. More common in firstborn and in offspring of affected persons

C Clinical findings

1. Palpable olive-shaped mass in right upper quadrant
  2. Vomiting: not bile-stained; progressively projectile
  3. Dehydration; weight loss; failure to thrive; electrolyte and acid-base imbalances
  4. Constipation; distended epigastrium
  5. Obstruction within 4 to 6 weeks: visible peristaltic waves across abdomen; colicky pain
- D Therapeutic intervention: surgical repair

## ***Nursing Care of Children with Hypertrophic Pyloric Stenosis***

### **Assessment/Analysis**

1. Feeding history; type of vomiting; failure to gain weight; dehydration
2. Upper abdomen for distention; epigastrium just to right of umbilicus for palpable olive-shaped mass
3. Visible peristaltic waves
4. Baseline weight for comparison
5. Evidence of pain or discomfort

### **Planning/Implementation**

1. Preoperative nursing care
  - a. Maintain NPO
  - b. Obtain vital signs
  - c. Monitor intake and output
  - d. Monitor for signs of dehydration; metabolic alkalosis; other fluid and electrolyte imbalances
2. Postoperative nursing care
  - a. Maintain NPO if ordered
  - b. Monitor IV fluid, electrolytes, weight
  - c. Offer prescribed water, glucose, or electrolyte solution for first feeding; progress to half-strength formula/breast milk and then to full-strength formula/breast milk, usually within 24 hours

3. Teach parents specific feeding method
  - a. Give small, frequent feedings; feed slowly
  - b. Hold in upright position during feeding; after feeding place in infant seat or on right side with head of bed elevated
  - c. Burp frequently during feeding; avoid handling afterward

## Evaluation/Outcomes

1. Maintains fluid and electrolyte balance
2. Rests comfortably
3. Consumes adequate calories for growth and development

## Intestinal Obstruction

### **Data Base**

A Congenital life-threatening obstruction of intestinal tract

1. Mechanical: constricted or occluded lumen (e.g., incarcerated inguinal hernia progressing to strangulated with interruption of blood supply; intussusception; volvulus)
2. Muscular: interference with regular muscular contractions

B Clinical findings

1. Abdominal distention, paroxysmal pain
2. Absence of stools, meconium in newborn (meconium ileus)
3. Vomiting of feeding progressing to bile-stained material, may be projectile
4. Weak, thready pulse; cyanosis; weak, grunting respirations from abdominal distention, causing diaphragm to compress lungs

C Therapeutic interventions

1. Surgical repair: single-staged; multistaged for severe defect
2. Prevention of aspiration pneumonia
3. Supportive nutritional therapy

### **Nursing Care of Children with an Intestinal Obstruction**

## Assessment/Analysis

1. Abdomen for distention, visible peristaltic waves
2. Characteristics and amount of vomitus
3. Absence or presence of bowel sounds, bowel movements; characteristics of stool

## Planning/Implementation

1. Preoperative nursing care
  - a. Maintain NPO; provide pacifier
  - b. Observe for signs of dehydration and shock
  - c. Maintain nasogastric suction; monitor I&O

2. Postoperative nursing care based on type of surgery performed
  - a. Keep operative site clean and dry, especially after passage of stool
  - b. Position on side to prevent pulling legs up to chest
  - c. Use pain rating scale and medicate appropriately
  - d. Provide colostomy care
    - (1) Prevent skin excoriation by frequent cleansing; apply skin protective agent, diaper, or ostomy appliance
    - (2) Teach parents colostomy care (e.g., avoidance of tight diapers and clothes around abdomen)

## Evaluation/Outcomes

1. Establishes regular pattern of bowel elimination
2. Maintains fluid and electrolyte balance
3. Consumes adequate nutrition to support growth
4. Rests comfortably

## Anorectal Anomalies (Imperforate Anus)

### **Data Base**

A Failure of membrane separating rectum from anus to absorb during eighth week of fetal life; range from simple (imperforate anus only) to complex (genitourinary and pelvic organs involved); most common anorectal congenital malformation

### B Types

1. Imperforate anus: may include fistula from distal rectum to perineum, urinary system, or reproductive system
2. Rectal atresia and stenosis: midline intergluteal groove without fistula, limits or prevents defecation despite anal opening
3. Persistent cloaca: rectum, vagina, urethra open into common lumen in perineum, feces and urine empty through urethral opening

### C Classification according to gender

1. Male: perineal, rectourethral, bladder neck fistulas; simple imperforate anus; rectal atresia and stenosis
2. Female: perineal and vestibular fistulas; simple imperforate anus; rectal atresia and stenosis; cloaca

D Clinical findings: absence of anal opening; failure to pass meconium stool; abdominal distention; meconium on perineum via fistula

E Therapeutic interventions: immediate surgical correction unless fistula is present; colostomy with multistaged surgical repair; breastfeeding recommended to prevent constipation

### **Nursing Care of Children with Anorectal Anomalies**

## Assessment/Analysis

1. Rectum for opening, passage of meconium
2. Abdomen for distention, bowel sounds

## Planning/Implementation

See Planning/Implementation under Nursing Care of Children with an Intestinal Obstruction

1. Rests comfortably
2. Achieves pattern of regular bowel elimination
3. Family demonstrates ability to care for child

## Hirschsprung Disease (Megacolon)

### **Data Base**

A Absence of parasympathetic ganglion cells in portion of large intestine

1. Bowel enlargement proximal to defect
2. Length of involved bowel varies from internal sphincter to entire colon
3. Most commonly affected site is rectosigmoid colon

B Incidence: four times more common in males

C Clinical findings

1. Manifestations may occur gradually
2. Obstipation; constipation; passage of ribbon-like or pellet-like, foul-smelling stool; rectum devoid of feces; leakage of liquid stool and gas; intestinal obstruction
3. Refusal of food; vomiting; abdominal distention
4. Biopsy of intestine identifies absence of ganglion cells

D Therapeutic interventions

1. Surgical (usually in two stages): removal of aganglionic portion of bowel with temporary colostomy, anastomosis
2. Nonsurgical management
  - a. Isotonic enemas; tap water contraindicated to prevent fluid and electrolyte imbalances
  - b. Amount based on age: 100 to 150 mL for small infant; 155 to 250 mL for older/larger infant; 255 to 360 mL for young child; 365 to 500 mL for older child

### **Nursing Care of Children with Megacolon**

## Assessment/Analysis

1. Bowel elimination history, characteristics of stools, onset of constipation
2. Abdomen for distention
3. Bowel sounds
4. Nutrition and hydration status, amount of feedings
5. Behavior for fussiness, irritability

## Planning/Implementation

1. Teach parents about disorder, preparation for surgery
2. Postoperative nursing care depends on type of surgery performed (see [Nursing Care of Children with an Intestinal Obstruction, Planning/Implementation](#))

## Evaluation/Outcomes

1. Rests comfortably
2. Achieves pattern of regular bowel evacuation
3. Family demonstrates ability to care for child

# Cardiac Malformations

## Data Base

A Disrupted circulatory changes at or shortly after birth: failure of foramen ovale, ductus arteriosus, and/or ductus venosus to close; rapid increase in pulmonary circulation resulting from decreased oxygen concentration

B Incidence: 5 to 8 per 1000 births

C Classification of cardiac defects

1. Increased pulmonary blood flow: atrial and ventricular septal defects; patent ductus arteriosus
  - a. Intracardiac communication along septum or abnormal connection between great arteries: blood flows from high-pressure left side to lower-pressure right side (left-to-right shunt)
  - b. Left-to-right shunting: increased blood pressure on right side of heart
  - c. Increased pulmonary blood flow: decreases systemic circulation
  - d. Clinical findings: signs and symptoms of heart failure
2. Decreased pulmonary blood flow: tetralogy of Fallot, transposition of great vessels, truncus arteriosus, tricuspid atresia
  - a. Obstruction of pulmonary blood flow: anatomic defect (atrial septal defect or ventricular septal defect) between right and left sides of heart
  - b. Obstruction prevents blood from exiting right side of heart; increased pressure on right side of heart exceeds pressure on left side of heart
  - c. Desaturated, oxygen-poor blood flows from right to left; desaturation in left side of heart and in systemic circulation causes right-to-left shunt
  - d. Clinical findings: hypoxemia, cyanosis, polycythemia
3. Obstruction of blood flow: coarctation of the aorta, aortic stenosis, pulmonic stenosis
  - a. Blood exiting heart meets area of anatomic narrowing or stenosis: blood flow impeded
  - b. Pressures increase in ventricle and in great artery proximal to obstruction
  - c. Pressures distal to obstruction decrease
  - d. Pressure load on ventricle increases; cardiac output decreases
  - e. Clinical findings: heart failure if significant obstruction

D General clinical findings

1. Infancy
  - a. Heart rate more than 200 beats/min
  - b. Respiratory rate about 60 breaths/min
  - c. Circumoral or generalized cyanosis
  - d. Feeding difficulty, failure to thrive (first signs usually recognized by parents)
2. Childhood
  - a. Restricted physical development, delayed milestones
  - b. Decreased exercise tolerance
  - c. Recurrent respiratory tract infections

d. Squatting or knee-chest position an adaptation for defect with decreased pulmonary blood flow or mixed blood flow; helps decrease venous return to heart

3. Dyspnea, especially on exertion

4. Stridor or choking spells

5. Heart murmurs

6. Signs of heart failure

a. Tachycardia and hypotension progressing to extreme pallor or duskiess

b. Tachypnea, dyspnea, costal retractions progressing to grunting respirations

c. Fluid retention: weight gain; ascites; pleural effusions progressing to peripheral edema

E General therapeutic interventions

1. Surgical

a. Repair of cardiac anomaly by surgery and/or interventional radiology

b. Prophylactic antibiotic therapy before surgery, before invasive procedures, may be throughout life

c. Postoperative prevention of constipation to avoid straining and Valsalva maneuver, which increase intrathoracic pressure, causing tension on sutures

2. Pharmacological (See [Chapter 6](#), Nursing Care of Clients with Circulatory System Disorders, Related Pharmacology, Cardiac Glycosides)

a. Cardiac glycosides to increase efficiency of heart action

(1) Positive inotropic effect: increases myocardial contractility

(2) Negative chronotropic effect: decreases heart rate

(3) Negative dromotropic effect: slows conduction velocity

b. Variety of medications: same qualitative effect on heart action but differ in potency, rate of absorption, amount absorbed, onset of action, speed of elimination

## Defects with Increased Pulmonary Blood Flow

### ***Ventricular Septal Defect (VSD)***

([Figure 30-2: Ventricular septal defect](#))

**FIGURE 30-2** Ventricular septal defect. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Abnormal opening between ventricles
- B Severity depends on size of opening
- C Higher pressure in right ventricle causes hypertrophy, with development of pulmonary hypertension
- D Low, harsh murmur heard throughout systole
- E Specific therapeutic intervention: transcatheter closure (TCC) with occlusive device; open heart surgical repair
- F Prognosis: single membranous defect has less than a 5% death rate; multiple muscular defects can have mortality risk of 20%

## ***Atrial Septal Defect (ASD)***

(Figure 30-3: Atrial septal defect)

**FIGURE 30-3** Atrial septal defect. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

A Types

1. Ostium primum defect (ASD1): opening at lower end of septum; may be associated with mitral valve abnormalities
  2. Ostium secundum defect (ASD2): opening is near center of septum
  3. Sinus venosus defect: superior portion of atrial septum fails to form near junction of atrial wall with superior vena cava
- B Murmur heard high in chest, with fixed splitting of second heart sound
- C Specific therapeutic intervention: transcatheter closure (TCC) with occlusive device; open heart surgical repair
- D Prognosis: less than 1% operative mortality

## **Patent Ductus Arteriosus (PDA)**

(Figure 30-4: Patent ductus arteriosus)

**FIGURE 30-4** Patent ductus arteriosus. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Failure of fetal connection between aorta and pulmonary artery to close
- B Blood shunted from aorta back to pulmonary artery; may progress to pulmonary hypertension and cardiomegaly
- C Machinery-type murmur; heartbeat heard in left second or third intercostal space
- D Specific therapeutic interventions
1. Closure of opening between aorta and pulmonary artery: insertion of coils which expand to fill the ductus; surgery
  2. Critically ill newborns: pharmacologic closure may be attempted with prostaglandin inhibitor (e.g., indomethacin [Indocin])
- E Prognosis: less than 1% mortality

## **Defects with Decreased Pulmonary Blood Flow**

### **Tetralogy of Fallot**

(Figure 30-5: Tetralogy of Fallot)

**FIGURE 30-5** Tetralogy of Fallot. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

#### A Four associated defects

1. Pulmonary valve stenosis
2. Ventricular septal defect, usually high on septum
3. Overriding aorta, receiving blood from both ventricles, or aorta arising from right ventricle
4. Right ventricular hypertrophy

#### B Specific therapeutic interventions

1. Open-heart surgery: complete repair usually performed soon after birth; closure of ventricular septal defect and resection of infundibular stenosis, possibly with pericardial patch to enlarge right ventricular outflow tract
2. Palliative treatment (Blalock-Taussig procedure): surgery to increase pulmonary blood flow; may be done prenatally

#### C Prognosis: less than 5% surgical repair mortality

### **Transposition of the Great Vessels (Arteries)**

(Figure 30-6: Transposition of the great vessels [arteries])

**FIGURE 30-6** Transposition of the great vessels (arteries). (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Aorta exits from right ventricle and pulmonary artery leaves left ventricle
- B Incompatible with life unless communication exists between both sides of heart (e.g., atrial septal defect, ventricular septal defect, patent ductus arteriosus)
- C Specific therapeutic interventions
  1. Open-heart surgery: complete repair usually performed soon after birth; transposing great vessels to their correct anatomic placement with reimplantation of coronary arteries
  2. Palliative procedures: alternative surgical procedure to prevent pulmonary vascular resistance if unable to tolerate complete repair
  3. Pharmacological: pediatric prostaglandins to dilate patent ductus arteriosus (e.g., alprostadil [Prostin VR])
- D Prognosis: 5% to 10% surgical mortality

## **Tricuspid Atresia**

(Figure 30-7: Tricuspid atresia)

**FIGURE 30-7** Tricuspid atresia. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Absence of tricuspid valve
- B Incompatible with life unless communication exists between right and left sides of heart (e.g., atrial septal defect, ventricular septal defect, patent ductus arteriosus)
- C Specific therapeutic interventions
  1. Open-heart surgery: complete repair; conversion of right atrium into outlet for pulmonary artery; placement of tubular conduit with valve closing atrial septal defect
  2. Palliative procedures: performed if unable to tolerate complete repair
- D Prognosis: surgical mortality greater than 10%

## **Truncus Arteriosus**

(Figure 30-8: Truncus arteriosus)

**FIGURE 30-8** Truncus arteriosus. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Single great vessel arising from base of heart; serves as pulmonary artery and aorta
- B Systolic murmur; single semilunar valve produces loud second heart sound that is not split
- C Specific therapeutic intervention: fetal surgery to reimplant pulmonary arteries to right ventricle
- D Prognosis: mortality of 10%

## Obstructive Defects

### **Pulmonary (Pulmonic) Stenosis**

(Figure 30-9: Pulmonary [pulmonic] stenosis)

**FIGURE 30-9** Pulmonary (pulmonic) stenosis. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Narrowing of pulmonary valve; decreased blood flow to lungs; increased pressure in right ventricle
- B Specific therapeutic intervention: valvotomy or balloon angioplasty
- C Prognosis: less than 2% mortality

# Aortic Stenosis

(Figure 30-10: Aortic stenosis)

**FIGURE 30-10** Aortic stenosis. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Narrowing of aortic valve; increased workload of left ventricle; lowered pressure in aorta reduces coronary artery blood flow
- B Specific therapeutic intervention: division of stenotic valves of aorta
- C Prognosis: mortality greater than 20% in critically ill newborns; older children have lower mortality risk

# Coarctation of the Aorta

(Figure 30-11: Coarctation of the aorta)

**FIGURE 30-11** Coarctation of the aorta. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

- A Localized narrowing of aorta near insertion of ductus arteriosus
- 1. Increased systemic circulation above stricture: bounding radial and carotid pulses; headache; dizziness; epistaxis

- 2. Decreased systemic circulation below stricture: absent femoral pulses; cool lower extremities
- B Increased pressure in aorta above defect causes left ventricular hypertrophy
- C Murmur may or may not be heard
- D Specific therapeutic intervention: angioplasty; resection of defect with anastomosis of ends of the aorta
- E Prognosis: less than 5% mortality with isolated coarctation

## ***General Nursing Care of Children with Cardiac Malformations***

### **Assessment/Analysis**

- 1. Color (e.g., cyanosis, pallor)
- 2. Apical pulse rate, peripheral pulse quality, murmurs
- 3. Respiratory rate and effort, dyspnea, frequency of colds
- 4. Blood pressure
- 5. Chest abnormalities

### **Planning/Implementation**

- 1. Teach parents home administration of medications
  - a. Administer medication at scheduled intervals; use calendar to mark off each dose; post reminder (sign on refrigerator); if vomiting occurs after administration, do not readminister dose; if dose is missed, call health care provider
  - b. Refill prescription before medication is completely used
  - c. Administer by slowly squirting it in side and back of mouth
  - d. Do not mix with other foods or fluids (refusal to consume results in inaccurate dosage)
  - e. If child has teeth, give water after administration; when possible, brush teeth to prevent tooth decay from elixir
  - f. Accidental overdose: contact health care provider or nearest poison control center immediately
- 2. Help parents cope with manifestations of illness
  - a. During dyspneic/cyanotic spell: place in side-lying knee-chest position, with head and chest elevated
  - b. Keep warm; encourage rest and sleep
  - c. Decrease child's anxiety by remaining calm
  - d. Feeding strategies
    - (1) Feed slowly, burp frequently
    - (2) Teach gavage feedings, if required
    - (3) Offer small, frequent feedings
    - (4) Introduce solids and spoon-feeding early
    - (5) Encourage to eat if anorectic
- 3. Foster growth-promoting family relationships

- a. Encourage parents to
  - (1) Discuss feelings
  - (2) Include others in child's care to prevent caregiver exhaustion
  - (3) Maintain expectations of all siblings as equally as possible
  - (4) Provide consistent discipline to prevent behavioral problems
  - (5) Avoid hazards of fostering overdependency
- b. Help parents to
  - (1) Feel adequate in their parental roles by emphasizing growth and developmental progress
  - (2) Foster development by formulating age-appropriate goals consistent with activity tolerance; provide social experiences for child
- 4. Discuss school entry with parents, teacher, and school nurse
- 5. Preoperative planning for postoperative care
  - a. Keep sleep record to organize care around usual rest pattern
  - b. Assess elimination pattern to avoid postoperative constipation and straining; know words used for elimination; teach use of bedpan
  - c. Record level of activity; list favorite toys or games that require gradually increased exertion
  - d. Determine fluid preferences
  - e. Observe verbal and nonverbal responses to pain
- 6. Prepare physically and emotionally for surgery
  - a. Based on developmental and chronologic age
    - (1) Four to 6 years: know heart is in chest; can describe it as valentine-shaped; characterize its function by sound of "tick tock"
    - (2) Seven to 10 years: know true shape of heart; know it has blood vessels; have idea of its function (e.g., "It makes you live"); do not understand concept of pumping
    - (3) Ten years and older: have concept of veins and arteries, valves, circulation; know why death occurs when heart stops beating
  - b. Based on principle that fear of the unknown increases anxiety
  - c. Prepare for cardiac catheterization
    - (1) Frequent assessments (e.g., vital signs, pulse oximetry, observation of catheter insertion site)
    - (2) Immobility of extremity used for catheter insertion site for several hours
  - d. Provide for consistency in preoperative and postoperative preparation as source of support for both child and parents (e.g., same nurse should provide care if possible)
  - e. Know what equipment is used after open- or closed-heart surgery
  - f. Encourage therapeutic play with equipment (e.g., stethoscope, blood pressure machine, oxygen mask, pulse oximeter, suction equipment, syringes without needles); for preschooler, use dolls and puppets to describe procedures
  - g. Teach about size of bandage, size of incision
  - h. Familiarize with postoperative environment (e.g., postanesthesia and intensive

care units, strange noises)

- i. Teach coughing and breathing with incentive spirometer
  - j. Explain why coughing and moving are necessary despite discomfort
  - k. Explain what tubes may be used and what they will look like
  - l. Explain to parents that chest tubes may be used to drain air and fluid from pleural cavity
7. Discuss specifics of postoperative care (similar to those for any major surgery)
  8. Identify problems associated with adjusting to improved physical status
    - a. Has become accustomed to sick role and its secondary gains
    - b. May have difficulty learning to relate to peers and siblings competitively
    - c. Disability can no longer be used as crutch for educational and social shortcomings
  9. Help family adjust to correction of cardiac defect
    - a. Improved physical status may be difficult for parents because it reduces child's dependency on them
    - b. Parental expectations must be modified to accommodate child's new physical vigor and search for independence

## **Evaluation/Outcomes**

1. Participates in appropriate activities for age, energy, and developmental level
2. Consumes sufficient nutrients for growth and development
3. Family and child discuss fears and feelings about disorder and limitations
4. Family demonstrates home care for child

# Neurologic Malformations

## Defects of Neural Tube Closure (Spina Bifida)

### ***Data Base***

A Malformation of spine: posterior portion of vertebral laminae fails to close; may range along entire length of spinal column or be restricted to small area; most common site is lumbosacral area

B Defect of occipitocervical region: swelling and displacement of medulla into spinal cord (Arnold-Chiari malformation) associated with hydrocephalus

C Associated defects: clubfeet, dislocated hip, hydrocephalus

D Associated problems: weakness or paralysis below defect, bowel and bladder dysfunction

E Incidence: largest group with multifactorial inheritance; higher in females; rates decreased with folic acid fortification before and during pregnancy

F Classification ([Figure 30-12: Midline defects of osseous spine with varying degrees of neural herniation](#))

**FIGURE 30-12** Midline defects of osseous spine with varying degrees of neural herniation. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

1. Spina bifida occulta: defect of vertebrae; spinal cord and meninges intact
2. Spina bifida cystica
  - a. Meningocele: meninges without neural elements protrude through defect; spinal fluid exits through defect
  - b. Myelomeningocele: meninges and portion of spinal cord with its nerves protrude through defect; usually in lumbosacral area; spinal fluid exits through defect
3. Anencephaly
  - a. Brain: spongiform mass with no bony covering

- b. Absence of both cerebral hemispheres
- c. Incompatible with life; intact brainstem maintains vital functions from several hours to several weeks

#### G Clinical findings

1. Defect apparent on inspection
2. Degree of neurologic dysfunction directly related to anatomic level of defect and nerves involved
3. Sensory disturbances; usually parallel motor dysfunction
4. Defective nerve supply to bladder affects sphincter and muscle tone
5. Ineffective anal sphincter control

#### H Therapeutic interventions

1. Recommendation that women of childbearing age take multivitamin with 400 mcg folic acid from one month prior to conception throughout pregnancy
2. Surgical repair of sac: maintains neurologic function, prevents infection; performed as early as possible
3. Multidisciplinary approach including habilitation

### ***Nursing Care of Children with Spina Bifida***

#### **Assessment/Analysis**

1. Condition of myelomeningocele sac
2. Level of neurologic involvement; impairment of elimination
3. Daily changes in head circumference; status of fontanel

#### **Planning/Implementation**

1. Protect against infection (breakdown of sac exposes spinal cord to environment)
  - a. Provide meticulous skin care; keep area clean of urine and feces
  - b. Apply sterile, moist, nonadherent dressing over sac to prevent drying; use sterile normal saline for moistening; change dressing every 2 to 4 hours to maintain moistness
  - c. Inspect sac for leaks, abrasions, irritation, or signs of infection
  - d. Avoid pressure on sac; do not cover with diaper
2. Measure head circumference daily; measure at greatest circumference (usually slightly above eyebrows and pinna of ears and around occipital prominence at back of skull); place marks on both sides of head to facilitate accurate serial measurements
3. Maintain in prone position to prevent injury to sac
4. Perform passive range-of-motion exercises to extremities unless contraindicated
5. Promote elimination
  - a. Observe for urinary retention or continuous leakage of urine; perform intermittent straight catheterization as ordered
  - b. Observe for bowel sphincter weakness (e.g., continual passage of stool that is not diarrhea)

6. Provide postoperative care
  - a. Maintain side-lying or prone position to prevent tension on suture line and skin graft
  - b. Measure head circumference daily because increase may indicate developing hydrocephalus
  - c. Monitor for signs of increased intracranial pressure
  - d. Use pain rating scale and medicate appropriately

## Evaluation/Outcomes

1. Remains free of infection
2. Maintains skin integrity
3. Family demonstrates ability to care for infant
4. Family continues follow-up care and habilitation

## Hydrocephalus

### **Data Base**

A Excessive accumulation of cerebrospinal fluid within ventricular system; increased intracranial pressure compresses brain against skull, decreasing blood flow to brain cells, causing necrosis

#### B Classifications

1. Classified according to cause: congenital, acquired
2. Classified according to presence or absence of obstruction
  - a. Noncommunicating: obstruction within ventricles (e.g., congenital malformation, neoplasm, hematoma)
  - b. Communicating: inadequate absorption of cerebrospinal fluid (CSF) (e.g., infection, trauma, obstruction by thick arachnoid membrane or meninges)

#### C Clinical findings

1. Increasing head size with open sutures; bulging fontanel
2. Prominent scalp veins; taut, shiny skin
3. Increased intracranial pressure (e.g., projectile vomiting not associated with feeding; irritability; anorexia; high, shrill cry; "sunset" eyes [sclera visible above iris], bulging eyes, papilledema of retina, seizures)
4. Developmental delays resulting from brain damage (e.g., head lag after 4 to 6 months of age)

#### D Therapeutic interventions

1. Limiting damage
  - a. Removal of obstruction if noncommunicating hydrocephalus
  - b. Mechanical shunting of fluid to another area of body via ventricular peritoneal shunt; catheter passed subcutaneously to peritoneal cavity; placement revised as necessary
2. Treatment of complications

# ***Nursing Care of Children with Hydrocephalus***

## **Assessment/Analysis**

1. Head circumference; daily measurements
2. Fontanel and suture lines (e.g., size, signs of bulging, tenseness, separation)
3. Signs of increased intracranial pressure
4. Status of neurologic reflexes

## **Planning/Implementation**

1. Prevent breakdown of scalp, infection, injury
  - a. Position with head elevated to facilitate draining of fluid
  - b. Support neck and head when holding infant
2. Monitor for increasing intracranial pressure
  - a. Monitor neurologic signs
  - b. Measure head circumference (see [Nursing Care of Children with Spina Bifida, Planning/Implementation](#))
3. Promote adequate nutrition
  - a. Monitor for vomiting, anorexia, behavior affecting feeding (e.g., irritability, lethargy)
  - b. Observe for signs of dehydration
  - c. Provide small, frequent feedings
  - d. Perform all care before feeding to minimize vomiting; hold if possible
4. Keep eyes moist and free of irritation if eyelids incompletely cover corneas
5. Control pain with scheduled analgesics
6. Support parents through grieving process
7. Provide care after shunt
  - a. Position flat on unoperated side to avoid too rapid reduction of intracranial fluid
  - b. Handle minimally to prevent damage to shunt
  - c. Observe shunt site (abdominal site in peritoneal procedure) for infection
  - d. Teach parents to
    - (1) Pump shunt to maintain patency when indicated
    - (2) Observe for signs of increasing intracranial pressure, infection, dehydration
    - (3) Perform range-of-motion exercises to lower extremities
8. Support parents after shunt
  - a. Explain that shunt revisions are necessary with growth and if infection occurs
  - b. Provide anticipatory guidance about observing for and recording developmental milestones
9. Monitor developmental progress

## **Evaluation/Outcomes**

1. Remains free from increased intracranial pressure

2. Remains free from infection
3. Maintains skin integrity
4. Family demonstrates ability to care for infant

# Genitourinary Malformations

## Exstrophy of the Bladder

### ***Data Base***

A Absence of portion of abdominal wall and bladder wall; bladder is outside abdominal cavity

B Associated defects

1. Pubic bone malformations, inguinal hernia
2. Males: epispadias, undescended testes, short penis
3. Females: cleft clitoris, absent vagina

C Incidence: twice as frequent in males

D Clinical findings

1. Bladder: exposed; appears inside-out
2. Constant seepage of urine leading to skin breakdown and infection
3. Progressive renal failure from infection and obstruction

E Therapeutic interventions

1. First surgery: repair of bladder and urethra within 48 hours if possible; temporary insertion of suprapubic catheter
2. Second surgery: attachment of pelvic bones
3. Surgery to repair other malformations may be combined with other surgeries
4. Urinary bypass surgery if necessary
  - a. Ileal conduit (ureteroileal cutaneous ureterostomy); ileostomy appliance worn over stoma; collects continuously flowing urine
  - b. Cutaneous ureterostomy; ureters attached directly to abdominal wall, usually at site proximal to level of kidneys; two collecting appliances worn over bilateral openings

### ***Nursing Care of Children with Exstrophy of the Bladder***

### **Assessment/Analysis**

1. Renal function, urine output
2. Condition of skin
3. Parental response; interaction with newborn/child

### **Planning/Implementation**

1. Scrupulously clean area around bladder; apply sterile, nonadherent, moist dressing over exposed bladder tissue to prevent infection
2. Monitor and maintain fluid balance because of large insensible water losses from exposed viscera
3. Dress infant with loose clothing to avoid pressure over area; change clothing frequently because of odor

4. Care for urine-collecting appliance; change frequently
5. Help parents to accept disorder and long-term sequelae

## **Evaluation/Outcomes**

1. Maintains skin integrity
2. Remains free from infection
3. Maintains renal function within acceptable limits
4. Family demonstrates ability to care for infant

# Displaced Urethral Openings

## **Data Base**

A Abnormally located urethral opening; can be sign of ambiguous genitalia

B Severity varies in males: depends on distance of opening from tip of penis, presence of other penile anomalies (e.g., chordee [head of penis curves downward])

C Classification

1. Hypospadias

a. Males: urethra opens on lower surface of penis from behind glans to perineum (placement varies)

b. Females: urethra opens into vagina

2. Epispadias

a. Occurs only in males

b. Urethra opens on dorsal surface of penis; often associated with bladder exstrophy

D Clinical findings

1. Interference with reproduction if severely affected

2. Increased risk for urinary tract infection

E Therapeutic interventions

1. Surgical repair of defect; circumcision, if desired, is delayed until after surgical repair

2. Surgery may be performed in several stages

## ***Nursing Care of Children with a Displaced Urethral Opening***

### **Assessment/Analysis**

1. Parental knowledge of defect

2. Origin of urinary stream

### **Planning/Implementation**

1. Provide parents with explanation of potential future functioning

2. Help male child to cope with anatomic difference from peers; adjustment to voiding in sitting position

3. Prepare child and parents for surgery

### **Evaluation/Outcomes**

1. Remains free from pain

2. Maintains peer interactions

3. Child and parents verbalize feelings/concerns about effects of defect

4. Surgical repair corrects voiding pattern

# Skeletal Malformations

## Clubfoot

### ***Data Base***

A Bone deformity and malposition of foot with soft tissue contracture; foot twisted out of alignment; may be misshapen

B Talipes equinovarus most common type; foot is fixed in plantar flexion (downward) and deviated medially (inward)

C Clinical findings

1. Deformity apparent at birth

2. Classification

a. Rigid or flexible

b. Mild (positional): may correct spontaneously; may require passive exercise or serial casting

c. Syndromic: associated with other congenital anomalies

d. Congenital: wide range of rigidity and prognosis; usually requires surgical intervention

D Therapeutic interventions

1. Treatment started during newborn period most successful; delay causes abnormal development of leg muscles and bones with shortening of tendons

2. Nonsurgical treatment: gentle, repeated manipulation of foot with casting; done every few days for 1 to 2 weeks, then at 1- to 2-week intervals

3. Surgical treatment: done if nonsurgical treatment ineffective

a. Tight ligaments released

b. Tendons lengthened or transplanted

4. Follow-up care

a. Emphasizes muscle reeducation (by manipulation) and correct walking

b. Corrective shoes: may have sole and heel lifts on lateral border to maintain position; shoes must be maintained in good repair

c. Extended orthopedic supervision: tendency to recur; considered cured when able to wear regular shoes and walk correctly

### ***Nursing Care of Children with Clubfoot***

### **Assessment/Analysis**

1. Parental understanding of treatment regimen

2. Skin and neurovascular assessment of affected limb

### **Planning/Implementation**

1. Provide care associated with casting

a. Monitor neurovascular status of affected extremity (e.g., color, skin temperature,

capillary refill, toe movement)

b. Check cast for weakness and wear, especially if child is allowed weight bearing

c. See [Developmental Dysplasia of the Hip, Planning/Implementation](#)

2. Teach parents neurovascular assessments, care of cast and special shoes

3. Emphasize need for follow-up, which may be prolonged

## Evaluation/Outcomes

1. Remains free from complications

2. Parents demonstrate ability to care for child

3. Continues follow-up orthopedic supervision

## Developmental Dysplasia of the Hip (DDH)

### Data Base

A Imperfect development of hip; involvement includes femoral head, acetabulum, or both

B Incidence: 60% are females

C Classification

1. Acetabular: mildest form; femoral head remains in acetabulum

2. Subluxation: most common form; femoral head partially displaced

3. Dislocation: femoral head not in contact with acetabulum; displaced posteriorly and superiorly

D Clinical findings

1. Limited abduction of leg on affected side

2. Asymmetry of gluteal, popliteal, and thigh folds

3. Audible click when abducting and externally rotating hip on affected side (Ortolani test)

4. Apparent shortening of femur on affected side

5. Waddling gait and lordosis

E Therapeutic interventions

1. Directed toward enlarging and deepening acetabulum by placing head of femur within acetabulum and applying constant pressure

2. Positioned with legs slightly flexed and abducted (e.g., Pavlik harness, spica cast, brace)

3. Surgical intervention (e.g., open reduction with casting)

## Nursing Care of Children with Developmental Dysplasia of the Hip

### Assessment/Analysis

1. Limb shorter on affected side

2. Positive Ortolani test (hip click)

3. Restricted abduction of hip on affected side

## Planning/Implementation

1. Limit risk for hypostatic pneumonia caused by enforced immobility
  - a. Change position frequently; raise head of mattress/crib rather than head only to prevent neck flexion
  - b. Teach parents postural drainage; exercises to increase lung expansion (e.g., blowing bubbles)
  - c. Encourage parents to notify health care provider immediately if congestion or cough develops
2. Maintain skin integrity
  - a. Assess circulation to toes (e.g., pedal pulses, signs of blanching)
  - b. Prevent small toys or food from slipping under cast
  - c. Teach parents to recognize signs of infection (e.g., odor)
  - d. Protect cast edges with adhesive tape or waterproof material, especially around perineum
  - e. Use disposable diapers with plastic lining to minimize soiling by feces and urine
3. Prevent constipation
  - a. Teach parents to observe child for straining on defecation
  - b. Increase fluids and high-fiber foods
4. Encourage intake of nutritious foods appropriate for activity level
  - a. Provide small, frequent meals because of inflexibility of cast around waist (window may be made over abdominal area to allow for expansion with meals)
  - b. Teach parents to adjust calorie intake because less energy expenditure can lead to obesity
5. Move and position safely when in spica cast
  - a. Use wagon or stroller with back flat or mechanic's creeper for transportation
  - b. Protect from falling when being positioned
  - c. Avoid using bar between legs of cast for lifting; two people may be needed to provide adequate body support when moving
  - d. Use specially designed car restraint system for transportation in motor vehicle
6. Meet emotional needs
  - a. Use touch as much as possible; small children can be picked up and cuddled
  - b. Stimulate and provide play activities appropriate for age
7. Provide parents with help and support
  - a. Reinforce teaching with written instructions
  - b. Schedule home visits with telephone or e-mail counseling available
  - c. Stress need for follow-up care because treatment may be prolonged
  - d. Prepare parents for application of abduction brace after cast is removed
  - e. Additional cast care (see [Chapter 11](#), Nursing Care of Clients With Neuromusculoskeletal System Disorders)

## Evaluation/Outcomes

1. Moves about and controls environment

2. Remains free of injury
3. Regains earlier movement (crawling/walking) when device is removed
4. Parents demonstrate ability to care for child

## Inborn Errors of Metabolism

### **Data Base**

A Inherited autosomal recessive trait disorders caused by absence of substances essential to cellular metabolism

B Characterized by abnormal fat, protein, or carbohydrate metabolism

### **General Nursing Care of Children with Inborn Errors of Metabolism**

### **Assessment/Analysis**

1. Verification of test results
2. Parents' understanding of disorder
3. Growth and development

### **Planning/Implementation**

1. Refer parents for genetic counseling if planning another child
2. Help parents understand disorder and role of specific diet (e.g., see [Phenylketonuria \[PKU\]](#), [Galactosemia](#))
3. Specific nursing care for children with hypothyroidism
  - a. Instruct parents regarding administration of thyroid replacement medication; signs of overdose (e.g., rapid pulse rate, dyspnea, insomnia, irritability, sweating, fever, weight loss)
  - b. Teach parents how to obtain a pulse rate

### **Evaluation/Outcomes**

1. Achieves satisfactory growth and development
2. Consumes adequate nutrients for growth
3. Child and family verbalize feelings about necessity of dietary modifications
4. Child and family verbalize and demonstrate ability to follow health regimen (prescribed diet/medications)

## Phenylketonuria (PKU)

### **Data Base**

A Lack of enzyme phenylalanine hydroxylase; changes phenylalanine (essential amino acid) into tyrosine for metabolism

B Clinical findings if untreated

1. Growth failure, frequent vomiting, irritability

2. Mental retardation; damage to nervous system by accumulation of phenylalanine
    - a. Altered mental processes apparent by 4 months of age
    - b. Intelligence quotient usually below 50, most frequently under 20
  3. Urine has strong, musty odor from phenylacetic acid
  4. Blond hair and blue eyes; absence of tyrosine reduces production of melanin
  5. Fair skin susceptible to eczema
- C Therapeutic interventions
1. Early detection essential; newborn testing is mandatory throughout United States
  2. Guthrie blood test: performed after protein ingestion; if tested during initial 24 hours, repeat test at 2 weeks of age; tandem mass spectrometry now used to detect PKU and other congenital disorders
  3. Dietary: low-phenylalanine diet calculated to allow 20 to 30 mg of phenylalanine per kg of body weight
    - a. Breastfeeding: recommended because of low-protein content; breast milk substitute (e.g., Phenex-1)
    - b. Phenylalanine-free formula (e.g., Phenex-2, Phenyl-Free) after age 3; allows for more variety of solid foods
    - c. Dietary restrictions of phenylalanine through adolescence; now recommended throughout life
    - d. Low-phenylalanine diet for women with PKU who are planning pregnancy or who are pregnant
  4. Treatment for eczema (see [Atopic Dermatitis \[Eczema\]](#), [Data Base](#))

## Galactosemia

### **Data Base**

A Missing enzyme that converts galactose to glucose

B Clinical findings

1. Weight loss, vomiting
2. Hepatosplenomegaly, jaundice
3. Cataracts

C Therapeutic interventions

1. Beutler test for galactosemia at birth mandatory in many states
2. Dietary reduction of lactose; soy-based formula as milk substitute; dietary modification usually continued until 7 to 8 years of age and possibly for life

## Hypothyroidism

### **Data Base**

A Types

1. Congenital hypothyroidism: embryonic failure to develop thyroid gland; inborn enzyme defect in formation of thyroxine
2. Lymphocytic thyroiditis (Hashimoto disease): genetic predisposition to development

of autoimmune thyroiditis; most common thyroid disease in children; may be transient and regress spontaneously within 1 to 2 years

## B Clinical findings if untreated

### 1. Congenital hypothyroidism

- a. Prolonged physiologic jaundice; feeding difficulties; inactivity (e.g., excessive sleeping, little crying); anemia; problems resulting from hypotonic abdominal muscles (e.g., constipation, protruding abdomen, umbilical hernia)
- b. Impaired nervous system development leads to mental retardation; level depends on degree of hypothyroidism, interval before therapy is begun
- c. Decreased growth and metabolic rate, resulting in increased weight
- d. Characteristic infant facies (e.g., short forehead; wide, puffy eyes; wrinkled eyelids; broad, short, upturned nose; large, protruding tongue; dry, brittle, lusterless hair with low hairline)
- e. Skin
  - (1) Mottled because of decreased heart rate and circulation
  - (2) Yellowish color from carotenemia resulting from decreased conversion of carotene to vitamin A

### 2. Lymphocytic thyroiditis

- a. Enlarged thyroid gland
- b. Hoarseness and dysphagia due to tracheal compression
- c. Some have signs of hyperthyroidism (e.g., nervousness, hyperactivity, irritability, increased perspiration)

## C Therapeutic interventions

### 1. Congenital hypothyroidism

- a. Detection: neonatal screening for thyroxine (T4) and thyroid-stimulating hormone (TSH)
  - (1) Newborn testing mandatory in all 50 states
  - (2) Performed by heelstick blood test at same time as other neonatal metabolic tests
- b. Replacement therapy with thyroid hormone: if begun before 3 months of age, chances for adequate growth and average intelligence increase

### 2. Lymphocytic thyroiditis: thyroid replacement to depress thyroid-stimulating hormone, reducing size of thyroid gland

# Health Problems that Develop during Infancy

(Some problems may continue past infancy)

## Intussusception

### Data Base

A Telescoping of a proximal section of intestine into a more distal segment; most common site at ileocecal valve ([Figure 30-13: Ileocecal valve \[ileocolic\] intussusception](#))

**FIGURE 30-13** Ileocecal valve (ileocolic) intussusception. (From Hockenberry M, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

B Incidence: males affected two times more frequently; usually occurs between 5 and 9 months of age

C Clinical findings

1. Severe paroxysmal abdominal pain, evidenced by kicking and drawing legs up to abdomen
2. One or two regular stools, then bloody mucus in stool ("currant jelly" stool)
3. Palpation of sausage-shaped mass in abdomen

D Therapeutic interventions

1. Medical reduction by hydrostatic pressure (water-soluble contrast material given as enema or air pressure) after perforation has been ruled out by sonography or x-ray examination
2. Surgical reduction; may need intestinal resection

# ***Nursing Care of Children with Intussusception***

## **Assessment/Analysis**

1. Presence and extent of abdominal pain, vomiting
2. Stools for color, consistency
3. Abdomen for sausage-shaped mass

## **Planning/Implementation**

1. Provide care for abdominal surgery
2. Provide for parental rooming-in/visits because stranger anxiety is acute

## **Evaluation/Outcomes**

1. Remains free from pain
2. Consumes sufficient nutrients for growth
3. Maintains fluid balance

## **Failure to Thrive (FTT)**

### ***Data Base***

A Failure to obtain or use calories for growth; weight and sometimes height below 5th percentile for age; persistent deviation from established growth curve

B Risk factors multifactorial: combination of infant organic disease; dysfunctional parenting behaviors; neurologic or behavioral problems; disturbed parent-child interactions; poverty; health beliefs; insufficient nutrition knowledge; family stress; psychosocial factors; feeding resistance; insufficient breast milk

C Classification

1. Inadequate caloric intake: incorrect formula preparation; neglect; food fads; excessive juice consumption; behavioral problems affecting eating; CNS problems affecting intake
2. Inadequate absorption: cystic fibrosis; celiac disease; vitamin or mineral deficiencies; biliary atresia; hepatic disease
3. Increased metabolism: hyperthyroidism; congenital heart defects; chronic immunodeficiency
4. Defective utilization: genetic anomaly (e.g., trisomy 18, trisomy 21); congenital infection

D Clinical findings: infant/child

1. Growth failure: below 5th percentile in weight, or height and weight
2. Development: inadequate social, motor, adaptive behaviors; language deficit; hearing not affected
3. Apathy; difficulty forming meaningful relationships; withdrawn behavior
4. Feeding or eating disorders (e.g., vomiting, anorexia, voracious appetite, pica, rumination)

5. Stiff and unyielding or flaccid and unresponsive; minimal smiling; not comforted by touch

6. Prone to illnesses

E Clinical findings: caregiver

1. Difficulty perceiving and assessing child's needs

2. Inadequate support system for child

3. Frequently under stress (e.g., emotional, social, financial problem/crisis)

F Therapeutic interventions

1. Investigation and treatment of underlying cause (e.g., coexisting health problems, dysfunctional parent-child relationship)

2. Reversal of malnutrition

a. Correction of nutritional deficiencies to achieve appropriate weight for height

b. Provision of sufficient calories for catch-up growth

3. Education of parents/primary caregivers regarding nutritional needs, appropriate feeding methods

## ***Nursing Care of Children with Failure to Thrive***

### **Assessment/Analysis**

1. Baseline height and weight

2. Feeding behaviors

3. Developmental level

4. Parent-infant/child interactions

### **Planning/Implementation**

1. Administer prescribed care to correct underlying illness

2. Provide optimum nutrients

a. Ensure intake of prescribed calories and nutrients

b. Document daily calorie consumption

c. Weigh daily to ascertain weight gain

3. Introduce positive feeding environment

a. Establish structured routine and follow it consistently; assign one nurse for feeding; follow feeding rhythm; be persistent

b. Hold infant/young child for feeding; maintain eye-to-eye contact; maintain calm, even tempered approach; provide quiet, nonstimulating environment

c. Give appropriate directions and praise for eating

4. Increase stimulation appropriate to developmental level

5. Offer emotional support to parents without fostering dependency

a. Arrange for opportunities to talk

b. When necessary, relieve parents of childrearing responsibilities until able and ready emotionally

c. Demonstrate appropriate infant/child care; allow to proceed at own pace

- d. Promote self-respect and confidence with praise for achievements related to infant/child's growth, development, and behavior

## **Evaluation/Outcomes**

1. Gains weight steadily
2. Child demonstrates positive response to physical/psychosocial support
3. Parent/child interactions reflect attachment behaviors
4. Parents demonstrate ability to care for child

## **Shaken Baby Syndrome**

### ***Data Base***

A Injuries caused by vigorously shaking of infant's shoulders or upper extremities while being held; can cause fatal intracranial trauma/bleeding without external signs of abuse

B Clinical findings

1. Retinal hemorrhages
2. Seizures, coma
3. Bruising
4. Skull fractures
5. Tense or bulging fontanel
6. Respiratory irregularities without stridor or adventitious breath sounds, apnea

### ***Nursing Care of Children with Shaken Baby Syndrome***

Nursing care depends on type of injuries sustained; usually involve CNS, fractures of skull and long bones, trauma to organs in thoracic and abdominal cavities

## **Sudden Infant Death Syndrome (SIDS)**

### ***Data Base***

A Sudden, unexpected, unexplained death of an apparently healthy infant younger than the age of 1 year

B Incidence: 0.57 per 1000 live births; third leading cause of death in infants between 1 month and 1 year of age

C Risk factors

1. Sleeping on abdomen or on soft bedding, pillows, comforters, quilts
2. Higher percentage of males than females
3. Low birth weight
4. Low Apgar scores
5. CNS disturbances
6. Respiratory disorders (e.g., bronchopulmonary dysplasia)
7. Exposure to environmental tobacco smoke
8. Sibling who died of SIDS

9. Maternal: very young, smoked during pregnancy, abused drugs
- D Prevention: positioning on back, on firm surface for sleep; lower incidence associated with breastfeeding
- E Clinical findings
1. Frothy, blood-tinged fluid in mouth and nose
  2. Diaper wet and full with stool (consistent with cataclysmic type of death)
  3. Disheveled bedding
  4. Pulmonary edema, intrathoracic hemorrhages found on autopsy
- F Therapeutic interventions
1. Avoidance of implying wrongdoing, abuse, or neglect
  2. Provision of support to parents
  3. Nonjudgmental attitude toward parents' attempts at resuscitation

## ***Nursing Care of Families of Infants with Sudden Infant Death Syndrome***

### **Assessment/Analysis**

1. Parental knowledge of SIDS
2. Parental support system

### **Planning/Implementation**

1. Identify differences between signs of SIDS versus child neglect or abuse
2. Avoid remarks or behaviors that may instill guilt in parents
3. Reassure parents that they could not have prevented the death or predicted its occurrence
4. Reinforce that an autopsy should be performed to confirm diagnosis
5. Arrange home visit to discuss cause of death; help parents with their guilt feelings and grieving process
6. Refer parents to national SIDS parent group

### **Evaluation/Outcomes**

1. Family exhibits positive coping behavior
2. Family uses support services
3. Family exhibits effective bereavement behaviors
4. Parents maintain supportive relationship with other children

## **Apnea of Infancy (AOI)**

### **Data Base**

A Pathologic apnea lasting at least 20 seconds; apnea of 15 seconds or less is expected at any age

B Incidence: accounts for 7% to 12% of SIDS cases

C Risk factors: sepsis, seizures, upper airway abnormalities, gastroesophageal reflux,

hypoglycemia, impaired regulation of sleep or feeding

#### D Clinical findings

1. Usually presents as an apparent life-threatening event
2. Cyanosis, marked pallor, hypotonia, bradycardia

#### E Therapeutic interventions

1. Continuous home monitoring of cardiorespiratory rhythm
2. Respiratory stimulant medication (e.g., caffeine)
3. Treatment discontinued after 2 to 3 months if insignificant number of alarms or short apneic episodes

## ***Nursing Care of Children with Apnea***

### **Assessment/Analysis**

1. Parental fears and concerns
2. Knowledge about home monitoring, cardiopulmonary resuscitation (CPR)
3. Description of apparent life-threatening event (ALTE)

### **Planning/Implementation**

1. Monitor type and quality of apneic episodes
2. Teach parents: home monitoring: stimulation/resuscitation of infant
3. Assist parents to identify and use support system

### **Evaluation/Outcomes**

1. Maintains respiratory functioning
2. Parents demonstrate effective use of equipment for home monitoring
3. Parents demonstrate CPR
4. Parents verbalize fears
5. Parents identify support system

## **Diarrhea**

### ***Data Base***

A Frequent, watery stools resulting from increased peristalsis

B Incidence: leading cause of illness in children under 5 years throughout world

#### C Classification

1. Acute: infection (e.g., bacterial, viral), parasites, diet (e.g., overfeeding, new foods, excess sugars in formula or juices), medications (e.g., antibiotics, laxatives), toxins (e.g., arsenic, lead, mercury)
2. Chronic: malabsorption syndromes (e.g., celiac disease, cystic fibrosis, short bowel syndrome, lactose intolerance); inflammatory bowel disease (e.g., ulcerative colitis, Crohn disease); food allergy; immunodeficiency (e.g., HIV, AIDS); endocrine (e.g., hyperthyroidism, Addison disease), chronic nonspecific diarrhea

## D Clinical findings

1. Frequent, watery stools
2. Severe fluid deficit
  - a. Weight loss greater than 10% (moderate dehydration)
  - b. Diminished skin turgor, dry mucous membranes
  - c. Depressed fontanel, sunken eyeballs
  - d. Urine: decreased output, dark color, increased specific gravity,
  - e. Increased hematocrit
  - f. Metabolic acidosis: decreased serum pH and bicarbonate
  - g. Irritability, stupor, seizures from loss of intracellular water and decreased plasma volume
3. Diaper dermatitis: exposure of skin to fecal constituents (e.g., enzymes); warm, moist perineal area

## E Therapeutic interventions

1. Severe diarrhea: correction of fluid and electrolyte imbalance (e.g., oral rehydration therapy [ORT], intravenous fluids/electrolytes)
2. Identification of cause; institution of appropriate therapy (e.g., antibiotics if bacterial agent is identified)

## ***Nursing Care of Children with Diarrhea***

### **Assessment/Analysis**

1. History: previous episodes, factors causing acute or chronic diarrhea
2. Diarrhea: onset, duration, frequency and character of stools
3. Vital signs (e.g., fever)
4. Frequency of vomiting if present
5. State of hydration (e.g., mucous membranes, tissue turgor, baseline weight)
6. Characteristics of bowel sounds
7. Perianal area for redness and skin breakdown
8. Laboratory tests: serum electrolytes; arterial blood gases; stools for culture and sensitivity, ova and parasites

### **Planning/Implementation**

1. Explain to parents why antibiotics and increased food intake are ineffective in treating viral diarrhea
2. Offer prescribed oral rehydration fluids or administer IV fluids/electrolytes to correct dehydration and electrolyte imbalance
3. Assess for fluid balance, dehydration or fluid overload if receiving IV fluids (e.g., daily weights, I&O)
4. Continue ordered diet, usually regular

### **Evaluation/Outcomes**

1. Consumes sufficient calories and fluids
2. Maintains skin integrity
3. Child and family use techniques to prevent transmission of infection
4. Episodes of diarrhea cease

## Vomiting

### **Data Base**

A Forcible ejection of stomach contents, usually associated with nausea

1. Controlled by CNS
2. Response to stress
3. Protective mechanism to remove toxins from body

B Associated hazards (e.g., fluid loss, electrolyte imbalance, aspiration, atelectasis, pneumonia, asphyxiation)

C Incidence: common in childhood, usually minor and of short duration

D Causes

1. Infection most common
2. Response to allergen, drug ingestion
3. Recurrent or prolonged vomiting may be related to increased intracranial pressure

E Clinical findings

1. One or more episodes of regurgitation or emesis
2. Severe vomiting
  - a. Dehydration
  - b. Tetany; seizures from severe alkalosis
  - c. Metabolic alkalosis from loss of hydrogen ions
  - d. Electrolyte imbalance

F Therapeutic interventions: correction of underlying disorder; replacement of fluid and electrolytes

### **Nursing Care of Children with Vomiting**

### **Assessment/Analysis**

1. History: pattern (chronic or intermittent episodes); circumstances preceding vomiting
2. Vomitus: amount, character, frequency
3. Behavior (e.g., irritability, lethargy)
4. Bowel sounds
5. Associated manifestations (e.g., fever, diarrhea, constipation, localized abdominal pain, fluid and electrolyte imbalances)

### **Planning/Implementation**

1. Maintain in side-lying, low-Fowler position
2. Allow to rest after feeding

3. Provide care related to gastroesophageal reflux or cardiac sphincter problems
  - a. Thicken consistency of liquids
  - b. Offer small-volume feedings every 2 to 3 hours
4. Rinse mouth after each episode of vomiting

## Evaluation/Outcomes

1. Demonstrates rehydration
2. Consumes adequate nutrients for growth and development
3. Episodes of vomiting cease

## Colic

### ***Data Base***

- A Paroxysmal abdominal pain or cramping
- B Incidence: 5% to 30% of infants; more common when younger than 3 months of age
- C Risk factors: fewer than 5% with known etiology; allergy to formula
- D Associated causes: excessive swallowing of air; size of nipple opening; shape of nipple; too rapid feeding or overfeeding; tenseness or anxiety of caregiver; maternal diet (if breastfeeding); CNS immaturity; neurochemical dysregulation
- E Clinical findings
1. Pulling up of arms and legs
  2. Red-faced crying for long periods
  3. Excessive gas
- F Therapeutic intervention: correction of underlying cause when identified

### ***Nursing Care of Children with Colic***

### **Assessment/Analysis**

1. Characteristics of cry (e.g., duration, intensity)
2. Diet of breastfeeding mother
3. Occurrence of attack in relation to feeding
4. Activity of caregiver around time of attack
5. Environmental smoke
6. Parenteral behaviors (e.g., feeding techniques, attempts to relieve gas, attempts to console infant)

### **Planning/Implementation**

1. Teach parents/caregiver to
  - a. Offer smaller, more frequent feedings
  - b. Burp frequently
  - c. Position on side after feeding
  - d. Gently massage abdomen, place heated towel on abdomen

e. Hold facedown with body across caregiver's arm, while applying gentle abdominal pressure with hand (colic carry)

2. Encourage caregiver to spend time away from infant
3. Reassure parents that condition is not life-threatening; weight will be gained; colic will subside eventually

## Evaluation/Outcomes

1. Infant rests quietly/sleeps between feedings
2. Parents demonstrate effective feeding practices
3. Parents able to continue activities of daily living

## Constipation

### **Data Base**

A Hard, dry stools; difficult to pass; infrequent

B Causes: dietary, psychologic, physiologic (e.g., Hirschsprung disease, strictures, hypothyroidism)

C Classification

1. Obstipation: long periods between defecations
2. Encopresis: constipation with fecal soiling after being toilet trained

D Clinical findings

1. "Stool withholding" behavior
2. Pain on defecation

E Therapeutic interventions

1. Dietary: increased fiber and fluid
2. Administration of mineral oil, stool softeners, mild laxatives; mineral oil not given with foods (decreases absorption of nutrients)
3. Institution of bowel retraining

### **Nursing Care of Children with Constipation**

## Assessment/Analysis

1. History of bowel habits, diet
2. Stool characteristics, frequency
3. Parent/child knowledge of elimination

## Planning/Implementation

1. Teach parents relationship among constipation and fluids, dietary fiber, and activity
2. Teach parents to
  - a. Provide foods high in fiber
  - b. Increase fluid intake based on fluid requirements for weight
  - c. Place in knee-chest position if there is distention or cramping

- d. Provide comfort as necessary based on age (e.g., cuddle infants/young children)

## Evaluation/Outcomes

1. Consumes appropriate amount of fiber and fluid
2. Establishes regular pattern of bowel elimination

## Respiratory Tract Infections

### **Data Base**

A Frequent cause of morbidity in young children

B Incidence: four to five infections/year; most severe reaction between 3 months and 3 years of age

C Acute infection: bacterial or viral

D Respiratory syncytial virus (RSV): single most important respiratory pathogen; most prevalent at younger than 1 year of age; causes 50% of pediatric hospitalizations for bronchiolitis

E Classification: acute nasopharyngitis (common cold); pneumonia; bronchitis; bronchiolitis; tonsillitis; croup syndromes (e.g., epiglottitis, laryngitis, laryngotracheobronchitis, spasmodic laryngitis, bacterial tracheitis)

F Clinical findings

1. Infection (e.g., fever; purulent discharge from nose, ears, lungs; enlarged cervical lymph nodes)
2. Cough, wheeze
3. Adventitious breath sounds, tachypnea
4. Cyanosis
5. Grunting respirations, flaring nares, substernal retractions

G Therapeutic interventions

1. Interruption of spasms and bronchial dilation
2. Antibiotics based on culture and sensitivity results
3. Humidified oxygen

## **Nursing Care of Children with Respiratory Tract Infections**

### Assessment/Analysis

1. Respirations (e.g., rate, depth, ease, rhythm)
2. Color (e.g., cyanosis, pallor)
3. Adventitious breath sounds
4. Nasal discharge, characteristics of sputum
5. Cough; laryngeal spasms
6. Inflammation of pharynx

### Planning/Implementation

1. Airborne, droplet, or contact precautions as indicated by Centers for Disease Control and Prevention (CDC)
2. Increase fluid intake to prevent dehydration from fever and perspiration, and to prevent secretions from becoming more tenacious
3. Increase humidity, maintain cool environment
  - a. Decreases febrile state, limits inflammation of mucous membrane
  - b. Causes vasoconstriction and bronchiolar dilation
4. Promote nasal and pulmonary drainage
  - a. Clean nares with bulb syringe
  - b. Suction oronasal pharynx
  - c. Perform postural drainage, chest physiotherapy
5. Assess for presence of mucous plug if restless, pale, or has tachycardia
6. Decrease stimulation to promote rest
7. Elevate head of bed
8. Administer oxygen as ordered; monitor oxygen saturation
9. Provide care related to epiglottitis
  - a. Avoid using tongue blade to visualize posterior pharynx
  - b. Keep tracheotomy set at bedside
  - c. Provide tracheostomy care (see [Chapter 7](#), Nursing Care of Clients with Respiratory System Disorders, Related Procedures, Tracheostomy Care)

## Evaluation/Outcomes

1. Maintains patent airway
2. Rests and sleeps with unlabored respirations within expected range for age

## Otitis Media

### Data Base

A Acute infection of middle ear

B Causative organisms

1. Bacterial: *Streptococcus pneumoniae*, *H. influenzae*
2. Viral: usually respiratory syncytial virus (RSV) or influenza

C Incidence: 80% have at least one episode; 50% have three or more episodes; most common between ages 6 months and 2 years; immunizations and breastfeeding lower incidence

D Classification

1. Otitis media: inflammation of middle ear
2. Acute otitis media: inflammation of middle ear space with rapid onset of signs and symptoms (e.g., fever, ear pain)
3. Otitis media with effusion: middle ear inflammation with fluid present without evidence of acute infection

E Clinical findings

1. Acute otitis media
    - a. Pain: infant frets and rubs ear or rolls head from side to side; may hit head against hard surface
    - b. Drum bulging, red; no light reflex; may rupture
  2. Otitis media with effusion
    - a. No pain or fever, but “fullness” in ear
    - b. Drum gray, bulging
    - c. Possible loss of hearing from scarring of eardrum
- F Therapeutic interventions
1. Antibiotic therapy if bacterial infection
  2. Topical analgesics for ear pain
  3. Surgery: myringotomy with insertion of tympanotomy tubes

## ***Nursing Care of Children with Otitis Media***

### **Assessment/Analysis**

1. Pain
2. Clinical manifestations of infection
3. Allergies

### **Planning/Implementation**

1. Teach parents
  - a. Administration of prescribed antibiotics; important to complete full course of therapy
  - b. Instillation of ear drops: pull auricle down and back for child younger than 3 years of age; pull auricle up and back for older child
2. Minimize recurrence
  - a. Eliminate environmental allergens, including tobacco smoke
  - b. Feed in upright position, keep water out of ears
3. Encourage follow-up care to evaluate for complications (e.g., chronic hearing loss, mastoiditis, possible meningitis)

### **Evaluation/Outcomes**

1. Sleeps and rests without signs of discomfort
2. Remains free from infection
3. Parents verbalize techniques to minimize otitis media
4. Parents verbalize importance of completion of antibiotic therapy

## **Meningitis**

### ***Data Base***

A Acute inflammation of meninges; cerebral spinal fluid affected

B Most common CNS infection of infants and children

C Classification: culture of cerebrospinal fluid to identify organism

1. Bacterial: *H. influenzae* type b, *S. pneumoniae*, *Neisseria meningitidis* (meningococcus), others; bacteria account for 95% of meningitis in children older than 2 months of age
2. Tuberculous: *Mycobacterium tuberculosis*
3. Viral or aseptic: wide variety of viral agents

D Causative organism enters cranial apertures or sinuses

E Clinical findings

1. Infants

- a. Rigidity and hyperextension of neck (opisthotonos)
- b. Irritability, high-pitched cry
- c. Fever
- d. Difficulty feeding
- e. Bulging or tense fontanel
- f. Meningococcal meningitis: vomiting, petechiae, purpuric skin rash, peripheral circulatory collapse, shock

2. Children and adolescents

- a. Increased intracranial pressure (e.g., headache, bradycardia, irritability, vomiting)
- b. Fever, nausea, and vomiting
- c. Irritability, agitation
- d. Photophobia
- e. Meningococcal meningitis: petechiae, purpuric skin rash, peripheral circulatory collapse, shock

F Therapeutic intervention: intravenous antibiotics

## ***Nursing Care of Children with Meningitis***

### **Assessment/Analysis**

1. Fever
2. Headache, irritability, vomiting
3. Seizures, nuchal rigidity
4. Bulging fontanel
5. Lumbar puncture result for causative organism

### **Planning/Implementation**

1. Provide for rest, decrease environmental stimuli (e.g., control light and noise)
2. Position on side with head supported in extension
3. Maintain droplet precautions for at least 48 hours (usually no longer contagious 48 hours after start of antibiotic therapy)
4. Maintain fluid balance because of meningeal edema; monitor intake and output, IV fluids, daily weights
5. Administer prescribed antibiotic therapy if bacterial

6. Offer emotional support for parents because of sudden onset
7. Monitor for complications (e.g., septic shock, circulatory collapse)

## **Evaluation/Outcomes**

1. Demonstrates positive response to interventions
2. Parents verbalize fears regarding child's prognosis

## **Febrile Seizures**

### ***Data Base***

A Seizure associated with febrile illness in absence of CNS infection or acute electrolyte imbalance

B Incidence: most occur between 6 months and 3 years; affects 3% to 8% of children; twice as frequent in males; may be recurrent

C Clinical findings

1. Associated with illness outside CNS
2. Temperature usually exceeds 102° F (38.8° C)

D Therapeutic interventions

1. Control of seizures with medication
2. Reduction of fever
3. Treatment of underlying cause

### ***Nursing Care of Children with Febrile Seizures***

### **Assessment/Analysis**

1. Description of seizure
2. History of present illness

### **Planning/Implementation**

1. Administer prescribed antipyretic medications (excluding aspirin); monitor tympanic or axillary temperature
2. Institute seizure precautions
  - a. Protect from injury (e.g., do not restrain, pad crib rails)
  - b. Place on flat surface in side-lying position to prevent aspiration
3. Provide care after seizure
  - a. Document time of seizure, duration, body parts involved
  - b. Suction nasopharynx if necessary
  - c. Administer oxygen if required
  - d. Observe level of consciousness and behavior after seizure
  - e. Provide rest
  - f. Maintain continuous supervision
3. Teach parents to administer antipyretics at first sign of elevated temperature

4. Prevent shivering because it increases metabolic rate, further raising body temperature
5. See [Chapter 11](#), Nursing Care of Clients With Neuromusculoskeletal System Disorders, Epilepsy, Nursing Care

## Evaluation/Outcomes

1. Maintains patent airway
2. Remains free from injury during and after seizure
3. Episodes of febrile seizures cease

## Atopic Dermatitis (Eczema)

### **Data Base**

A Pruritic papulovesicular skin reaction associated with endogenous and exogenous agents; periods of remissions and exacerbations

B Incidence: usually begins during infancy; most common during first 2 years of life

C Risk factors: heredity, family history of eczema, asthma, food allergies, allergic rhinitis

D Classification

1. Infantile: between 2 and 6 months of age; spontaneous remission by 3 years
2. Childhood: 2 to 3 years of age; 90% manifest disorder by 5 years
3. Preadolescent/adolescent: 12 years of age; continues into adulthood

E Clinical findings

1. Erythema and edema from dilation of capillaries
2. Papules, vesicles, crusts
3. Sites include cheeks, scalp, neck, flexor surfaces of arms and legs
4. Pruritus, scratching may cause secondary infection

F Therapeutic interventions

1. Relief of pruritus using systemic (e.g., diphenhydrAMINE [Benadryl]) and topical medications
2. Provision of tepid baths/topical soaks; application of emollients
3. Increased fluid intake to promote skin hydration
4. Reduction of inflammation using topical corticosteroids
5. Control of secondary infections using systemic antibiotics

### **Nursing Care of Children with Atopic Dermatitis**

## Assessment/Analysis

1. Family/child history of allergies
2. Environmental or dietary factors associated with previous exacerbations
3. Skin lesions (e.g., type, distribution)
4. Secondary infection
5. Attitude of parent/child toward lesions

## Planning/Implementation

1. Apply mitt restrains to infant's hands when unsupervised to prevent scratching; keep nails short; provide supervised, unrestrained play periods
2. Pick up frequently because of irritability, fretfulness, anorexia
3. Keep skin hydrated
4. Provide parents with list of foods permitted or omitted on elimination or restricted diet
5. Instruct parents how to apply prescribed topical ointments
6. Support parents: long-term problem; may become discouraged because comforting child is difficult

## Evaluation/Outcomes

1. Remains free from injury and infection in affected areas
2. Child/parents report adequate amount of rest/sleep
3. Parents demonstrate ability to follow medical regimen

## Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS)

### Data Base

A Infection with HIV

B Transmission

1. Vertical: from HIV-infected mother to infant (e.g., breast milk); accounts for 91% of AIDS in children
2. Horizontal: sexual assault, exposure to infected parenteral blood

C Immunosuppression: decreased number of CD4/T cells; functional defects in B cells

D Populations of affected children

1. Infants exposed during perinatal period
2. Children sexually assaulted by infected individuals
3. Adolescents infected after engaging in high-risk sexual behaviors

E Clinical findings

1. Failure to thrive
2. Hepatosplenomegaly
3. Diffuse lymphadenopathy
4. Chronic or recurrent diarrhea
5. Oral candidiasis
6. Parotitis
7. Pneumonia caused by *Pneumocystis jiroveci*
8. Neurologic involvement

F Therapeutic interventions

1. Combination antiviral medications to suppress viral replication; nucleoside reverse transcriptase inhibitors (e.g., zidovudine [AZT, Retrovir], didanosine [ddl, Videx]);

nonnucleoside reverse transcriptase inhibitors (e.g., nevirapine [Viramune]); protease inhibitors (e.g., indinavir [Crixivan], saquinavir [Invirase])

## 2. Immunizations

- a. HIV asymptomatic: diphtheria/tetanus/pertussis (DTP) vaccine; inactivated polio virus; measles/mumps/rubella (MMR) vaccine; pneumococcal and influenza immunizations; varicella vaccine contraindicated
- b. Suppressed immune system: may not be able to mount active immunity against immunizations
- c. HIV symptomatic: usually no immunizations

## 3. Prevention and management of secondary infections

## 4. Treatment of pain

## 5. Nutritional support

# ***Nursing Care of Children with AIDS***

## **Assessment/Analysis**

1. Family support; determine who is able to provide care
2. History to determine source of infection
3. Health status

## **Planning/Implementation**

1. Prevent transmission of virus
  - a. Standard precautions; transmission-based precautions if indicated
  - b. Education of family about modes of transmission
2. Provide emotional support to child and family
3. Monitor signs and symptoms of sepsis, other complications

## **Evaluation/Outcomes**

1. Does not transmit HIV virus
2. Remains free of opportunistic infections and other complications
3. Child and family maintain positive interpersonal relationships
4. Family members demonstrate appropriate care of child
5. Family members demonstrate effective bereavement behaviors

## **Emotional Disorders**

For common emotional disorders of infancy, see [Chapter 17](#), Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence

## CHAPTER 31

# Nursing Care of Toddlers

---

# Growth and Development

## Developmental Timetable

### ***Fifteen Months***

#### A Physical

1. Growth rate begins to decrease
  - a. Weight: 11 kg (24 lb)
  - b. Height: 74.7 cm (31 inches)
2. Capacity of urinary bladder increases

#### B Motor

1. Walks alone with wide-based gait; creeps up stairs
2. Builds tower of two blocks; throws objects and picks them up
3. Drinks from cup with spillage; uses spoon clumsily

#### C Vocalization and socialization

1. Has four- to six-word vocabulary, states name
2. Says "No," even while complying with request

### ***Eighteen Months***

#### A Physical

1. Growth decreases; appetite lessens (physiologic anorexia)
2. Anterior fontanel closes
3. Abdomen protrudes, larger than chest circumference

#### B Motor

1. Runs clumsily; climbs stairs or up on furniture
2. Imitates strokes in drawing
3. Drinks from cup; manages spoon
4. Builds tower of three to four cubes

#### C Vocalization and socialization

1. Has 10- or more word vocabulary
2. Has new awareness of strangers
3. Begins to have temper tantrums
4. Is ritualistic; has favorite toy or blanket; thumb sucking most prominent

### ***Two Years***

#### A Physical

1. Weight: about 11 to 12 kg (26 to 28 lb)
2. Height: about 80 to 82 cm (32 to 33 inches)

#### B Motor

1. Gross motor skills refined
2. Walks up and down stairs, one step at a time, holding onto rail
3. Builds tower of six to seven cubes; uses cubes to form a train

## C Sensory

1. Develops eye accommodation
2. Visual acuity 20/40

## D Vocalization and socialization

1. Vocabulary: about 300 words; uses two- to three-word phrases; uses pronouns
2. Obeys simple commands; shows signs of increasing autonomy and individuality; makes simple choices when possible
3. Remains ritualistic, especially at bedtime
4. Can help undress self and pull on simple clothes
5. Does not share possessions, everything is “mine”

## **Thirty Months**

### A Physical

1. Has full set of 20 temporary teeth (dental care should begin between 1 and 2 years of age)
2. Decreased need for naps

### B Motor

1. Walks on tiptoe; stands on one foot momentarily
2. Builds tower of eight blocks
3. Copies horizontal or vertical line
4. May attend to own toilet needs during day

### C Vocalization and socialization

1. Beginning to see self as separate individual from reflected appraisal of significant others
2. Sees other children as objects
3. Becomes increasingly independent, ritualistic, and negativistic

## **Major Learning Events**

### A Toilet training: most important integrative task for toddler

1. Physical maturation must be reached before training is possible; approach and attitude of parents play vital role
  - a. Sphincter control adequate when child can walk
  - b. Can retain urine for at least 2 hours
  - c. Usual age for bowel training is 22 to 30 months
  - d. Daytime bowel and bladder control usually after 2 years of age
  - e. Night control usually several months to years after achievement of daytime control; if night wetting persists to 6 years of age, investigation into cause is indicated
2. Psychologic readiness
  - a. Aware of act of elimination
  - b. Able to inform caregiver of need to urinate or defecate
  - c. Desire to please parents

3. Process of training
  - a. Usually begins with bowel, then bladder; potty chair helpful so feet touch floor
  - b. Intermittent periods of urination and fecal soiling
  - c. Regression when there is stress (e.g., new sibling)
4. Parental response
  - a. Choose specific word for act
  - b. Have specific time and place for elimination
  - c. Treat occasional “accidents” in matter-of-fact manner; avoid punishing

B Need for autonomy: parents should support independence without overprotection

1. Be consistent; set realistic limits; provide choices that do not require “yes” or “no” answers
2. Reinforce desired behavior
3. Teach self-control
4. Correct immediately after a wrongdoing

# Health Promotion of Toddlers

## Play During Toddlerhood (Parallel Play)

A Plays alongside other children but not with them

B Mostly free and spontaneous, no rules

C Short attention span, requires frequent change of toys

D Dangers associated with toys

1. Breaks toy through exploration and ingests small pieces

2. Ingests lead from lead-based paint on toys

3. Is potentially burned by flammable toys

E Imitation and make-believe play begins by age 3 years

F Suggested toys

1. Play furniture, dishes, cooking utensils, telephone

2. Puzzles with few large pieces

3. Pedal-propelled (e.g., tricycle), straddle (e.g., rocking horse)

4. Pounding, push-pull, blocks

5. Clay, crayons, finger paints

## Childhood Nutrition

A Nutritional objectives

1. Adequate nutrient intake to meet continuing growth and developmental needs

2. Sufficient calories for increasing physical activity and energy needs

3. Consumption of fresh, rather than processed, foods (e.g., fruits, vegetables)

4. Psychosocial development in relation to food patterns, eating behavior, attitudes

B Diet

1. Reflects patterns and preferences of culture, parents, and siblings

2. Calorie and nutrient requirements increase with age, despite slower growth

3. Increased variety in types and textures of foods; provision of choices to address growing independence

4. Increased involvement in feeding process; stimulation of curiosity about food environment; language learning

5. Consideration for appetite, choices, motor skills

C Eating/drinking behavior

1. Prefers finger foods

2. Prefers sweet drinks; juices should be limited to 4 ounces (120 mL) or less per day to prevent dental caries

3. TV commercials influence selection of foods (e.g., fast foods, “empty-calorie” snacks, high-carbohydrate convenience foods)

D Nutrition problems

1. Anemia: increased need for foods containing iron (e.g., enriched cereals, meat, eggs, green vegetables); chewable iron-fortified vitamins; if liquid, iron supplements should

be diluted and sipped through a straw; administer with vitamin C–containing beverage to promote absorption

2. Obesity or underweight: increased or decreased caloric intake; need for nutritional counseling
3. Low intake of calcium, iron, vitamins A and C may need supplementation
4. Mealtime struggles related to increased autonomy and parental attitudes toward food (e.g., “eat everything on plate”; “try new food”; “no dessert unless ...”); need for parental counseling

## Injury Prevention during Toddlerhood

A Leading cause of death in children between 1 and 4 years of age

B Incidence: children younger than 5 years of age account for more than half of all accidental deaths during childhood; more than half of accidental child deaths related to automobiles and fire

C Accidents related to stage of growth and development; curiosity about environment

### 1. Motor vehicle

- a. Walking or running, especially chasing after objects thrown into street
- b. Inability to determine speed; lack of experience to foresee danger
- c. Out of sight because of small size; can be hit by car backing out of driveway or when playing in leaves or snow
- d. Failure to restrain in car (e.g., sitting in person’s lap; incorrect use of seat belt on car restraint)

### 2. Burns

- a. Investigating: pulls pot off stove; plays with matches; inserts object into wall socket
- b. Climbing: reaches stove, oven, ironing board and iron, objects on tables

### 3. Poisons

- a. Developing fine motor skills; able to open bottles, cabinets, jars
- b. Climbing to previously unreachable shelves and cabinets
- c. Learning new tastes and textures; uses mouth to identify and explore objects; finds and eats/drinks what is within reach (e.g., cleaning products, medications)

### 4. Drowning

- a. Child and parents do not recognize danger of playing in or near water
- b. Unaware of inability to breathe under water

### 5. Interested in body openings

- a. Puts everything in mouth; may aspirate small objects
- b. May put foreign objects in ear or nose

### 6. Fractures

- a. Climbing, running, jumping
- b. Still developing sense of balance

# Hospitalization of Toddlers

## Data Base

- A Experiences basic fears of loss of love, of unknown, of punishment
- B Immobilization and isolation influence physical (particularly neurologic) and psychosocial development
- C Regression to earlier behaviors may occur
- D Stages of separation anxiety
  1. Protest
    - a. Prolonged loud crying, consoled by no one but parent or usual caregiver
    - b. Continually asks to go home
    - c. Rejection of nurse or any other stranger
  2. Despair
    - a. Alteration in sleep pattern
    - b. Decreased appetite and weight loss
    - c. Diminished interest in environment and play
    - d. Relative immobility and listlessness
    - e. Sad facial expression
    - f. Unresponsive to stimuli
  3. Detachment or denial
    - a. Cheerful, indiscriminating friendliness
    - b. Lack of acknowledgment of parents

## General Nursing Care of Toddlers

- A Prepare parents and child for hospitalization
  1. Promote parent-child relationship by limiting separation (open visiting hours have reduced incidence of separation anxiety)
  2. Prepare minimally for hospitalization because of limited cognitive ability to grasp verbal explanation
  3. Determine routines and rituals concerning toilet training, feeding, bathing, sleep pattern; incorporate into the plan of care
  4. Ask parents to bring child's favorite items from home (e.g., blanket, toy, bottle, pacifier)
  5. Prepare parents for child's reaction to separation; pounding toys helps release anger associated with temper tantrums or separation
  6. Prepare parents for child's regression to previous modes of behavior and loss of newly learned skills
- B Minimize separation anxiety and other emotional traumas during hospitalization
  1. Parental visits
    - a. Encourage to stay with child in hospital; if possible, have one parent room-in throughout hospitalization

- b. If not rooming-in, encourage frequent visits; explain that frequent visits for short periods of time are more therapeutic than one long visit
- c. Associate visits with familiar events, such as “Mommy is coming after lunch”
- d. If unable to visit, establish contact by phone and/or computer which enables visualization (e.g., Skype); be alert for behavioral changes when parents cannot stay or visit child

## 2. Parental involvement with care

- a. Assist to identify what, if any, care they wish to provide; support them in their decision
- b. Involve appropriately because anxiety may be transmitted to child
- c. Explain what care can be provided by parents and what care is provided by health team staff

## C Provide emotional support.

- 1. Plan for consistent caregiver, as much as possible, who can offer individual attention, physical touch, and sensory stimulation
- 2. Establish routine similar to home routine by continuing rituals and providing favorite items from home
- 3. Maintain familiarity with home by talking about parents, having child listen to tape recordings of family members’ voices, showing photographs of family members
- 4. When family members leave, stay to provide comfort to child and to reassure parents
- 5. Accept regression; avoid teaching new skills
- 6. Encourage release of tension, especially aggression, through play (e.g., knocking blocks over, scribbling on paper, peg and pounding board)
- 7. Comfort when sedation is necessary during procedures (e.g., CT scan, MRI)

# Health Problems Most Common in Toddlers

## Tooth Decay (Dental Caries)

### *Data Base*

#### A Incidence

1. Affects more children in United States than any other chronic infectious disease (five times more common than asthma)
2. By age 17 more than 7% of adolescents have lost at least one permanent tooth to decay

#### B Risk factors: poverty, disability, HIV infection, inadequate diet, inadequate dental hygiene

#### C Clinical finding if untreated

1. Pain and infections
2. Problems with eating, speaking, playing, learning, social development

#### D Therapeutic interventions

1. Early prevention
  - a. Regular dental visits, preferably in first year, but at least in second year
  - b. Rigorous dental hygiene
  - c. Diet rich in vitamins and minerals; limited sweets and sweet drinks
  - d. Supplemental fluoride, depending on water supply and parental beliefs
  - e. Application of dental sealants
2. Treatment
  - a. Repair of cavities
  - b. Measures to prevent further decay

### *Nursing Care of Children with Tooth Decay*

### Assessment/Analysis

1. Parental knowledge of preventative oral care
2. Condition of mouth and teeth
3. Oral hygiene routine
4. Diet history; type of snack foods and drinks

### Planning/Implementation

1. Teach parents to start cleaning teeth when they first erupt; use clean, damp cloth
2. Teach parents care of teeth beginning at 2 years of age
  - a. Use soft toothbrush
  - b. Begin using pea-size amount of toothpaste with fluoride, if needed
  - c. Brush twice a day, beginning at 2 years of age
  - d. Supervise brushing of teeth to ensure correct technique
3. Encourage parents to offer nutritious meals and snacks; limit sweet juices (120 mL per day)

4. Instruct parents to take child for first dental exam between 1 and 2 years of age, then every six months
5. Recommend that parents discuss fluoride supplementation and dental sealants with health care provider

## Evaluation/Outcomes

1. Receives regular oral health examinations and prophylaxis as needed
2. Avoids/corrects tooth decay

## Burns

(See [Chapter 10](#), Nursing Care of Clients With Integumentary system Disorders, [Burns](#), for additional information)

### **Data Base**

A Incidence: third leading cause of unintentional injury and related death among children 14 years of age and younger

B Risk factors: younger than 5 years of age, limited control of environment, minimal ability to act promptly and appropriately

C Causative agents:

1. Thermal (e.g., flame, hot water)
  - a. Young children: scald burns caused by hot liquids and steam
  - b. Older children: direct contact with fire

2. Chemical, electrical, radiation

D Classification

1. Depth of injury

(See [Chapter 10](#), Nursing Care of Clients With Integumentary system Disorders, [Burns](#), Data Base)

2. Extent of injury

- a. Described as percentage of total body surface area (TBSA) injured
- b. Standard adult rule of nines cannot be used in children younger than 15 years of age; modifications for newborn, infant, 5-year-old, 10-year-old, 15-year-old ([Figure 31-1: A & B](#), Estimation of distribution of burns in children)

**FIGURE 31-1** Estimation of distribution of burns in children. **A**, Children from birth to age 5 years. **B**, Older children to adult. (From Hockenberry M, Wilson D: *Wong's essentials of pediatric nursing*, ed 8, St. Louis, 2009, Mosby.)

## E Clinical findings

1. Local response
  - a. Edema
  - b. Fluid loss from nonprotected skin
  - c. Circulatory stasis usually restored within 24 to 48 hours in partial-thickness burns
2. Systemic response
  - a. "Burn shock" causes precipitous drop in cardiac output; restored in 24 to 36 hours
  - b. Increased metabolic rate

- c. Physiologic stress response
- d. Paralytic ileus may develop
- e. Anemia: initially, elevated hematocrit because fluid shifts from intravascular space; later, increased red cell fragility contributes to decreased RBC life span
- f. Metabolic acidosis
- g. Post-burn growth retardation: severe growth delays in height and weight if burn is greater than 40% TBSA; growth lag may last for up to 3 years

#### F Therapeutic interventions

1. Burning process is stopped
  - a. Source of danger removed
  - b. Smoldering clothes removed
  - c. Superficial burns: immersed in cool water
2. First aid administered promptly
  - a. Patent airway maintained
  - b. Superficial burns: cleansed, sterile dressing soaked in sterile saline applied, if possible; avoidance of creams, butter, or household remedies
  - c. Severe burns (more than 10% of body): oral fluids withheld
3. Transportation to appropriate health care facility as quickly as possible
  - a. Large body surface area in proportion to weight results in greater potential for fluid loss
  - b. Shock: primary cause of death in first 24 to 48 hours
  - c. Infection: primary cause of death after initial period
4. Treatment of fluid and electrolyte loss
  - a. Greatest in first 24 to 48 hours because of tissue damage
  - b. Immediate replacement of fluids and electrolytes
  - c. Monitoring of hematocrit, hemoglobin, and blood chemistry levels provide guide for fluid replacement
5. Tetanus prophylaxis as needed
6. Management of pain
  - a. Opioids (e.g., morphine sulfate, fentanyl [Sublimaze])
  - b. Anesthetic agents during procedures (e.g., nitrous oxide, propofol [Diprivan])

## ***Nursing Care of Children with Burns***

### **Assessment/Analysis**

1. Wound assessment/classification
2. Vital signs, respiratory status
3. Fluid balance, nutritional needs
4. Severity of pain on pain rating scale

### **Planning/Implementation**

1. Maintain fluids and electrolytes

- a. Administer prescribed fluids meticulously, both in time and in volume
- b. Monitor fluid status (e.g., daily weights, I&O, weigh diapers)
2. Maintain NPO if paralytic ileus occurs
3. Help limit pain
  - a. Distinguish pain from fear of being left alone, or being in strange surroundings
  - b. Use pain rating scale and medicate appropriately
4. Maintain standard precautions; use personal protective equipment
5. Meet psychosocial needs of child who is isolated from others
  - a. Recognize that isolation may provoke feelings of guilt and punishment
  - b. Recognize that children younger than 5 years of age are frightened by isolation and personal protective equipment
  - c. Recognize that touch needed for comfort and security may now be painful; reestablish pleasurable touch (e.g., apply lotion to unaffected areas); maximize use of other senses to promote security and comfort
  - d. Encourage child to express feelings verbally, or through play, if possible
6. Provide for adequate nutrition
  - a. Consider that initial hypometabolic state is followed by hypermetabolic state (begins about fifth day post injury), causing decreased lean body mass, muscle weakness, immunodepression, inadequate wound healing
  - b. Offer diet high in protein, vitamins, calories; should be started immediately after paralytic ileus resolves
  - c. Encourage eating; may be anorectic because of discomfort, isolation, depression, fear
  - d. Take advantage of food preferences when feasible; avoid forcing to eat or using food as a weapon; encourage parent participation
  - e. Alter diet as needs change, especially when high-calorie foods are no longer needed
  - f. Provide care related to tube feeding if unable to eat (e.g., assess for gastric return and residual before feeding, ensure tube is cleared after feeding with predetermined amount of water)
7. Prevent contractures
  - a. Make moving a game; initiate play that uses affected part (e.g., throwing ball for arm movement)
  - b. Maintain functional body alignment
  - c. Perform passive exercises during bath or whirlpool treatments
  - d. Administer prescribed analgesics before exercise
8. Meet emotional needs
  - a. Encourage to play with gown, mask, gloves, bandages
  - b. Prepare for baths and whirlpool treatments, which can be frightening and painful
  - c. Encourage to reenact treatments and care to work through feelings
  - d. Help to cope with changes in body
    - (1) Younger child: support parents whose reactions are communicated
    - (2) Older child, especially during adolescence when body appearance is of great concern: devise ways to conceal affected areas, especially when peers visit; emphasize how to improve looks (e.g., wigs, cosmetics, clothing, eventual plastic

surgery)

9. Teach prevention of burn injuries
  - a. Educate children regarding fire safety
    - (1) Teach to leave house as soon as smoke is smelled or flames are seen, without stopping to retrieve pet or toy
    - (2) Involve all family members in fire drills
    - (3) Demonstrate and practice “stop, drop, and roll” rather than running if clothes are on fire
  - b. Educate parents in regard to their child’s growth and development, about specific dangers at each age level
  - c. Educate parents how to prevent burns in the home
    - (1) Avoid leaving children unattended
    - (2) Cautiously use heaters, barbecue grill, and fireplace; place shield in front of heating unit
    - (3) Maintain integrity of electrical system
    - (4) Regulate household water heater to no higher than 120° F (mandated in several states)
    - (5) Use and maintain smoke and carbon monoxide detectors

## Evaluation/Outcomes

1. Remains comfortable
2. Maintains fluid and nutritional balance
3. Heals with minimal scarring
4. Remains free from infection
5. Regains flexibility and functional capacity of joints
6. Child and family members verbalize feelings and concerns about appearance

## Poisoning

### Data Base

A Ingestion of/exposure to toxic substance; ingestion of excessive amount of nontoxic substance

B Incidence: more than 90% occur in home

C Risk factors: younger than 4 years of age; inadequate storage of toxic or potentially toxic substances

D Most commonly ingested substances

1. Cosmetics and personal care products (e.g., perfume, aftershave)
2. Cleaning products (e.g., household bleach, disinfectants)
3. Plants (e.g., nontoxic gastrointestinal irritants, oxalates)
4. Medications: prescribed, over-the-counter (OTC) (e.g., acetaminophen, ibuprofen), for pets
5. Foreign bodies, toys, miscellaneous (e.g., thermometer, bubble blowing solution)

# ***General Nursing Care of Children with Poisoning***

## **Assessment/Analysis**

1. General response after ingestion/exposure
2. Vital signs
3. Need for respiratory or cardiac support
4. See clinical findings for specific types of poisoning

## **Planning/Implementation**

1. Terminate exposure
  - a. Empty mouth of pills, plant parts, other material
  - b. Flush eyes with tap water if necessary
  - c. Flush skin, wash with soap and soft cloth
  - d. Remove clothing, especially if exposed to pesticide, acid, alkali, or hydrocarbon
  - e. Bring into fresh air if inhalation poisoning
2. Report poisoning
  - a. Call poison control center, emergency facility, clinic, or health care provider for immediate advice regarding treatment
  - b. Save all evidence of poison (e.g., container, vomitus, urine)
3. Do not induce vomiting
  - a. Aspiration of low-viscosity hydrocarbon (e.g., gasoline, lighter fluid, mineral seal oil [found in furniture polishes]): vomiting can cause severe chemical pneumonitis
  - b. Ingestion of strong corrosive (e.g., acid or alkali, such as drain cleaners, bleach, electric dishwasher detergent, batteries): emesis of corrosive reinjures mucosa of esophagus and pharynx
4. Remove poison
  - a. Administer activated charcoal (1 g/kg of body weight), if possible within 1 hour of ingestion; can be effective within 4 hours of ingestion of injurious substance
  - b. Prepare equipment for gastric lavage if within 1 hour of ingestion
5. Prevent aspiration when vomiting
  - a. Keep head lower than chest
  - b. When alert, place head between legs
  - c. When unconscious, position on side
6. Provide care for latent manifestations of poisoning
  - a. Monitor vital signs
  - b. Treat appropriately (e.g., institute seizure precautions, keep warm, position for shock; reduce temperature if hyperpyretic)
7. Support child and parent
  - a. Keep calm and quiet
  - b. Do not admonish or accuse child or parent of wrongdoing
8. Teach parents prevention of poisoning
  - a. Institute anticipatory guidance based on child's age and developmental level

- b. Refer to appropriate agency for evaluation of home environment and need for safety measures
- c. Provide assistance with environmental manipulation when needed
- d. Emphasize importance of safe storage of all substances
- e. Teach children about hazards of ingesting nonfood items
- f. Caution against keeping large amounts of medicines on hand
- g. Discourage transferring medications to containers without safety caps

## Evaluation/Outcomes

- 1. Recuperates free from complications
- 2. Parents and child demonstrate knowledge concerning prevention of future poisoning

## Acetaminophen Poisoning

### **Data Base**

A Most common

- 1. Therapeutic dose: 50 to 75 mg/kg/day
- 2. Toxic dose: 150 mg/kg/day

B Clinical findings: overdose

- 1. First 2 to 4 hours: nausea, vomiting, profuse diaphoresis, pallor
- 2. Latent period (24 to 36 hours): symptoms subside; slow, weak pulse
- 3. Hepatic involvement (may last up to 7 days or be permanent): pain in right upper quadrant, jaundice, confusion, stupor, coagulation abnormality
- 4. Gradual recovery if death does not occur during hepatic coma

C Therapeutic interventions

- 1. IV fluids
- 2. Administration of oral antidote: acetylcysteine (Acetadote)

### **Nursing Care of Children with Acetaminophen Poisoning**

A Determine amount ingested

B Monitor electrocardiograph

C Measure I&O

D Monitor vital signs

E Obtain blood for hepatic and renal function tests

F Support child and family

G See [General Nursing Care of Children with Poisoning](#)

## Salicylate Poisoning and Toxicity

### **Data Base**

A Toxic dose: 300 to 500 mg/kg body weight or 7 adult aspirins (28 baby aspirin) for 9 kg (20 lb) child

## B Clinical findings

### 1. Acute poisoning

- Dehydration caused by nausea and vomiting, diaphoresis, fever, hyperpnea; results in oliguria, other signs of dehydration
- Metabolic acidosis
- Tinnitus, dizziness, disturbances of hearing and vision
- Disorientation, delirium, confusion, coma

### 2. Chronic poisoning

- Ingestion of more than 100 mg/kg/day for 2 or more days
- Subtle onset, dehydration, coma, seizures
- Bleeding

## C Therapeutic interventions

- Emesis, gastric lavage, activated charcoal, saline cathartics if life-threatening
- IV fluids with sodium bicarbonate for correction of acidosis
- Vitamin K if bleeding
- Peritoneal dialysis if severe complication
- Hypothermia blanket for hyperthermia

## ***Nursing Care of Children with Salicylate Poisoning***

A Identify amount of salicylate overdose

B Assess blood gases and serum electrolyte concentration

C Administer sodium bicarbonate, electrolytes, and vitamin K as prescribed

D Use hypothermia blanket for hyperthermia

E See [General Nursing Care of Children with Poisoning](#)

## **Petroleum Distillate Poisoning**

### ***Data Base***

A Distillates: kerosene, turpentine, gasoline, lighter fluid, furniture polish, metal polish, benzene, naphthalene, some insecticides, cleaning fluid

B Clinical findings

- Gagging, choking, coughing
- Nausea, vomiting
- Weakness, alterations in sensorium (lethargy)
- Pulmonary involvement: tachypnea, cyanosis, substernal retractions, grunting

C Therapeutic interventions

- Vomiting not induced because aspiration may result in chemical pneumonia
- Gastric decontamination and emptying are questionable; if gastric lavage must be performed, a cuffed endotracheal tube is inserted to prevent aspiration
- Symptomatic treatment (e.g., oxygen, humidity, antibiotics for chemical pneumonia)

## ***Nursing Care of Children with Petroleum Distillate Poisoning***

A Identify distillate ingested and amount

B Prevent further irritation

1. Avoid causing emesis
2. Implement gastric lavage if ordered

C See [General Nursing Care of Children with Poisoning](#)

## Corrosive Chemical Poisoning

### ***Data Base***

A Corrosive chemicals (e.g., oven and drain cleaners, electric dishwasher granules, strong detergents)

B Clinical findings

1. Severe burning pain in mouth, throat, and stomach
2. Respiratory obstruction (e.g., white, edematous mucous membranes; edema of lips, tongue, and pharynx)
3. Strong chemical odor
4. Violent vomiting, hemoptysis, hematemesis
5. Signs of shock
6. Anxiety and agitation

C Therapeutic intervention

1. Vomiting is never induced because regurgitation of substance will further damage mucous membranes
2. Esophageal stricture: repeated dilations, surgery

### ***Nursing Care of Children with Corrosive Chemical Poisoning***

A Identify ingested substance and amount

B Maintain patent airway

1. Examine pharynx for burns, monitor for respiratory difficulty
2. Have emergency equipment available; insert airway if necessary
3. Administer steroids if prescribed

C Prevent further irritation

1. Avoid causing emesis
2. Give NPO except as ordered and tolerated, dilute with water or milk (no more than 120 mL)
3. Do not neutralize substance because neutralization can cause an exothermic reaction, which produces heat and causes more injury (e.g., thermal burn in addition to chemical burn)

D Provide comfort and support to child and family

1. Use pain rating scale and medicate appropriately
2. Remain with child
3. Keep parents informed of their child's progress

E See [General Nursing Care of Children with Poisoning](#)

# Lead Poisoning (Plumbism)

## **Data Base**

A Prevalent, significant, preventable health problem that causes neurologic, intellectual, and developmental problems based on level of exposure

### B Incidence

1. Decreased since screening of children at risk and banning of lead-based paint and leaded gasoline in United States
2. Peak blood levels at about 2 years of age
3. About 25% living in or near houses with deteriorating lead-based paint
4. High in Hispanic children related to cultural use of lead in/on toys and other articles

### C Risk factors

1. Younger than 6 years of age (hand-to-mouth behavior)
2. Poverty
3. Living in urban areas and housing with peeling lead-based paint
4. Pica practice
5. Exposure to or ingestion of soil, dust, drinking water with lead, parental occupations, toys, trinkets, hobbies involving lead

### D Clinical findings (chronic ingestion)

1. Subclinical effects on central nervous system (CNS)
  - a. Alterations in hearing, balance
  - b. Lead line on teeth and long bones, joint pain
  - c. Behavioral changes: impulsivity, inattentiveness, hyperactivity, disorganization, difficulty following directions, aggression, delinquency
  - d. Decreased mental ability; increased number of high school dropouts
2. Clinical effects of high blood levels
  - a. Anemia: pallor, listlessness, fatigue
  - b. Proximal tubular damage: proteinuria, glycosuria, ketonuria, decreased vitamin D
  - c. CNS effects: lead encephalopathy, mental retardation, paralysis, blindness, convulsions, death

### E Therapeutic interventions

1. Cooperation with state health department in investigating and decreasing source
2. Instituting professional cleaning, paint stabilization, removal and replacement of lead-based building components
3. Screening: universal at 1 to 2 years of age; 3 to 6 years if not previously screened; more than once if at risk
4. Reduction of lead concentration in blood and soft tissue
  - a. Chelation therapy: removes lead from circulating blood and some lead from organs; does not reverse CNS damage
  - b. Succimer (Chemet)
    - (1) Oral chelating agent used if blood lead level is greater than 45 mcg/dL
    - (2) Adverse effects: nausea, vomiting, diarrhea, loss of appetite, rash, liver damage, neutropenia

- (3) Adequate hydration to facilitate clearance of chelates through kidneys
- c. Edetate calcium disodium: used when succimer is ineffective; given IM or IV; rarely used

## 5. Prevention of further ingestion

### ***Nursing Care of Children with Lead Poisoning***

- A Provide anticipatory guidance to parents of infants and toddlers about prevention of lead poisoning
- B Assess lead hazards in home and child-care settings
- C Determine environmental exposure and oral ingestion
- D Screen children at risk by recognizing clinical findings, especially behavioral changes
- E Monitor urinary output; keep well hydrated
- F Teach parents correct administration of succimer (Chemet)
- G Monitor for side effects of succimer

## **Aspiration of Foreign Objects**

### ***Data Base***

- A Obstruction of airway by foreign object in any part of larynx or bronchi
- B Incidence: most common from 1 to 3 years of age; leading cause of accidental death in children younger than 1 year of age
- C Risk factors: ingestion of foods that can cause asphyxiation (e.g., hot dogs, round candy, peanuts, grapes, raisins, popcorn), ingestion of small articles (e.g., coins, parts of toys)
- D Classification
  - 1. Partial obstruction: time interval (hours to days) without symptoms
  - 2. Complete obstruction: emergency situation
- E Clinical findings
  - 1. Partial obstruction: persistent respiratory tract infection; hoarseness or garbled speech; wheeze; stridor
  - 2. Complete obstruction: substernal retractions; inability to cough or speak; increased pulse and respiratory rates; cyanosis
- F Therapeutic interventions
  - 1. Partial obstruction: no intervention; allowed to continue coughing until object is dislodged; if object not dislodged, call emergency services (911); prepare child for transport
  - 2. Complete obstruction: immediate first aid
    - a. Infant
      - (1) Turn upside down (head lower than chest)
      - (2) Give up to five quick, sharp back blows with heel of hand between scapulae
      - (3) Turn over and give up to five quick chest thrusts using CPR technique

- b. Age 1 year and older: abdominal thrust (Heimlich maneuver) based on age
- 3. Medical removal by bronchoscopy
- 4. Surgical relief by a tracheotomy below level of object

## **Nursing Care of Children Who Aspirate Foreign Objects**

### **Assessment/Analysis**

- 1. Breathing pattern
- 2. Absence of speech
- 3. Color

### **Planning/Implementation**

- 1. Teach parents how to prevent aspiration of foreign bodies
  - a. Keep small objects such as balloons, buttons, batteries, coins out of reach; inspect larger toys for removable parts
  - b. Avoid offering
    - (1) Hard, smooth foods (e.g., peanuts, raw vegetables) that must be chewed with grinding motion; mastery achieved at 4 years of age
    - (2) Round, firm foods (e.g., hot dogs, carrot sticks); cut or break food into bite-sized pieces
- 2. Encourage parents to teach children not to run or laugh with food or fluid in mouth and to chew food well before swallowing

### **Evaluation/Outcomes**

- 1. Regains a patent airway
- 2. Child and parents verbalize ways to prevent future airway obstruction

## **Pinworms (Enterobiasis)**

### **Data Base**

A Infestation of GI tract by nematode *Enterobius vermicularis*

- 1. Eggs enter mouth; hatch, mature, migrate, and mate in intestine
- 2. Adult females migrate to anus at night and lay eggs, which hatch on perianal skin

B Incidence

- 1. Most common intestinal parasite in United States
- 2. At any given time 30% of all children affected

C Risk factors

- 1. Infestation
  - a. Breathing airborne ova
  - b. Hand-to-mouth exploratory behavior of toddlers
  - c. Crowded conditions (e.g., classrooms, daycare centers) increase risk for transmission

2. Reinfestation through fingers-to-anus-to-mouth route

D Clinical findings

1. Severe pruritus of anal area; pinworm eggs and pinworms isolated from perianal area
2. Irritability and insomnia
3. Anorexia, weight loss
4. Eosinophilia
5. Signs of complications: vaginitis, appendicitis

E Therapeutic interventions: administration of mebendazole (Vermox); pyrantel (Antiminth)

1. Selectively and irreversibly inhibits uptake of glucose and other nutrients by pinworms
2. Adverse effects: occasional, transient abdominal pain and diarrhea

## ***Nursing Care of Children with Pinworms***

### **Assessment/Analysis**

1. Perianal area for signs of inflammation
2. Cellophane tape test in morning before bowel movement to collect eggs

### **Planning/Implementation**

1. Prevent reinfestation by educating parents
  - a. Wash anal area thoroughly
  - b. Apply tight diaper or underpants; change clothes and bedding daily; wash in hot water
  - c. Keep child's fingernails short; insist on wearing mittens, if necessary
  - d. Air bedroom; dust and vacuum house thoroughly
2. Teach parents about administration of medication
  - a. Increasing dose will not produce a quicker recovery
  - b. Stools contain worms; may turn bright red from medication
  - c. Additional series of medication may be used, frequently 2 weeks after initial dose; all family members should be treated

### **Evaluation/Outcomes**

1. Maintains intact perianal skin
2. Produces stool that is free of infestation

## **Child Maltreatment**

### ***Data Base***

A Types

1. Physical abuse: minor physical abuse responsible for more reported cases than major physical abuse, resulting in increased mortality
2. Neglect: most common form of maltreatment (e.g., emotional, physical)
3. Sexual abuse: incest, molestation, exhibitionism, pedophilia, child pornography,

prostitution; directed at females four times more than at males

4. Emotional abuse: acts or omissions that have caused, or could cause, serious behavioral, cognitive, emotional, or mental disorders

#### B Significant social problem that precipitated Child Abuse Prevention and Treatment Act (CAPTA)

1. Child abuse and neglect: any recent act or failure to act that results in imminent risk of death, serious physical or emotional harm, sexual abuse, or exploitation of a child by a parent or caretaker who is responsible for child's welfare
2. Sexual abuse: employment, use, persuasion, inducement, enticement, or coercion of any child to engage in, or assist any other person to engage in, any sexually explicit conduct or any simulation of such conduct for the purpose of producing any visual depiction of such conduct; includes rape, statutory rape, molestation, prostitution, or other forms of sexual exploitation of children or incest with children

#### C Characteristics of abuser

1. History of abuse or neglect as a child
2. Low self-esteem
3. Substance/alcohol abuse
4. Young maternal or paternal age
5. Difficulty controlling aggressive impulses; use of violence to resolve conflicts
6. Depression or other mental illness
7. Unwanted, unplanned pregnancy
8. Ignorance and negative perception of typical childhood behavior (e.g., awakening at night, separation anxiety, exploration, ritualism, negativism, physiologic anorexia, difficult toilet training, enuresis); unrealistic expectations of child

#### D Characteristics of child

1. Emotional and behavioral difficulties
2. Chronic illness
3. Physical or developmental disability, preterm birth

#### E Environmental characteristics

1. Social isolation from support system and community
2. Poverty, crowded living conditions
3. Unemployment
4. Unpredictable, unstable surroundings
5. Frequent change of location
6. Inadequate parental education
7. Single-parent home
8. Non-biologically related male living in home
9. Family or intimate partner violence

#### F Clinical findings

1. Physical evidence of abuse/previous injuries
2. Conflicting stories about injury; injury blamed on sibling or another party
3. Inappropriate parental response (e.g., exaggerated or absent; rarely looks at or touches child; failure to sign consent for additional tests; delay in seeking treatment)

4. Inappropriate response of child (e.g., little or no reaction to pain; fear of being touched; excessive or lack of separation anxiety; indiscriminate friendliness to strangers)

#### G Therapeutic interventions

1. Treatment of injury
2. Protection of child from further abuse
3. Suspected abuse reported to local authorities; all states and provinces in North America have laws for mandatory reporting

## ***Nursing Care of Children Who Are Maltreated***

### **Assessment/Analysis**

1. History of injury: objective data from examination does not match story told by parents (e.g., "Toddler fell off of chair" while examination reveals spiral fracture of femur, which would not result from this type of fall)
2. Physical status: evidence of past injuries (e.g., skeletal, soft tissue); failure to thrive
3. Parent-child interaction
4. Developmental level

### **Planning/Implementation**

1. Monitor for clues that indicate neglect or abuse
  - a. Child
    - (1) Unexplained injuries, scars, bruises
    - (2) Physical signs of neglect (e.g., malnourished, dehydrated, unkempt)
    - (3) Cringes when physically approached, seems unduly afraid
    - (4) Responses indicate avoidance of punishment rather than gaining reward
    - (5) Has excessive interest in sexual matters; has sexually transmitted infection
  - b. Parental behavior
    - (1) Offer inconsistent stories explaining injuries
    - (2) Emotional response is inconsistent with degree of injury
    - (3) May resist or fail to be present for questioning
2. Protect from further abuse
3. Know child abuse laws; report suspected abuse/neglect to designated authority
4. Provide consistent caregiver
5. Monitor when parents or others visit
6. Help parents to
  - a. Address their dependency needs
  - b. Learn to control frustration through other outlets
  - c. Learn about childhood growth and development, expected behavioral characteristics, realistic expectations
  - d. Appropriate modes of limit setting and discipline
7. Use therapeutic play with child to help express feelings

8. Provide emotional support and therapy; abused children may grow to be abusive parents
9. Refer family for group therapy, home visits, foster grandparent visits

## Evaluation/Outcomes

1. Child remains free from injury or neglect
2. Parents demonstrate effective parenting activities

## Fractures throughout Childhood

(See [Chapter 11](#), Nursing Care of Clients With Neuromusculoskeletal System Disorder: Fractures of the Extremities, for additional information)

### Data Base

- A Interruption in the integrity of a bone
- B Most frequent extremity fractured is forearm; especially radius from extending palm to break a fall
- C Minimal injury to surrounding tissue; rapid healing (rapidity inversely related to age)
- D Types of fractures ([Figure 31-2](#): Common types of fractures in children)

**FIGURE 31-2** Common types of fractures in children. (Modified from Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children*, ed 9, St. Louis, 2011, Mosby.)

1. Incomplete (bones in young children are soft and not fully mineralized)
    - a. Bone deformation: bone is bent, not broken
    - b. Buckle: bone is compressed; appears as bulge
    - c. Greenstick: incomplete break with bending of a long bone
  2. Complete: bone fragments divided; may be connected by periosteal hinge; subtypes include transverse, oblique, spiral
- E Clinical findings
1. Generalized swelling
  2. Pain or tenderness

3. Diminished function of part

F Therapeutic interventions

1. Splints

2. Casts (hard or soft): promote bone alignment to prevent further damage

3. Surgery: internal or external fixation

## ***Nursing Care of Children with Fractures***

### **Assessment/Analysis**

1. The five Ps associated with neurovascular assessment

a. Pain and point of tenderness

b. Pulselessness distal to fracture site (late and ominous sign)

c. Pallor

d. Paresthesia distal to fracture site

e. Paralysis; lack of movement distal to fracture site

2. Cause of injury

### **Planning/Implementation**

1. Use age-appropriate pain rating scale and medicate appropriately

2. Monitor neurovascular status of distal extremity; avoid using affected extremity to monitor vital signs

3. Allow cast to dry by exposing to air; avoid using finger tips to handle moist cast

4. Provide age-appropriate activity for distraction and entertainment

5. Monitor operative site(s) of internal or external fixation

6. Maintain functional alignment with supportive devices

### **Evaluation/Outcomes**

1. Maintains neurovascular status in affected extremity

2. Experiences minimal discomfort

3. Maintains skin integrity

4. Regains tone and flexibility in muscles and joints

5. Plays and interacts with others

## **Cognitive Impairment (Mental Retardation)**

### ***Data Base***

A General term encompassing any type of intellectual difficulty

B Classification

1. Normal: 90 to 110 intelligence quotient (IQ)

2. Borderline: 71 to 89 IQ

3. Mild: 50/55 to 70 IQ

a. Can achieve mental age of 8 to 12 years

b. Educable: can learn to read, write, do arithmetic, achieve vocational skill, function in society

4. Moderate: 35/40 to 50/55 IQ

a. Can achieve mental age of 3 to 7 years

b. Trainable: can learn activities of daily living and social skills; can be trained to work in sheltered workshop

5. Severe: 20/25 to 35/40 IQ

a. Can achieve mental age of birth to 2 years

b. Barely trainable; totally dependent on others and in need of custodial care

6. Profound: below 20/25 IQ

a. May attain mental age of young infant

b. Requires total care

C Risk Factors

1. Genetic

a. Chromosomal abnormalities from maternal exposure to radiation, viral infection, chemicals; parental age

b. Genetic mutations (e.g., Down syndrome, fragile X syndrome)

c. Metabolic or endocrine disorders (e.g., untreated phenylketonuria [PKU], hypothyroidism)

d. Sibling with mental retardation

2. Congenital

a. Maternal infection (e.g., rubella; syphilis)

b. Maternal drug or alcohol consumption (e.g., fetal alcohol syndrome)

c. Cerebrospinal and craniofacial malformations (e.g., microcephaly, hydrocephalus, myelomeningocele, craniostenosis)

3. Perinatal

a. Low birth weight, prematurity, postmaturity

b. Intracranial hemorrhage, anoxia (e.g., cerebral palsy)

c. Physical injury (e.g., precipitous birth, cephalopelvic disproportion)

d. Kernicterus (caused by untreated Rh incompatibility)

4. Environmental

a. Deprivation associated with parental behaviors

b. Chronic lead ingestion

D Conditions that may lead to a false diagnosis of mental retardation

1. Emotional disturbance (e.g., maternal deprivation)

2. Sensory problems (e.g., deafness, blindness)

3. Cerebral dysfunctions (e.g., cerebral palsy, learning disorders, hyperkinesia, seizure disorders)

E Clinical findings

1. Delayed milestones: infant fails to suck; head lag after 4 to 6 months of age; slow in learning self-help; slow to respond to new stimuli; slow or absent speech development

2. Mental abilities: concrete; abstract ability is limited; may repeat words (echolalia)

3. Lacks power of self-appraisal; does not learn from errors

4. Cannot follow complex instructions; learns rote responses and socially acceptable behavior
  5. Does not relate to peers; more secure with adults; comforted by physical touch
  6. Short attention span; usually attracted to music
- F Therapeutic interventions
1. Prevention of causes that damage brain cells (e.g., hypoxia, untreated hypothyroidism or PKU)
  2. Early identification
  3. Minimization of long-term consequences (e.g., treatment of associated problems, infant stimulation, parental education)

## ***Nursing Care of Children Who Are Cognitively Impaired***

### **Assessment/Analysis**

1. Developmental screening
2. Associated illnesses/risk factors
3. Parental perception of developmental delays

### **Planning/Implementation**

1. Base care on developmental, not chronologic, age
  - a. Educate parents regarding developmental age
  - b. Adolescence: explain changes (e.g., physical, sexual feelings) appropriate to mental capacity
2. Set realistic goals; teach by simple steps for habit formation rather than for understanding or transference of learning
  - a. Break down process of learning skills into simple steps that can be achieved; ensure each step is learned completely before teaching next step
  - b. Use behavior modification; praise accomplishments to develop self-esteem
  - c. Keep discipline simple, geared toward learning acceptable behavior rather than developing judgment
  - d. Employ routines and simple repetitive tasks; base hospital activities on child's routine schedule

### **Evaluation/Outcomes**

1. Performs activities of daily living at optimum level
2. Family members make realistic decisions based on child's needs and abilities

## **Cerebral Palsy (CP)**

### ***Data Base***

A Impairment in area of brain that controls voluntary movement and muscle tone; type and extent of disability varies from mild to profound (clumsiness to quadriplegia);

associated with sensory, intellectual, emotional, seizure disorders

## B Risk factors

1. Prenatal brain abnormalities: estimated to be most common cause
2. Prematurity: increased prevalence in infants born before 36 weeks' gestation weighing less than 2000 g (4.4 lb)
3. Anoxia of brain: variety of insults at or near time of birth
4. Trauma: brain attack (cerebral vascular accident)

## C Classification

1. Spastic (pyramidal): persistent primitive reflexes; increased muscle tone (hypertonia)
  - a. Hemiplegia: weakness and poor motor control of one arm and one leg on same side of body
  - b. Diplegia: paralysis of upper or lower extremities
  - c. Monoplegia: paralysis of 1 limb
  - d. Triplegia: paralysis of 3 limbs
  - e. Quadriplegia: paralysis of all extremities
2. Dyskinetic (nonspastic, extrapyramidal)
  - a. Athetoid (Chorea): involuntary, writhing movements
  - b. Dystonic: slow, twisting movements
3. Ataxic (nonspastic, extrapyramidal): wide-based gait; difficulty reaching for objects
4. Mixed type: combined spastic and dyskinetic
5. Hypotonic: limp

## D Characteristics

1. Evident before 3 years of age
2. Nonprogressive, but persists throughout life
3. Inability to achieve or delayed developmental milestones
4. May or may not have intellectual disability
  - a. Problems with intellectual functioning (e.g., thinking, problem solving): affect more than 50%
  - b. Average intellectual ability with learning disorders
  - c. Mental retardation
5. Seizures: affect 33%
6. Visual difficulties: more than 75% have strabismus; eye muscle incoordination
7. Difficulty speaking; language deficit
8. Contractures: common with spasticity
9. Oral disease: inadequate oral hygiene; enamel defects; side effects of medications

## E Clinical findings

1. Difficulty feeding, especially sucking and swallowing; gastroesophageal reflux
2. Delayed motor development; abnormal motor performance; asymmetry of motion or contour of body
3. Muscular abnormalities; alteration in muscle tone
4. Abnormal posture
5. Delayed speech development
6. Reflex abnormalities (e.g., hyperreflexia)

## F Therapeutic interventions

1. Early treatment; multidisciplinary approach
2. Mobility devices (e.g., braces, casts)
3. Surgery to correct spastic muscle imbalance
4. Medications
  - a. Skeletal muscle relaxants; anticonvulsants; intrathecal baclofen (Lioresal) administration using implanted pump
  - b. Analgesics for muscle spasm pain
5. Physical, occupational, and speech therapy

## ***Nursing Care of Children with Cerebral Palsy***

### **Assessment/Analysis**

1. Prenatal/perinatal risk factors
2. Ineffective feeding
3. Muscles for rigidity, tenseness, hypotonia
4. Delayed developmental milestones

### **Planning/Implementation**

1. Promote nutrition and facilitate feeding
  - a. Expect drooling from swallowing difficulty
  - b. Encourage self-feeding (e.g., offer spoon and blunt fork, attach plate to table)
  - c. Offer high-calorie diet for excessive energy expenditure, high-protein for muscle activity, increased vitamins (especially B<sub>6</sub>) for amino acid metabolism
2. Promote relaxation
  - a. Provide rest periods in quiet environment
  - b. Limit energy expenditure with quiet activities
3. Maintain safety
  - a. Protect from accidents resulting from altered sensation, impaired balance, lack of muscle control
  - b. Provide helmet, if necessary, for protection against head injuries
  - c. Provide physical supports/restraint as necessary
4. Promote play
  - a. Ensure educational value appropriate to developmental level and ability
  - b. Avoid overstimulation
5. Promote elimination
  - a. Teach parents that toilet training difficulties are associated with impaired muscle control
  - b. Provide special bowel and bladder training
6. Facilitate speech development
  - a. Teach parents that word mispronunciation is associated with incoordination of lips, tongue, cheeks, larynx, and impaired control of diaphragm

b. Refer for speech therapy

7. Promote respiratory status

a. Teach parents that respiratory tract infections are associated with impaired control of intercostal muscles and diaphragm; protect child from people with infections, crowds

b. Monitor for manifestations of aspiration pneumonia

8. Promote healthy dentition

a. Teach parents: inability to control muscles affect development and alignment of teeth; brush child's teeth if muscular dysfunction impairs self-care

b. Encourage continued dental supervision; prone to dental caries

9. Promote visual acuity

a. Teach parents that strabismus and refractive errors may be related to impaired muscular control

b. Monitor for and report visual disorders to prevent further problems (e.g., amblyopia)

c. Encourage routine visits to health care provider for diagnosis and treatment

10. Promote optimum hearing

a. Teach parents that hearing problems depend on area of brain damage

b. Encourage parents to have child's hearing checked periodically

11. Promote mobility

a. Perform passive and encourage active range-of-motion exercises to prevent contractures, stretch ligaments and muscles

b. Encourage wearing leg braces, if prescribed, to maintain functional alignment and prevent deformities

c. Encourage use of assistive devices (e.g., forearm crutches, wheeled walker) to promote stability

12. Provide emotional support to parents

a. Help to cope with lifelong disability and loss of idealized child

b. Explain need to avoid overprotection; set limits when necessary; be consistent when disciplining

c. Explain importance of allowing time for healthy siblings

## Evaluation/Outcomes

1. Remains safe from injury

2. Consumes adequate nutrients for growth

3. Communicates needs to caregivers

4. Performs self-care activities within capabilities

5. Exhibits behavior indicative of positive self-image

6. Parents and siblings verbalize effect of child's disability on family

## Hearing Impairment

### Data Base

A Disability ranges from mild hearing loss to deafness

B Risk factors

1. Genetic: family history of childhood hearing impairment; Down syndrome
2. Prenatal: anatomic malformations; cerebral palsy
3. Perinatal: low birth weight; severe asphyxia; maternal infection (e.g., cytomegalovirus, rubella, herpes, syphilis, toxoplasmosis)
4. Postnatal: chronic ear infections; bacterial meningitis; ototoxic medications (e.g., gentamicin)
5. Environmental: continuous exposure to loud noise (e.g., equipment in a neonatal intensive care unit, gunfire); continuous exposure to less intense noises (e.g., music)

C Types of deficit

1. Conductive: involves transmission of sound to middle ear
  - a. Interferes with volume of sound
  - b. Most common of all types of hearing loss; most frequent cause is recurrent otitis media
2. Sensorineural: involves inner ear structures and auditory nerve
  - a. Distorts clarity of words; has difficulty discriminating sounds
  - b. Causes: kernicterus, ototoxic drugs, excessive noise exposure
3. Mixed conductive-sensorineural
4. Central auditory imperception
  - a. Unexplained by other three causes
  - b. Hears but does not understand

D Classification

1. Slight (16 to 25 decibels): difficulty hearing faint or distant speech; may be unaware of problem; may have problems in school; no speech defects
2. Mild to moderate (26 to 55 decibels): may have speech difficulties; understands face-to-face conversational speech at 3 to 5 feet
3. Moderately severe (56 to 70 decibels): unable to understand conversational speech unless loud; difficulty with group or classroom discussion
4. Severe (71 to 90 decibels): may hear loud noises if nearby; may be able to identify loud environmental noises; requires speech training
5. Profound (greater than 90 decibels): may hear only loud noises; requires extensive speech training

E Clinical findings

1. Infant
  - a. Lack of Moro reflex in response to sharp clap; failure to respond to loud noise
  - b. Failure to locate source of sound at 2 to 3 feet after 6 months of age
  - c. Absence of babble by 7 months of age
  - d. Inability to understand words or phrases by 12 months of age
2. Toddler
  - a. Use of gestures rather than verbalization to establish wants, especially after 15 months of age
  - b. History of frequent respiratory tract infections and otitis media

3. Older children: monotone quality to voice; unintelligible speech; inattentive; shy; withdrawn; tinnitus

#### F Therapeutic interventions

1. Conductive loss: tympanostomy tubes for chronic otitis media; hearing aids to amplify sounds
2. Sensorineural: cochlear implants (hearing aids of less value)
3. Central auditory imperception: may not respond to any therapy
4. Speech therapy
5. Alternative modes of communication (e.g., signing, lip reading)

### ***Nursing Care of Children with Impaired Hearing***

#### **Assessment/Analysis**

1. Prenatal and family history
2. Early manifestations at newborn assessment
3. Response to auditory stimuli
4. Failure to develop understandable speech by 24 months

#### **Planning/Implementation**

1. Use face-to-face communication to facilitate lip reading; have adequate light on speaker's face
2. Be at face level when communicating; speak toward unaffected ear; do not walk or turn away while talking
3. Enunciate and articulate carefully; do not talk too loudly, especially if loss is sensorineural
4. Use facial expressions (verbal intonations are not communicated)
5. Encourage active play to express feelings and build self-confidence
6. Educate others on how best to communicate with child
7. Refer to other health care providers/agencies (e.g., audiologist, speech therapist, teachers of sign language and lip reading)

#### **Evaluation/Outcomes**

1. Remains safe
2. Uses hearing aid when indicated
3. Engages in activities appropriate to developmental level
4. Child/family interact with each other effectively
5. Uses community resources to improve communication skills

### **Visual Impairment**

#### ***Data Base***

A Loss of vision that cannot be corrected with prescription glasses

1. School vision (partially sighted): visual acuity between 20/70 and 20/200; able to read print in school textbooks
  2. Legal blindness: better eye has visual acuity of 20/200 or less, or visual field of 20 degrees or less; eligible for special services
- B Risk factors**
1. Prenatal: maternal infections (e.g., herpes, rubella, gonococci, chlamydia); congenital cataracts
  2. Postnatal: retinopathy of prematurity; infections (e.g., meningitis); trauma; tumor; type 1 diabetes (vascular complication)
- C Refractive deficits**
1. Myopia (nearsightedness): image projected in front of retina
  2. Hyperopia (farsightedness): image projected behind retina
  3. Astigmatism: light rays bend in different directions
  4. Anisometropia: different refraction in each eye
- D Amblyopia ("lazy eye"): inadequate vision in one eye**
1. Weak eye loses vision from disuse
  2. Should be corrected before 4 years of age
- E Strabismus ("cross eye"): malalignment of eye; imbalance of extraocular muscles, causing physiologic eye incoordination**
1. Esotropia: inward deviation
  2. Exotropia: outward deviation
- F Clinical findings**
1. Delayed motor development
  2. Rocking for sensory stimulation
  3. Squinting; rubbing eyes; sitting close to television; holding book close to face
  4. Clumsiness (e.g., bumping into objects)
- G Therapeutic interventions**
1. Strabismus and cataracts: surgical intervention
  2. Corrective lenses
  3. Amblyopia: patch on unaffected eye to force weak eye to fixate; surgery to lengthen or shorten extraocular muscles

## ***Nursing Care of Children with Impaired Vision***

### **Assessment/Analysis**

1. History of visual deficit
2. Early signs of visual problems
  - a. Behavior indicative of vision loss (e.g., clumsiness, squinting)
  - b. Eye incoordination (e.g., strabismus, amblyopia)
  - c. Decreased visual acuity

### **Planning/Implementation**

1. Talk clearly; use noise to locate speaker
2. Help to learn through other senses (e.g., touch) through play activities
3. Facilitate eating
  - a. Arrange food on plate at clock hours and teach its location
  - b. Provide finger foods when possible
  - c. Provide light spoon and deep bowl so that weight of food can be felt on spoon
4. Encourage parents to follow treatments for strabismus and other visual problems

## Evaluation/Outcomes

1. Wears corrective devices (e.g., eyeglasses, patch on weak eye)
2. Remains free from injury
3. Engages in appropriate activities for level of development
4. Child and family members demonstrate positive relationship

## Celiac Disease

### Data Base

A Gluten-sensitive enteropathy; immunologically mediated small intestine enteropathy; mucosal lesions show humoral and cell-mediated immunologic stimulation

1. Inability to digest gluten, found mostly in wheat, rye, oats, and barley
2. Malabsorption syndrome: chronic diarrhea and malabsorption of fluid and nutrients, resulting in failure to thrive
3. Progression of illness
  - a. Early stage: fat absorption affected
  - b. Later stage: protein, carbohydrate, mineral, and electrolyte absorption affected; growth failure and muscle wasting
4. Full remission after initiation of gluten-free diet

### B Incidence

1. Common lifelong disorder affecting 1% of total population
2. Identified several months after introduction of gluten-containing grain into diet; usually between 1 and 5 years of age; can occur at any age; many never identified; identification is increasing

C Risk factors: may be interaction of inherited predisposition and environment

### D Clinical findings

1. Progressive malnutrition: anorexia; muscle wasting; distended abdomen
2. Secondary deficiencies: anemia; rickets
3. Behavioral changes: irritability; fretfulness; apathy
4. Stools: greasy; pale; foul-smelling
5. Celiac crisis: severe episode of dehydration and acidosis from diarrhea

### E Therapeutic intervention: dietary

1. Gluten free (e.g., no wheat, rye, oats, or barley)
2. High in calories and protein

3. Low fat
4. Small, frequent feedings; adequate fluids
5. Vitamin supplements in water-miscible form; supplemental iron

## ***Nursing Care of Children with Celiac Disease***

### **Assessment/Analysis**

1. Nutritional status
2. Parent/child knowledge of illness and dietary regimen

### **Planning/Implementation**

1. Teach parents and child about dietary modifications
  - a. Restricted foods: wheat, rye, oats, barley
  - b. Permitted substitutes: corn, rice, millet, potatoes
  - c. Read nutrition labels on prepared foods; some state “Gluten Free”
2. Provide support to facilitate adherence to dietary regimen (e.g., gluten free recipes; specialty food stores)
3. Explain need for continued health supervision

### **Evaluation/Outcomes**

1. Parent/child verbalizes correct dietary information
2. Consumes adequate calories for growth and development
3. Remains free of celiac-induced diarrhea

## **Cystic Fibrosis (CF)**

### ***Data Base***

A Autosomal recessive disorder affecting exocrine (mucus-producing) glands

1. Reduces ability of epithelial cells in airways and pancreas to transport chloride; abnormal transport of sodium and chloride across epithelium leads to increased viscosity of airway mucus, abnormal mucociliary clearance, and lung disease
2. Elevation in sweat electrolytes; sodium and chloride levels are three to five times higher than expected; sweat chloride levels more than 60 mEq/L are diagnostic

B Organs affected by increased viscosity of mucous gland secretions

1. Pancreas: becomes fibrotic; decreased production of pancreatic enzymes (lipase, trypsin, chymotrypsin, amylase) that affect digestion and absorption of foods
2. Respiratory system: viscous mucus in trachea, bronchi, and bronchioles interferes with expiration, predisposing to emphysema
3. Liver: possible cirrhosis from biliary obstruction, malnutrition, or infection; portal hypertension predisposes to esophageal varices
4. Rectum: may prolapse
5. Sexual organs: may become infertile (more common in males)

C Incidence: most common lethal genetic disease of childhood

1. About 1 in 29 Caucasian children are symptom-free carriers
2. 35% of adults with CF between ages 20 and 29 have diabetes resulting from pancreatic involvement

D Clinical findings

1. Infancy
  - a. Meconium ileus at birth (about 15%); abdominal distention
  - b. Failure to regain expected 10% weight loss at birth
  - c. Cough or wheezing during first 6 months of age
2. Respiratory involvement
  - a. Frequent pulmonary infections
  - b. Barrel-shaped chest (hyperaeration of functioning alveoli), cyanosis, clubbing of fingers
3. GI involvement
  - a. Bulk of feces is two or three times expected amount because of undigested food (e.g., unabsorbed fats, proteins)
  - b. As solid foods are added to diet, bulky stools become frothy and foul-smelling
4. Cardiac involvement: enlargement of heart (right ventricular hypertrophy [cor pulmonale])

E Therapeutic interventions

1. Respiratory problems: chest physiotherapy; bronchodilators; antibiotic therapy as indicated; avoidance of antitussives and antihistamines
2. GI problems
  - a. Pancreatic enzymes; vitamin supplements; water-miscible forms of fat-soluble vitamins (A, D, E, K)
  - b. Balanced nutritional intake
  - c. Caloric intake should be 150% to 200% more than that of healthy child

## ***Nursing Care of Children with Cystic Fibrosis***

### **Assessment/Analysis**

1. Respiratory status
2. GI status
3. Height and weight compared with expected range
4. Cognitive level
5. Effect of chronic illness on social status

### **Planning/Implementation**

1. Prevent respiratory tract infections
  - a. Postural drainage, percussion, and vibration between feedings
  - b. Administer prescribed expectorants, antibiotics, aerosol therapy
2. Promote optimum nutrition

- a. Administer prescribed pancreatic enzymes at beginning of meal with cold food (hot food breaks down enzymes)
- b. Administer prescribed vitamin supplements; fat-soluble vitamins in water-miscible form
- c. Encourage high-protein, moderate-fat, high-calorie diet
3. Promote mobility and activity as tolerated
4. Promote positive body image
  - a. Help to cope with barrel-shaped chest, low weight, thin extremities, bluish coloring, odor of stools
  - b. Encourage selection of clothes that compensate for protuberant abdomen and emaciated extremities
5. Provide emotional support/counseling for child and family
  - a. Help to cope with long-term problem that causes financial and emotional stresses
  - b. Help parents to recognize attention-getting behaviors (e.g., wheezing) and to use consistent discipline
  - c. Encourage family to join a support group
  - d. Refer family for genetic counseling if future pregnancy is planned

## Evaluation/Outcomes

1. Engages in activities that maintain balance between oxygen supply and demand
2. Maintains patent airway
3. Consumes adequate calories for growth and development
4. Family members demonstrate ability to care for child
5. Continues chest physiotherapy
6. Continues health care supervision

## Iron Deficiency Anemia (Dietary)

### **Data Base**

A Inadequate intake of dietary iron

1. Infant: usually has maternal iron reserve for 6 months
2. Preterm infant: lacks sufficient reserves; usually depleted by 2 to 3 months of age
3. Child receiving only milk: has no source of iron ("milk babies")

B Insidious onset: usually diagnosed because of infection or chronic GI problems

C Incidence: most prevalent nutritional disorder among children in United States; decreasing because Women, Infants, and Children (WIC) program provides iron-fortified formula for 1 year and hemoglobin screenings during early childhood

D Clinical findings

1. Hemoglobin level below expected level for age
2. Pallor; weakness; tachycardia; dizziness; cardiac decompensation if severe
3. Slow motor development; decreased muscle tone
4. Weight: may be underweight or overweight (chubby, "milk baby" appearance)

## E Therapeutic interventions

1. Dietary sources high in iron
  - a. Iron-fortified formula
  - b. Iron-fortified infant cereal
2. Iron replacement
  - a. Oral iron sources
    - (1) Ferrous sulfate: most absorbable form of iron
    - (2) Adverse effects: nausea and vomiting
  - b. Parenteral iron sources for iron malabsorption or chronic hemoglobinuria
    - (1) Parenteral iron-dextran
    - (2) Adverse effects: tissue staining; fever; lymphadenopathy; nausea; vomiting; arthralgia; urticaria; peripheral vascular failure; anaphylaxis; secondary hematochromatosis
3. Blood transfusions for intractable anemia

## ***Nursing Care of Children with Dietary Iron Deficiency Anemia***

### **Assessment/Analysis**

1. Nutritional history and status
2. History of chronic infection
3. Eating habits (e.g., pica, ingestion of lead, foods other than milk)

### **Planning/Implementation**

1. Provide prevention education
  - a. Teach pregnant women importance of iron intake
  - b. Encourage parents to
    - (1) Feed iron-fortified infant formula or breastfeed
    - (2) Feed iron-fortified infant cereal and chopped meat
  - c. Teach parents
    - (1) Foods high in iron; nonmeat sources of iron for vegetarians
    - (2) About nutrients essential for RBC production (e.g., protein, vitamin B<sub>12</sub>, folic acid, ascorbic acid)
2. Teach parents about administration of supplemental iron
  - a. Some liquid preparations stain teeth; use straw for administration
  - b. Stools are blackish green
  - c. Gastric irritation or constipation may occur
  - d. Vitamin C and folic acid aid iron absorption

### **Evaluation/Outcomes**

1. Engages in appropriate activities without fatigue
2. Consumes adequate nutrients for correction of anemia
3. Parents verbalize dietary requirements of child

# Sickle Cell Anemia (HbS)

## Data Base

A Genetic disorder affecting hemoglobin synthesis

1. Substitution of amino acid valine for glutamic acid in beta chain of hemoglobin
2. Defective hemoglobin causes RBCs to become sickle-shaped and clump together under reduced oxygen tension
3. During newborn period, high levels of fetal hemoglobin prevent sickling
4. Fetal hemoglobin decreases during first year of life, and number of sickling episodes increase

B Classification

1. Sickle cell anemia: homozygous for sickle cell gene
2. Sickle cell trait: heterozygous for sickle cell gene; have same basic defect, but only 35% to 45% of total hemoglobin is sickle hemoglobin (HbS)

C Clinical findings

1. Screening: sickle turbidity test (Sickledex) with finger-stick blood determines presence of HbS
2. Confirmation of diagnosis: hemoglobin electrophoresis
3. Vaso-occlusive crisis (VOC): painful episode; most common; not life-threatening
  - a. Sickled cells obstruct blood vessels, causing occlusion, ischemia, potential necrosis
  - b. Fever, acute abdominal pain (visceral hypoxia), hand-foot syndrome, priapism, arthralgia without exacerbation of anemia
4. Sequestration crisis
  - a. Large quantity of blood pools in spleen, causing precipitous drop in blood pressure and ultimately shock
  - b. Acute episode occurs between 8 months and 5 years of age; can result in death from anemia and cardiovascular collapse
  - c. Multiple splenic infarctions result in functional asplenia
5. Aplastic crisis: diminished RBC production
  - a. May be triggered by viral or other infection
  - b. Profound anemia results from rapid destruction of RBCs combined with decreased production
6. Hyperhemolytic crisis: increased rate of RBC destruction
  - a. Anemia, jaundice, reticulocytosis
  - b. Rare complication associated with concurrent disorder (e.g., transfusion reactions, viral infection, glucose-6-phosphate dehydrogenase [G6PD] deficiency)
7. Acute chest syndrome; pulmonary infiltrate
  - a. Pneumonia-like manifestations
  - b. Chest pain, fever, cough, tachypnea, wheezing, hypoxia
8. Brain attack (cerebral vascular accident): sickled cells block major blood vessels in brain
  - a. Cerebral infarction, resulting in varied degrees of brain damage

b. Repeat brain attacks in 60% of children who have experienced previous attack

#### D Therapeutic interventions

##### 1. Prevention of sickling phenomenon

- a. Adequate oxygenation
- b. Adequate hydration
- c. Administration of hydroxyurea to increase fetal hemoglobin
- d. Blood transfusions to decrease production of cells with sickle hemoglobin
- e. Immediate treatment of respiratory tract infections

##### 2. Treatment of crisis

- a. Pain management; rest
- b. Hydration/electrolyte replacement
- c. Antibiotic therapy
- d. Blood products

## ***Nursing Care of Children with Sickle Cell Anemia***

### **Assessment/Analysis**

- 1. Vital signs, neurologic signs
- 2. Vision/hearing
- 3. Location and intensity of pain
- 4. Fluid balance
- 5. Spleen size

### **Planning/Implementation**

- 1. Avoid dehydration to prevent rapid thrombus formation
  - a. Calculate fluid needs according to body weight (130 to 200 mL/kg)
  - b. Increase fluids during crisis especially if febrile
- 2. Prevent crisis
  - a. Avoid dehydration and other conditions that cause stress on body (e.g., infection, nonpressurized airplanes, high altitudes)
  - b. Administer prescribed medications: prophylactic pneumococcal, meningococcal, and *Haemophilus* flu vaccines; hepatitis B for those who did not receive it with routine immunizations; antibiotics for infections
- 3. Provide care during crisis
  - a. Provide adequate hydration (e.g., oral, parenteral therapy)
  - b. Ensure effective positioning (e.g., elevate head of bed, support joints); move carefully while supporting joints
  - c. Encourage exercise as tolerated to prevent thrombus formation and respiratory problems
  - d. Ensure adequate oxygenation
  - e. Control pain: use comfort measures; administer prescribed opioids; schedule medication administration to prevent onset of pain; apply prescribed warm soaks

to joints

f. Administer prescribed blood transfusions for severe anemia

4. Refer for genetic counseling

a. Inform people at risk to obtain genetic counseling (e.g., disorder mostly of people of African and Mediterranean descent)

b. Teach parents degree of risk for having other children with trait or disease (e.g., if both parents are carriers, each pregnancy has 25% chance of producing a child with the disease)

5. Support parents

a. Lifelong problem

b. Multiple remissions and exacerbations

## Evaluation/Outcomes

1. Reports minimal pain

2. Verbalizes feelings about disease process

3. Demonstrates behaviors reflective of a positive body image

4. Remains free from crisis

## β-Thalassemia (Cooley Anemia)

### Data Base

A Autosomal disorder most common in individuals of Mediterranean descent; varied expressivity

1. Deficient synthesis of β-chain polypeptides

2. Decreased production rate of globin molecule

B Classification of thalassemia

1. Minor: asymptomatic carrier

2. Trait: heterozygous; mild microcytic anemia

3. Intermedia: splenomegaly; moderate to severe anemia

4. Major: severe anemia; requires transfusions to sustain life

C Clinical findings

1. Severe anemia

2. Unexplained fever, headache

3. Anorexia, impaired feeding

4. Enlarged abdomen, splenomegaly, hepatomegaly

5. Impaired physical growth

6. Listlessness, exercise intolerance

7. Bronze skin color from hemosiderosis

D Therapeutic interventions

1. Blood transfusions to maintain adequate hemoglobin levels; may result in:

a. Hemosiderosis (excessive iron storage in body tissues, especially spleen, liver, lymph glands, heart, pancreas)

- b. Hemochromatosis (excessive iron storage with resultant cellular damage)
- 2. Iron-chelating agents (e.g., deferoxamine (Desferal) to reduce iron storage
- 3. Splenectomy: to reduce number of transfusions
- 4. Prophylactic antibiotics to reduce risk of overwhelming infection
- 5. Bone marrow transplantation

## ***Nursing Care of Children with $\beta$ -Thalassemia***

### **Assessment/Analysis**

- 1. Family history, especially if Mediterranean descent (e.g., Italian, Greek, Syrian)
- 2. Laboratory reports for significant anemia
- 3. Cardiovascular status

### **Planning/Implementation**

- 1. Prevent infection
  - a. Teach to avoid contact with persons who have infections
  - b. Ensure immunizations are current
  - c. Administer prophylactic antibiotics, if prescribed
- 2. Prevent complications
  - a. Monitor during transfusions; stop infusion if transfusion reaction occurs
  - b. Administer prescribed chelating agents and folic acid
  - c. Teach to avoid activities that increase risk for fractures
- 3. Prepare child and family for bone marrow transplantation; hematopoietic stem cell transplantation (HSCT) most successful, 75% chance of cure
  - a. Encourage participation in support group
  - b. Identify family support
  - c. Provide education on preprocedure and postprocedure periods
- 4. Assist in coping with disorder and its effects
  - a. Explore feelings about being different from other children
  - b. Emphasize abilities; focus on realistic endeavors
  - c. Encourage quiet activities, creative efforts, “thinking” games
  - d. Encourage interaction with peers; introduce to children who have adjusted to this or similar disorder
  - e. Help schedule therapies so they do not interfere with regular activities and social interactions
- 5. Support parents
  - a. Explore feelings regarding hereditary nature of disorder
  - b. Emphasize need for child to lead as active a life as possible
  - c. Explain need for consistency when setting limits and disciplining
  - d. Help family cope with potentially fatal nature of the illness
- 6. Refer for genetic counseling if planning pregnancy; reinforce and clarify counseling information

## Evaluation/Outcomes

1. Participates in appropriate activities for age and energy level
2. Verbalizes feelings about disease/hospitalization
3. Demonstrates behaviors reflective of positive body image
4. Parents demonstrate ability to care for child
5. Parents verbalize feelings and concerns

## Emotional Disorders

For common emotional disorders of the toddler, see [Chapter 17](#), Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence

# CHAPTER 32

# Nursing Care of Preschoolers

---

# Growth and Development

## Developmental Timetable

### **Three Years**

#### A Physical

1. Weight: gains 1.8 to 2.7 kg (4 to 6 lb)
2. Height: grows 7.5 cm (3 inches)

#### B Motor

1. Jumps off bottom step; walks upstairs alternating feet; stands on one foot
2. Rides tricycle using pedals
3. Constructs three-block bridge; builds tower of 9 or 10 cubes
4. Can unbutton front or side button; uses spoon
5. Usually toilet trained at night

#### C Sensory: visual acuity 20/30

#### D Vocalization and socialization

1. Vocabulary: about 900 words; uses three- to four-word sentences; uses plurals; may have hesitation in speech pattern; may stutter
2. Begins to understand sharing and taking turns

#### E Mental abilities

1. Begins to understand past, present, future, or other aspects of time
2. Enters stage of magical thinking

### **Four Years**

#### A Physical

1. Weight: increases similar to previous year
2. Height: doubles birth height

#### B Motor

1. Skips and hops on one foot; walks up and down stairs, alternating feet
2. Fastens buttons; laces shoes
3. Throws ball overhand; uses scissors to cut paper outline

#### C Vocalization and socialization

1. Vocabulary: 1500 words or more
2. May have imaginary companion
3. Can be selfish and impatient; takes pride in accomplishments; exaggerates; boasts; tattles on others
4. Constantly asks, "Why?"

#### D Mental abilities

1. Can repeat four numbers; learning number concept
2. Knows which is longer of two lines; inadequate space perception

### **Five Years**

A Physical: height and weight increase similar to previous year

B Motor

1. Gross motor abilities: well developed; balances on one foot for about 10 seconds; can jump rope, skip, and roller skate
2. Can draw picture of a person; prints first name and other words as learned
3. Dresses/washes self; learns to tie shoelaces

C Sensory

1. Color recognition well established
2. Potential for amblyopia to develop

D Vocalization and socialization

1. Vocabulary: about 2100 words; talks constantly; asks meaning of new words
2. Generally cooperative and sympathetic toward others
3. Basic personality structure well established

E Mental abilities (Piaget's phase of intuitive thought)

1. Begins to understand time (e.g., days are part of a week)
2. Begins to understand conversion of numbers
3. Has difficulty with abstract thought

# Health Promotion of Preschoolers

## Play (Cooperative Play)

- A Loosely organized group; membership and rules change readily
- B Learns to cope with reality and control feelings
- C Expresses emotions through actions rather than words
- D Physically oriented; imitative and imaginary; blurred line between reality and fantasy (e.g., may have imaginary playmates)
- E Tends to exaggerate; be impatient, noisy, selfish
- F Increased sharing and cooperation, especially 5-year-olds
- G Suggested toys
  1. Dress-up clothes, dolls, dollhouses, small trucks, animals, puppets
  2. Painting sets, coloring books, paste, cutout sets
  3. Illustrated books, puzzles with large pieces and varied shapes
  4. Tricycle, swing, slide, other playground equipment

## Nutrition and Injury Prevention during the Preschool Years

See [Chapter 31](#), Health Promotion of Toddlers Health Promotion of Toddlers, Childhood Nutrition and Injury Prevention during Toddlerhood

# Hospitalization of Preschoolers

## Data Base

A Child's reaction

1. Fears about body image and bodily harm greater than fear of separation
  2. Specific fears
    - a. Intrusive experiences (e.g., needles, thermometer, otoscope)
    - b. Punishment and rejection
    - c. Pain
    - d. Mutilation
  3. May regress to earlier developmental behaviors (e.g., bedwetting)
  4. Views death as temporary
  5. Cries when parents arrive/leave, but usually is calm when parents are not present
  6. May find physical examinations threatening; may require modification of procedures (e.g., handling equipment, having child sit/lay on parent's lap, allowing child to guide hand during assessment of abdomen)
- B Parental support: can prepare child for interventions because of increased cognitive and verbal ability

## General Nursing Care of Preschoolers

- A Begin preparing for elective hospitalization several days before, not sooner, because of vague concept of time; encourage to bring security article or special toy
- B Clarify cause and effect because of phenomenalistic thinking (in child's mind proximity of two events relates them to each other)
- C Keep verbal explanation as simple as possible and always honest
- D Explain routines but not everything at once, may be overwhelming; add details about procedures, drugs, surgery, based on cognitive level and past personal experiences
- E Initiate therapeutic play (e.g., dolls, puppets, make-believe equipment, dress-up doctor and nurse clothes) as an outlet for fear, anger, and hostility, as well as temporary escape from reality
- F Encourage parents to stay or visit as often as possible

# Health Problems Most Common in Preschoolers

## Leukemia

### *Data Base*

A Cancer of blood-forming organs; overproduction of immature, nonfunctioning leukocytes

B Incidence: most common type of childhood cancer; prognosis is improving

1. Peaks between 2 and 6 years of age
2. More common in males after 1 year of age

C Classification

1. Acute lymphoblastic leukemia (ALL): affects lymphocytes
  - a. Divided into subtypes based on morphological, cytochemical, and immunologic characteristics (T, B, null, and pre-B subtypes)
  - b. Five-year disease-free survival: 91% when diagnosed at younger than 5 years of age
2. Acute myelogenous leukemia (AML): acute nonlymphoblastic leukemia
  - a. Prognosis less favorable than ALL
  - b. Five-year survival: 61% when younger than 15 years of age at diagnosis

D Clinical findings

1. Decreased erythrocytes: anemia (e.g., pallor, weakness, irritability)
2. Decreased neutrophils: increased risk for infection (e.g., fever)
3. Decreased platelets: bleeding tendencies (e.g., ecchymoses, petechiae, bleeding gums and other mucous membranes)
4. Invasion of bone by leukemic cells: bone pain, fractures
5. Enlarged spleen, liver, and lymph glands
6. Intestinal inflammation: anorexia, vague abdominal pain
7. Later signs: central nervous system (CNS) involvement and frank hemorrhage

E Therapeutic interventions

1. Chemotherapy: protocols for AML and ALL are different; each protocol is based on child and disease factors (see [Chapter 3](#), Integral Aspects of Nursing Care, Neoplastic Disorders, Related Pharmacology)
  - a. Induction therapy for ALL: 4 to 6 weeks
    - (1) Corticosteroids: prednisone or dexamethasone
    - (2) Chemotherapeutic agents: based on subtypes
  - b. Intensification (consolidation) therapy for ALL: further decreases number of leukemic cells; combination of two or more drugs given in routine periodic stretches of administration (pulses) during first 6 months
  - c. CNS prophylactic therapy: irradiation and triple intrathecal medications (e.g., methotrexate, cytarabine, hydrocortisone) because leukemic cells invade brain; most antileukemic drugs do not pass blood-brain barrier
  - d. Maintenance therapy: preserves remission and further reduces number of leukemic cells

2. Hematopoietic stem cell transplantation (HSCT); not performed during first remission
3. Transfusions to replace and provide needed blood factors (e.g., RBCs, platelets, WBCs)

## ***Nursing Care of Children with Leukemia***

### **Assessment/Analysis**

1. Hematologic status: anemia (e.g., pallor, fatigue); thrombocytopenia (e.g., hematuria, bleeding gums); neutropenia (e.g., signs of infection)
2. Activity level
3. Complications of therapy/disease process
4. Family/child knowledge of disease process
5. Family support systems and coping strategies

### **Planning/Implementation**

1. Encourage adjustment to chronic illness; stress need for maintaining lifestyle
2. Identify perception of illness and death based on level of understanding
  - a. Preschooler: concept that death is reversible; greatest fear is separation
  - b. Young school age (6 to 9 years old): death is personified as individual who comes to remove child
  - c. Older school age (over 9 years old): adult concept of death as irreversible and inevitable
3. Support while experiencing side effects of medications; administer prescribed antiemetics (e.g., ondansetron) before chemotherapy
4. Encourage adequate nutrition despite anorexia; provide preferred foods, even hot dogs
5. Teach infection prevention: hand washing; avoiding contact with those with active infections; avoiding crowded places
6. Handle gently to reduce pain, risk for hemorrhage
7. Use pain rating scale and medicate appropriately
8. Provide gentle oral hygiene: use soft-tipped applicator; saline mouth rinses; offer soft, bland foods; cool liquids/food rather than cold or hot
9. Provide for frequent rest periods; quiet play

### **Evaluation/Outcomes**

1. Participates in developmental, age-appropriate activities
2. Remains comfortable
3. Consumes adequate calories for growth
4. Remains free from complications (e.g., infection, bleeding, anemia, impaired skin integrity)
5. Family and child discuss fears, concerns, and needs

## **Wilms Tumor (Nephroblastoma)**

## **Data Base**

A Most common malignant kidney neoplasm in children

B Incidence: estimated frequency is 9 per 1 million

1. More common in Caucasian children younger than 15 years old
2. Peak age at diagnosis between 3 and 4 years of age; 80% diagnosed by 5 years of age

C Risk factors.

1. Mode of familial inheritance (less than 2%): autosomal dominant; more common among siblings
2. May be associated with congenital anomalies

D Factors favoring positive prognosis

1. Stages I and II with localized tumor: 90% cured with multimodal therapy
2. Favorable histology of tumor
3. More than 12 months elapsed since first remission

E Clinical findings

1. Swelling or nontender abdominal mass; confined to one side of midline
2. Weight loss; fever; fatigue; malaise (with compression of abdominal organs)
3. Hematuria, caused by intrarenal hemorrhage; occurs in less than 25% of children
4. Hypertension occasionally occurs
5. Other findings associated with compression of neighboring organs or metastasis (e.g., lungs: cough, dyspnea, shortness of breath)

F Therapeutic interventions

1. Abdominal palpation and renal biopsy contraindicated to prevent rupture of encapsulated tumor
2. Surgery: scheduled soon after confirmation of mass
  - a. Tumor, kidney, and associated adrenal gland removed
  - b. Partial nephrectomy of contralateral kidney if affected
  - c. Regional lymph nodes and organs removed when indicated
3. Chemotherapy: indicated for all stages; continued for 6 to 15 months based on staging
4. Radiation therapy: to shrink large tumors before surgery; metastasis; residual disease after surgery; unfavorable cell type

## **Nursing Care of Children with Wilms Tumor**

### **Assessment/Analysis**

1. Observation of abdomen for mass or swelling
2. Laboratory results of RBCs for anemia
3. Weight loss
4. Signs and symptoms of compression of abdominal organs
5. Signs of metastasis to lung (e.g., dyspnea, cough, shortness of breath)

### **Planning/Implementation**

1. Preoperative

- a. Handle and bathe carefully to prevent abdominal trauma (may cause rupture of tumor capsule); place “Do not palpate abdomen” sign in appropriate place for professional staff, while maintaining confidentiality
  - b. Monitor blood pressure, I&O
  - c. Prepare parents and child for postoperative expectations (e.g., large dressing, drainage tube)
  - d. Begin teaching family about chemotherapy/radiation therapy
2. Postoperative
    - a. Monitor blood pressure, I&O
    - b. Use pain rating scale and medicate appropriately
    - c. Encourage to turn, cough, and deep breathe to prevent pulmonary complications
    - d. Teach parents to identify untoward reactions to chemotherapy and radiation therapy
3. See [Leukemia](#), Nursing Care

## Evaluation/Outcomes

1. Remains free from complications (e.g., infection)
2. Maintains blood pressure within acceptable range
3. Consumes adequate calories for growth
4. Child and family members discuss feelings and concerns

## Nephrotic Syndrome (Minimal Change Nephrotic Syndrome)

### Data Base

A Increased permeability of glomerular basement membrane to plasma albumin; cause unknown

B Incidence

1. Peaks between 2 and 7 years of age
2. Approximately 100,000 children affected yearly in North America
3. Males outnumber females 2:1

C Classification

1. Minimal change nephrotic syndrome (MCN): highest incidence (80%)
  - a. Glomerular membrane becomes permeable to protein (albumin) which leaks through membrane; serum albumin level is decreased
  - b. Capillary oncotic pressure is decreased
  - c. Hydrostatic pressure of tissues exceeds pull of capillary oncotic pressure; fluid accumulates in body cavities, especially abdomen (ascites)
2. Secondary nephrotic syndrome (e.g., glomerulonephritis)
3. Congenital nephrotic syndrome: usually death occurs by age 2 without dialysis or kidney transplant

D Clinical findings

1. Weight gain from fluid retention
  2. Edema (e.g., puffiness of face, periorbital edema on arising, generalized edema [anasarca], ascites, scrotal edema in males)
  3. Irritability
  4. Easily fatigued
  5. Blood pressure average for age or slightly decreased
  6. Oliguria; proteinuria
  7. Impending chronic renal failure (e.g., pale, muddy appearance, malaise, headache, muscle cramps, nausea, anorexia)
- E Therapeutic interventions
1. Nutrition
    - a. Sodium-restricted diet during periods of massive edema; edema does not resolve, but rate of increase may be limited
    - b. Diet adjusted to appetite
    - c. Protein restriction for renal failure and azotemia
  2. Categorization by response to steroid therapy
    - a. Steroid sensitive (20% to 40%): responds to single short course of steroids without evidence of relapse after cessation of therapy
    - b. Steroid dependent (60% to 80%): responds to steroids that can be tapered off completely; has remission when placed on steroids but tends to relapse on lower dosage; has three or more relapses in 6- to 12-month period
    - c. Steroid unresponsive or steroid resistant: does not respond to, or becomes resistant to, steroids during course of illness
  3. Corticosteroid therapy: predniSONE drug of choice
    - a. Response to therapy usually within 7 to 21 days; promotes diuresis
    - b. Lower dose or gradual discontinuation with satisfactory response
  4. Immunosuppressant therapy: if no response to steroids or for frequent relapses; cyclophosphamide (Cytosan) drug of choice

## ***Nursing Care of Children with Nephrotic Syndrome***

### **Assessment/Analysis**

1. Vital signs, particularly blood pressure
2. Fluid balance (e.g., daily weight, extent of edema, abdominal girth)
3. Urine studies (e.g., specific gravity, albumin)
4. Status of skin over edematous tissue
5. Side effects of steroids (e.g., edema, lability of mood, thin extremities, truncal obesity, signs of infection)

### **Planning/Implementation**

1. Prevent infection: both illness and drug therapy increase susceptibility
  - a. Protect from others who are ill

- b. Teach parents signs of impending infection; encourage to notify health care provider
- 2. Prevent malnutrition: caused by loss of protein and anorexia
  - a. Offer regular diet; encourage nutritious selection of foods
  - b. Restrict fluids if ordered; when indicated, teach child and parents about sodium-restricted diet
- 3. Promote respirations: respiratory difficulty caused by ascites
  - a. Place in seated position to decrease pressure against diaphragm
  - b. Monitor vital signs and respiratory status
- 4. Promote comfort: discomfort caused by edema, pressure areas
  - a. Provide some relief by repositioning, skin care
  - b. Support edematous genitalia
- 5. Provide emotional support: irritability and depression commonly occur
  - a. Help parents understand that mood swings are influenced by illness and corticosteroids
  - b. Support body image; impaired body image becomes problem as child gets older (appearance is more of a problem for parents)
  - c. Encourage to participate in own care
  - d. Encourage diversionary activities that provide satisfaction

## Evaluation/Outcomes

1. Engages in activities appropriate to age and abilities
2. Adheres to dietary regimen
3. Remains free from infection
4. Maintains skin integrity
5. Edema resolves
6. Child and family members discuss feelings and concerns

## Urinary Tract Infection (UTI)

### **Data Base**

A Microorganisms in urethra/bladder causing inflammation and infection; may progress to kidneys and/or blood (septicemia)

B Incidence: peaks at 2 to 6 years of age; after neonatal period females have 10 to 30 times greater likelihood of UTI

C Risk factor: lower urinary tract anatomy of females (short urethra, proximity of meatus to anus)

D Classification

1. Bacteriuria: asymptomatic or symptomatic
2. Recurrent UTI
3. Persistent UTI
4. Febrile UTI

5. Cystitis: bladder infection
6. Urethritis: urethral infection
7. Pyelonephritis: renal pelvis infection
8. Urosepsis: bacterial infection of blood in urinary tract

#### E Clinical findings

1. Younger than 2 years of age: mimic GI disorders, failure to thrive, feeding problems, vomiting, diarrhea
2. Older than 2 years of age: dysuria, urgency, frequency, daytime incontinence, enuresis

#### F Therapeutic interventions

1. Antibiotics to eliminate infection
2. Identification and correction of structural anomalies if present
3. Prevention of recurrence; preservation of renal function

## ***Nursing Care of Children with Urinary Tract Infections***

### **Assessment/Analysis**

1. Discomfort on urination (dysuria)
2. Pattern of urinary elimination
3. Pattern of bowel elimination
4. Amount of fluid intake
5. Result of urinalysis/urine culture and sensitivity

### **Planning/Implementation**

1. Develop voiding schedule to limit urinary stasis; encourage to completely empty bladder when voiding
2. Increase fluids to enhance urine production/voiding
3. Encourage girls to wear loose cotton underpants; avoid tight, outer pants
4. Encourage routine health care supervision
5. Encourage increase in dietary fiber to minimize constipation, which contributes to UTI

### **Evaluation/Outcomes**

1. Resolves infection
2. Implements measures to prevent recurrence

## **Asthma**

### ***Data Base***

A Chronic inflammatory disorder of airways

1. Reversible airflow limitation
2. Spasms of bronchi and bronchioles
3. Edema of mucous membranes
4. Increased secretions

5. Respiratory acidosis from accumulation of carbon dioxide

B Incidence: increasing rate of occurrence, severity, and mortality; most common chronic disease of childhood

C Risk factors

1. Immunologic exposure to antigen that is deposited on respiratory mucosa
2. Nonimmunologic stimuli (e.g., viral infections, physical and chemical substances)

D Primary cause of school absences; leading cause of pediatric hospitalizations

E Classification

1. Mild intermittent: symptoms two or fewer times each week; brief exacerbations; nighttime symptoms two or fewer times each month
2. Mild persistent: symptoms more than two times per week but less than once a day; exacerbations affect activity; nighttime symptoms more than twice per month
3. Moderate persistent: daily symptoms; frequent nighttime symptoms; limited physical activity
4. Severe persistent: continual symptoms; frequent exacerbations; frequent nighttime symptoms; limited physical activity

F Status asthmaticus: continued respiratory distress despite usual interventions; considered medical emergency

G Clinical findings

1. Wheezing, especially on expiration
2. Labored breathing, flaring nares
3. Cough, increased secretions
4. Tachycardia
5. Restlessness, apprehension
6. Upright sitting position with shoulders forward
7. Diminished peak expiratory flow (PEF)

H Therapeutic interventions

1. Long-term control medications (preventive medicines): achieve and maintain control of inflammation (e.g., inhaled corticosteroids, long-acting beta-adrenergics, methylxanthines, leukotriene modifiers, mast cell stabilizers)
2. Quick-relief medications (rescue medications): treat symptoms and exacerbations (e.g., short-acting beta-adrenergics, anticholinergics, systemic corticosteroids)
3. Medications for both quick relief and long-term control: beta-adrenergics, methylxanthines, anticholinergics
4. Commonly used medications
  - a. Corticosteroids
    - (1) Action: antiinflammatory effect diminishes inflammatory component of asthma and reduces airway obstruction; preferred controller medicine for all ages; safe for most children in recommended dosage
    - (2) Inhaled: few side effects
  - b. Leukotriene modifiers: zafirlukast (Accolate), montelukast (Singulair)
    - (1) Action: prevents release of mediators of type I allergic reactions (e.g., histamine); lessens bronchoconstriction

(2) Adverse effects: nausea, vomiting, headache, dizziness, infection, angioedema

c. Beta-adrenergic agonists: albuterol (Proventil), levalbuterol (Xopenex), terbutaline

(1) Action: act on beta-adrenergic receptors in bronchi to relax smooth muscle and increase respiratory volume; used for quick relief in rescue situations

(2) Adverse effects: tachycardia, hyperactivity, insomnia, tremors; overuse of inhalants may cause “congestive rebound”

## ***Nursing Care of Children with Asthma***

### **Assessment/Analysis**

1. Respiratory status
2. History of current and previous attacks
3. Precipitating events/environmental factors
4. Knowledge of drug therapy

### **Planning/Implementation**

1. Administer parenteral drugs per protocol
2. Improve ventilating capacity
  - a. Position in a high-Fowler or orthopneic position
  - b. Teach breathing exercises and controlled breathing
  - c. Observe return demonstration on using peak expiratory flow meter (PEFM) to monitor airflow
3. Teach parents
  - a. How to give control and rescue medications; explain why control medications are necessary even if child is asymptomatic
  - b. To encourage rinsing mouth after inhalation to reduce risk for oral candidiasis (thrush)
  - c. How to minimize exposure to environmental triggers in home (e.g., dust, dust mites, mold, secondhand cigarette smoke, animal dander)
  - d. That controlled environment can limit attacks
    - (1) Allergy-proof home (e.g., damp dust, no carpets, vacuum daily)
    - (2) Manage exertion, limit exposure to cold air, avoid people with infections

### **Evaluation/Outcomes**

1. Continues medication protocol
2. Breathes without dyspnea when at rest or engaging in activities
3. Manages respiratory secretions
4. Obtains sufficient sleep
5. Maintains family and peer-group relationships
6. Child and family members cope with impact of chronic illness

# Mucocutaneous Lymph Node Syndrome (Kawasaki Disease)

## **Data Base**

A Acute febrile illness principally involving cardiovascular system

1. Extensive perivasculitis of arterioles, venules, capillaries, coronary arteries
2. Panvasculitis and perivasculitis of main coronary arteries may cause stenosis or obstruction with aneurysm formation
3. Pericarditis, interstitial myocarditis, and endocarditis; phlebitis of larger veins
4. Cause unknown

B Geographic and seasonal outbreaks

C Clinical findings

1. Fever for 5 or more days, cervical lymphadenopathy
2. Bilateral congestion of ocular conjunctiva without exudate
3. Changes in mucous membranes of oral cavity (e.g., erythema, dryness, fissuring of lips, oropharyngeal reddening, "strawberry tongue")
4. Changes in extremities (e.g., peripheral edema, peripheral erythema, desquamation of palms and soles; polymorphous rash, primarily of trunk)
5. Extreme irritability
6. Joint stiffness and pain

D Therapeutic interventions

1. Primarily supportive: directed toward preventing dehydration, minimizing possible cardiac complications
2. Cardiac monitoring
3. Intravenous gamma globulin
4. Large doses of aspirin initially, then low-dose therapy

## **Nursing Care of Children with Kawasaki Disease**

### **Assessment/Analysis**

1. Cardiac status, signs of heart failure
2. Fluid balance
3. Clinical findings associated with syndrome

### **Planning/Implementation**

1. Administer aspirin; assess for early signs of toxicity
2. Monitor for signs of cardiac complications, especially dysrhythmias
3. Observe for allergic reaction to and side effects of IV gamma globulin
4. Use pain rating scale and medicate appropriately
5. Minimize skin discomfort (e.g., cool baths; nonscented lotions; soft, loose clothing)
6. Maintain quiet environment to reduce irritability
7. Provide emotional support to child and parents; child is often inconsolable

## Evaluation/Outcomes

1. Regains skin integrity
2. Remains free from complications (e.g., cardiac problems, aspirin toxicity)
3. Remains comfortable
4. Child and parents discuss feelings

## Tonsillectomy and Adenoidectomy

### ***Data Base***

A Performed only when indicated: lymphoid tissue helps prevent invasion of organisms

B Indications for surgical removal

1. Recurrent tonsillitis or otitis media
2. Enlargement that interferes with breathing or swallowing

C Contraindications for removal

1. Occasional infections that resolve rapidly
2. Cleft palate, hemophilia, or debilitating illness (e.g., leukemia)

D Clinical findings: postoperative

1. Postsurgical hemorrhage: first 24 hours caused by trauma to vascular site; 5 to 10 days after surgery caused by sloughing of tissue
2. Signs of hemorrhage: frequent swallowing; bright red blood in vomitus; restlessness; increased pulse rate; pallor

### ***Nursing Care of Children Having a Tonsillectomy and/or Adenoidectomy***

### Assessment/Analysis

1. Presence of bleeding, frequent swallowing
2. Presence and extent of pain
3. Swallowing ability

### Planning/Implementation

1. Keep positioned on side to promote drainage of secretions; elevate head of bed to limit edema
2. Offer cool liquids that are not red in color or thick; gelatin (Jell-O) allowed if not red
3. Ask child to talk, provide assurance that it is possible
4. Apply ice collar for pain relief
5. Use pain rating scale and administer prescribed medication
6. During initial postoperative days: offer soft foods; avoid crisp foods (e.g., bacon, pretzels, chips) that could interrupt suture line

### Evaluation/Outcomes

1. Maintains patent airway
2. Manages respiratory secretions

3. Reports minimal pain
4. Maintains fluid and nutritional status

## Emotional Disorders

For common emotional disorders of the preschooler, see [Chapter 17, Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence](#)

# Nursing Care of School-Age Children

---

# Growth and Development

## Developmental Timetable

### A Physical growth

1. Lanky appearance up to 10 to 12 years: bone development precedes muscular development
  - a. At 6 years: grows 2 inches; gains 2 to 3 kg ( $4\frac{1}{2}$  to  $6\frac{1}{2}$  lb) per year
  - b. At 7 years: grows 2 inches; gains 2.5 kg ( $5\frac{1}{2}$  lb) per year
  - c. At 8 to 9 years: grows 2 inches; gains 3 kg ( $6\frac{1}{2}$  lb) per year
  - d. From 10 to 12 years
    - (1) Slow growth in height compared to rapid weight gain; grows  $2\frac{1}{2}$  inches; gains 4.5 kg (10 lb) per year
    - (2) Pubescent changes begin to appear; earlier in females than in males
2. Permanent dentition completed: begins with 6-year molars and central incisors at 7 or 8 years of age

### B Motor

1. Refinement of coordination, balance, and control
2. Motor development is primary; necessary for competitive activity

### C Sensory: visual acuity should be 20/20

### D Mental abilities

1. Readiness for learning, especially in perceptual organization
  - a. Names months of year
  - b. Knows right from left
  - c. Tells time
  - d. Follows several instructions at once
2. Understands rules and reasons for them
3. Solves trial-and-error problem conceptually rather than through action
4. Greater understanding and use of language
5. Concrete operations (Piaget): knows that quantity remains same when appearance differs (conservation)
6. Begins to appreciate economics and finances

# Health Promotion of School-Age Children

## Play

A Varies with age: number of play activities decreases; amount of time spent in one activity increases

B Prefers games with

1. Rules because of increased mental abilities
2. Athletic competition because of increased motor ability

C Early school years: boys and girls play together, gradually separate into sex-oriented activities based on cultural influences

D Suggested play for 6- to 9-year-olds

1. Housekeeping toys that work; doll accessories; paper-doll sets; simple sewing machine; needlework; building toys
2. Simple word, number, and card games
3. Physically active games (e.g., hopscotch, jump rope, tree climbing, bicycle riding)
4. Collections and hobbies (e.g., stamp collecting, building simple models)
5. Computer games

E Suggested play for 9- to 12-year-olds

1. Handicrafts (e.g., model kits, pottery clay, hobbies, collections)
2. Skilled and intellectual play (e.g., computer games, chess, puzzles, science sets, magic sets)

F Physically active games; team sports

# Hospitalization of School-Age Children

## Database

### A Typical reactions

1. Usually tolerates separation but prefers parents to be near
2. Fears the unknown, especially when dependency or loss of control is expected
3. Fears bodily harm, especially disfigurement
4. Concept of death changes:
  - a. 6 to 8 years: personifies death as a “bogeyman”
  - b. 9 to 10 years: has realistic concept, may add to other fears
5. Concerned about self-image when reacting to pain; may use avoidance to cope with physical discomfort
6. Wants scientific rationale for treatments and procedures; willing to participate in self-care

B Preparation: age appropriate explanations are associated with increased cognitive and verbal abilities

## General Nursing Care of School-Age Children

### A Begin preparing for hospitalization before admission, if possible

1. Provide explanations that are simple, honest, and at level of understanding
2. Add details about procedures, drugs, surgery, and related issues based on cognitive level and personal experiences

### B Involve child and parents in planning care

### C Play activities

1. Use as outlet for fear, anger, hostility, and as temporary escape from reality
2. Provide diversional play activities that support/challenge mental and motor skills as indicated

### D Encourage to express feelings, emotions, and fears

### E Expect and accept regression

### F Check for loose teeth, especially before surgery

### G Provide for tutoring if absence from school is more than 2 weeks

### H Encourage

1. Visits from siblings and peers
2. Formation of new peer relationships to promote socialization

### I Assign age-appropriate roommates who do not compromise physical status

### J Allow dependency, but foster independence as much as possible; be consistent when enforcing rules

# Health Problems Most Common in School-Age Children

## Obesity

### **Data Base**

A Body Mass Index (BMI): measure of weight in relation to height; plotted on National Center for Health Statistics growth charts

1. Obesity: BMI at or above 95th percentile for children of same age and gender
2. Overweight: BMI at or above 85th to 95th percentile

B Incidence

1. Preschoolers: 10.4%
2. School-age: 19.6%
3. Adolescents: 18.1%

C Risk factors

1. Multifactorial (e.g., metabolic, hypothalamic, genetic, social, cultural, psychological)
2. Illness related (e.g., hypothyroidism, adrenal hypercorticism, hyperinsulinism); less than 5%
3. Central nervous system (CNS) damage (e.g., injury, infection, brain attack)
4. Complication of illness because of immobility (e.g., muscular dystrophy, paraplegia, Down syndrome, spina bifida)

D Therapeutic interventions

1. Prevention
  - a. Early recognition and control measures
  - b. Education about consequences of obesity
  - c. Education about nutritious diet
2. Regulation of body weight by promoting balance between energy intake and energy expenditure
  - a. Regulation of appetite
  - b. Dietary modification, institution of nutritious diet
  - c. Control of environment related to availability of high-calorie foods
  - d. Promotion of physical activity

### **Nursing Care of the Obese Child**

### **Assessment/Analysis**

1. History: family, health, dietary choices/patterns
2. Socioeconomic status
3. Cultural and environmental influences
4. Weight, height
5. Eating habits

## 6. Physical activity

### Planning/Implementation

#### 1. Prevention

- a. During infancy: promote and support breastfeeding for 6 months; encourage mother to continue breastfeeding after introduction of solid food until 12 months of age
- b. Encourage parents to
  - (1) Provide nutritious meals
  - (2) Limit sedentary activity (e.g., television, computer)
  - (3) Promote physical activity

#### 2. Weight management

- a. Help to modify diet (e.g., five servings of fruits and vegetables each day; calcium-rich, high-fiber foods; low-calorie dairy products)
- b. Teach to limit consumption of sugar-sweetened beverages, high-calorie snacks
- c. Encourage to eat family meals together
- d. Encourage at least 1 hour of physical activity/day, participation in team sports
- e. Limit time spent in sedentary activities

#### 3. Structured weight management for BMI between 95th and 98th percentiles

- a. Initiate combination of written diet and exercise plans
- b. Encourage follow-up care

#### 4. Refer for comprehensive multidisciplinary intervention; requires frequent visits to health care provider, dietician, exercise and behavioral specialists

### Evaluation/Outcomes

1. Stops gaining weight
2. Loses weight
3. Family incorporates therapeutic intervention into daily life

## Diabetes Mellitus

### Data Base

(See [Chapter 9](#), Nursing Care of Clients with Endocrine System Disorders, Diabetes Mellitus)

#### A Incidence

1. 11 to 20 per 100,000
2. Peaks at 10 to 15 years of age; can occur at any age

#### B Risk factors

##### 1. Genetic

- a. Based on ethnic origin (e.g., type 1 more frequent among Caucasians, less frequent among African-Americans)
- b. Gene mutation (maturity-onset diabetes of the young)

c. Inheritance: 100% concordance in identical twins

2. Immunologic

3. Environmental (e.g., obesity for type 2)

C Classification (see [Table 33-1](#): Characteristics of Type 1 and Type 2 Diabetes Mellitus)

**Table 33-1**

**Characteristics of Type 1 and Type 2 Diabetes Mellitus**

Characteristic	Type 1	Type 2
Age at onset	<20 years	Increasingly occurring in younger children
Type of onset	Abrupt	Gradual
Sex ratio	Affects males slightly more than females	Females outnumber males
Percentage of diabetic population	5% to 8%	85% to 90%
Heredity:		
Family history	Sometimes	Frequently
Human leukocyte antigen	Associations	No association
Twin concordance	25% to 50%	90% to 100%
Ethnic distribution	Primarily Caucasians	Increased incidence in Native Americans, Hispanics, African-Americans
Presenting symptoms	3 P's common: polyuria, polydipsia, polyphagia	May be related to long-term complications
Nutritional status	Underweight	Overweight
Insulin (natural):		
Pancreatic content	Usually none	>50% normal
Serum insulin	Low to absent	High or low
Primary resistance	Minimum	Marked
Islet cell antibodies	80% to 85%	<5%
Therapy:		
Insulin	Always	20% to 30%
Oral agents	Ineffective	Often effective
Diet only	Ineffective	Often effective
Chronic complications	>80%	Variable
Ketoacidosis	Common	Infrequent

From Hockenberry M, Wilson D: *Wong's essentials of pediatric nursing*, ed 8, St. Louis, 2009, Mosby.

1. Type 1: lack of insulin production

2. Type 2: resistance to insulin action; defective glucose-mediated insulin secretion

3. Other types: pancreatic defects (e.g., cystic fibrosis-related)

D Differences between children and obese children/adults

1. Children

a. Usually type 1; rapid onset

b. Prone to hypoglycemia and ketoacidosis

c. Medication: insulin

d. Degenerative vascular changes develop after adolescence

2. Obese children/adults

a. Usually type 2; insidious onset

b. Hypoglycemia and ketoacidosis less common

c. Dietary treatment: can be effective with weight loss, exercise

d. Medications: oral hypoglycemics

- e. Degenerative vascular changes: child—usually develop after adolescence; adult—usually present at time of diagnosis

#### E Clinical findings: type 1

1. Onset: rapid, obvious
2. Usually thin, underweight
3. Three Ps: **P**olydipsia; **P**olyphagia; **P**olyuria
4. Hyperglycemia, ketoacidosis, diabetic coma

##### a. Causes

- (1) Inadequate exogenous insulin
- (2) Emotional stress
- (3) Physical stress (e.g., fever, infection)
- (4) Increased food intake

##### b. Characteristics (see [Table 33-2: Comparison of Hypoglycemia and Hyperglycemia](#))

---

**Table 33-2**

**Comparison of Hypoglycemia and Hyperglycemia**

---

Variable	Hypoglycemia	Hyperglycemia
Onset	Rapid (minutes)	Gradual (days)
Mood	Labile, irritable, nervous, weepy	Lethargic
Mental status	Difficulty concentrating, speaking, focusing, coordinating	Dulled sensorium
Inward feeling	Nightmares Shaky feeling Hunger Headache Dizziness	Confusion Thirst Weakness Nausea and vomiting Abdominal pain
Skin	Pallor Sweating	Flushed Signs of dehydration
Mucous membranes	Normal	Dry, crusty
Respirations	Shallow, normal	Deep, rapid (Kussmaul)
Pulse	Tachycardia, palpitations	Less rapid, weak
Breath odor	Normal	Fruity, acetone
Neurologic	Tremors	Diminished reflexes Paresthesia
Ominous signs	Late—Hyperreflexia, dilated pupils, seizure Shock, coma	Acidosis, coma
Blood:		
Glucose	Low: <60 mg/dl	High: $\geq 250$ mg/dl
Ketones	Negative	High, large
Osmolarity	Normal	High
pH	Normal	Low ( $\leq 7.25$ )
Hematocrit	Normal	High
Bicarbonate	Normal	<20 mEq/L
Urine:		
Output	Normal	Polyuria (early) to oliguria (late) Enuresis, nocturia
Glucose	Negative	High
Ketones	Negative or trace	High
Visual	Diplopia	Blurred vision

## 5. Hypoglycemia related to insulin therapy

### a. Causes

- (1) Insulin overdose
- (2) Decreased food intake
- (3) Increased physical exercise (activity moves glucose into muscle cells)

### b. Characteristics (see [Table 33-2: Comparison of Hypoglycemia and Hyperglycemia](#))

## F Therapeutic interventions

1. Dietary: calories, carbohydrate, fat, protein intake balanced with physical activity and metabolic needs
2. Insulin (see [Chapter 9](#), Nursing Care of Clients with Endocrine System Disorders, Related Pharmacology, Antidiabetic Agents)
3. Exercise: increased physical activity to reduce need for insulin
4. Hyperglycemia: hospitalization with administration of fluids, electrolytes, insulin
5. Hypoglycemia: immediate supply of readily available glucose followed by complex carbohydrate and protein

## ***Nursing Care of Children with Diabetes Mellitus***

### **Assessment/Analysis**

1. Knowledge and attitudes about disease and its management
2. Blood glucose levels: expected values for child, 50 to 85 mg/dL; for adolescent, 60 to 110 mg/dL
3. Glycosylated hemoglobin (hemoglobin A<sub>1c</sub>)
  - a. Younger than 6 years: 7.5% to 8.5% acceptable range.
  - b. From 6 to 12 years: under 8% acceptable
  - c. From 13 to 19 years: under 7.5% acceptable
4. Insulin types, dosages, responses (e.g., onset of action; peak action)
5. Signs of hypoglycemia/hyperglycemia
6. Complications

### **Planning/Implementation**

1. Discuss disorder based on parents' and child's knowledge
2. Teach factors that affect insulin requirements (e.g., physical growth, activity, food intake, presence of infection)
3. Teach signs and symptoms of hyperglycemia and hypoglycemia; provide written list for reinforcement
4. Teach appropriate interventions for complications
  - a. Suspected insulin reaction: give glucose source and skim milk
  - b. Suspected ketoacidosis: notify health care provider; do not increase insulin dose
5. Explain prescription for insulin is adjusted as indicated
6. Teach about prevention of infection (e.g., skin care; correctly fitted shoes; prompt

treatment of small cuts; protection from exposure to communicable illness)

7. Encourage well-balanced diet
  - a. Equal quantities of food to be eaten at regular intervals if possible, rather than three large meals
  - b. Regularly scheduled snacks, particularly before bedtime if taking intermediate-acting insulin
  - c. Usually unrestricted within reason
8. Help plan exercise and adjust food intake and insulin dosage to meet requirements; food intake should increase before exercising
9. Teach self-care skills when motor and mental abilities allow, usually by 7 to 9 years of age
  - a. Give simple explanations
  - b. How to perform blood glucose testing
  - c. How to administer insulin (by injection or pump); use diagrams for location of administration sites
10. Encourage periodic adult observation of self-care techniques
11. Provide emotional support; offer choices when possible for sense of control
12. Encourage continued health care supervision

## Evaluation/Outcomes

1. Maintains blood glucose levels within identified range
2. Consumes adequate calories for growth and development
3. Remains free from complications (e.g., insulin coma; ketoacidosis)
4. Demonstrates behaviors reflective of a positive self-image
5. Child and parents demonstrate ability to follow health care regimen

## Hemophilia

### **Data Base**

A Defect in clotting mechanism of blood

B Risk factor: Genetic; X-linked recessive transmission in males; females are carriers

C Classification

1. Factor VIII deficiency (hemophilia A, classic hemophilia); 80% to 85%
2. Factor IX deficiency (hemophilia B, Christmas disease)

D Clinical findings

1. Varied expression of gene in relation to degree and severity of bleeding
2. May be diagnosed early
  - a. Newborn: bleeding after vitamin K administration, after circumcision
  - b. Infant: with increased activity
3. Severity of bleeding depends on factor VIII activity
  - a. Mild: bleeding with severe trauma or surgery; factor VIII activity 5% to 40%
  - b. Moderate: bleeding with trauma; factor VIII activity 2% to 4.9%

- c. Severe: spontaneous bleeding without trauma; factor VIII activity less than 2%
- 4. Bleeding into joints (hemarthrosis) resulting in pain, deformity, impaired growth
- 5. Intracranial hemorrhage
- E Therapeutic interventions
- 1. Prevention of bleeding with factor replacement (primary prophylaxis)
  - a. Factor VIII concentrate from pooled plasma or recombinant DNA
  - b. Factor IX concentrate from recombinant DNA; complex contains factors II, VII, IX, X
  - c. DDAVP (1-deamino-8-D-arginine vasopressin) for mild hemophilia; vigorous treatment to prevent joint bleeding if positive response
- 2. Regular program of exercise and physical therapy to strengthen muscles around joints and minimize bleeding
- 3. Control of bleeding with factor VIII concentrate when it occurs (secondary prophylaxis)
  - a. Regular infusion schedule (three times per week)
  - b. High-dose infusion when bleeding occurs
    - (1) Two days of standard dose
    - (2) Continued infusions every other day for 1 week
- 4. Medications
  - a. Pain: nonsteroidal antiinflammatory drugs (NSAIDs): ibuprofen (Motrin, Advil) for synovitis; used cautiously because of potential effect on platelet function
  - b. Inflammation: corticosteroids for hematuria, acute hemarthrosis, chronic synovitis
  - c. Prevention of clot destruction: aminocaproic acid (Amicar), oral administration or local application

## ***Nursing Care of Children with Hemophilia***

### **Assessment/Analysis**

- 1. Parent/child knowledge of disease process
- 2. Knowledge of injury prevention and protective attire
- 3. Location and extent of bleeding
- 4. Mobility of joints
- 5. Medication schedule

### **Planning/Implementation**

- 1. Teach child and parents about treatment for bleeding, especially when it occurs in joints
  - a. Rest
  - b. Application of cool/ice compresses
  - c. Compression of area
  - d. Elevation of affected body part

2. Suggest appropriate activity that lessens chance of trauma, difficult because boys are physically active
3. Teach parents
  - a. How to safe-proof house to minimize injuries (e.g., secure throw rugs)
  - b. Which toys are safe or unsafe
  - c. Medication protocol
    - (1) Administer prescribed blood products in morning for optimum therapeutic effect
    - (2) Explain reasons for administering ibuprofen sparingly, why to avoid aspirin
  - d. To plan physical activity program that encourages use of extremities to prevent muscle atrophy
  - e. Importance of avoiding overprotection or over permissiveness; encourage consistency when disciplining
4. Provide emotional support to family
5. Refer parents for genetic counseling if planning more children

## Evaluation/Outcomes

1. Reports minimal pain
2. Remains free from injury (e.g., hemorrhage)
3. Maintains range of motion of joints
4. Participates in desired activities
5. Child and parents discuss feelings and concerns

## Rheumatic Fever (RF)

### **Data Base**

A Inflammatory disease affecting heart, joints, central nervous system, subcutaneous tissue

1. Follows infection with group A  $\beta$ -hemolytic streptococcus pharyngitis in 2 to 6 weeks if untreated

2. Complication: rheumatic heart disease with damage and scarring of mitral valve

B Risk factors: inadequate health care; limited access to antibiotics (most frequently in developing countries)

C Clinical findings

1. Heart: endocarditis, mitral and aortic valve stenosis

2. Joints: edema, inflammation, and effusion in knees, elbows, hips, shoulders, wrists

3. Skin: erythematous macules with clear center, wavy demarcated border on trunk and proximal extremities

4. Neurologic: chorea

5. Other manifestations: low-grade fever, epistaxis, abdominal pain, arthralgia, weakness, fatigue, pallor, anorexia, weight loss

## D Therapeutic interventions

1. Antibiotic therapy to eradicate organism and prevent recurrence; prophylactic therapy before dental work or invasive procedures (recommendations are changing)
2. Prevention of permanent cardiac damage
3. Palliation of other clinical manifestations
4. Salicylates to control inflammatory process
5. Prevention of recurrences

## ***Nursing Care of Children with Rheumatic Fever***

### **Assessment/Analysis**

1. Typical clinical manifestations
2. Activity level
3. Pain
4. Medication protocol

### **Planning/Implementation**

1. Encourage bed rest to reduce workload of heart during acute phase; gradually increase activities during recovery
2. Handle painful joints gently; maintain functional alignment to prevent deformities
3. Use pain rating scale and medicate appropriately
4. Offer small, frequent meals; encourage intake of nutritious foods and fluids
5. Emphasize abilities rather than limitations; promote development of quiet hobbies and collections
6. Provide emotional support
  - a. Keep communication channels open at home and with school
  - b. Refer for tutor as necessary
  - c. Encourage to do schoolwork

### **Evaluation/Outcomes**

1. Maintains cardiac output within acceptable limits
2. Consumes adequate calories for growth
3. Reports minimal pain
4. Maintains mobility of joints

## **Acute Poststreptococcal Glomerulonephritis (APSGN)**

### ***Data Base***

A Immune complex disorder occurring 10 to 21 days after infection with group A  $\beta$ -hemolytic streptococcus

B Incidence

1. Most common form of postinfectious glomerulonephritis

- 2. Peak age of onset during early school-age years (6 to 7)
- C Terminates with full recovery in 1 to 3 weeks; confers immunity; recurrence is rare
- D Clinical findings (during acute phase)
  - 1. Urine analysis: hematuria; proteinuria; elevated specific gravity
  - 2. Blood studies: azotemia from elevated BUN and creatinine
  - 3. Serology tests: confirmation of poststreptococcal infection (e.g., antistreptolysin O [ASO])
  - 4. Edema: periorbital in morning; spreads to rest of body during day
  - 5. General malaise: irritable; anorexic; lethargic
  - 6. Hypertension: mild to moderate
- E Therapeutic interventions
  - 1. Palliative treatment; supportive measures as needed
  - 2. Monitoring course of illness to prevent complications

## ***Nursing Care of Children with Acute Post Streptococcal Glomerulonephritis***

### **Assessment/Analysis**

- 1. Extent of edema
- 2. Extent of kidney involvement; results of urinalysis
- 3. Changes in vital signs
- 4. Blood and serologic findings
- 5. Behavior: irritability; lethargy
- 6. Headache; discomfort; signs of impending seizures

### **Planning/Implementation**

- 1. Maintain fluid balance (e.g., monitor daily weights, vital signs; I&O; restrict fluids as ordered)
- 2. Provide nutritious diet based on preferences
- 3. Implement moderate sodium restriction when edematous and/or hypertensive
- 4. Document and report signs of complications (e.g., severe hypertension; gross hematuria; gross edema; behavioral changes that may signify cerebral involvement)
- 5. Administer prescribed medications (e.g., diuretics, antihypertensives, antibiotics) based on response to illness
- 6. Instruct parents about supportive care if child is treated at home (e.g., balancing rest and activity; nutritious diet; dietary and fluid restrictions; prevention of infection; administration of medications)
- 7. Emphasize importance of follow-up care (e.g., weekly, then monthly) for health supervision, evaluation of progress, and resolution of illness

### **Evaluation/Outcomes**

- 1. Parents report that there is increased urine output as condition resolves

2. Recovers from illness within 3 weeks
3. Remains free from complications or recurrences
4. Continues health supervision until discharged by health care provider

## **Reye Syndrome**

### ***Data Base***

- A Acute toxic encephalopathy associated with characteristic organ involvement
- B Incidence: decreasing because of education to avoid administering aspirin and other salicylates
- C Risk factors
1. Viral illness (e.g., influenza, varicella)
  2. Aspirin administration for fever from influenza or varicella
- D Clinical findings
1. Fever
  2. Cerebral edema, profound impaired level of consciousness
  3. Liver involvement: disordered function; fatty changes
- E Therapeutic interventions
1. Early diagnosis with liver biopsy
  2. Aggressive therapy determined by clinical staging; prognosis based on staging

### ***Nursing Care of Children with Reye Syndrome***

#### **Assessment/Analysis**

1. Vital signs and neurologic status
2. Fluid balance for dehydration; cerebral edema
3. Level of consciousness
4. Impaired coagulation (related to hepatic dysfunction)

#### **Planning/Implementation**

1. Maintain patent airway
2. Monitor
  - a. Vital signs: especially pulse pressure
  - b. Fluid balance: I&O; report imbalance immediately
  - c. Neurologic status; report signs of increasing intracranial pressure
  - d. Liver dysfunction: laboratory test results
3. Provide emotional support to parents
  - a. Keep informed of child's progress
  - b. Include in child's care whenever possible
4. Foster dissemination of information concerning role of aspirin and products containing salicylates (e.g., Pepto-Bismol) in relation to viral disease and development of Reye syndrome

## Evaluation/Outcomes

1. Maintains patent airway, appropriate breathing pattern
2. Remains free from injury
3. Maintains fluid balance
4. Parents verbalize questions and concerns about child's status

## Juvenile Idiopathic Arthritis (JIA)

### **Data Base**

A Group of chronic autoimmune inflammatory diseases affecting joints and other tissues

B Incidence

1. 1 in 1000 children
2. Onset: younger than 16 years; peak ages 1 to 3 years
3. Female predominance: 2:1

C Classification

1. Systemic: one or more joints associated with 2 weeks of clinical manifestations
2. Oligoarthritis: one to four joints for first 6 months; may last for more than 6 months
3. Polyarthritis
  - a. Negative rheumatoid factor: five or more joints for 6 months
  - b. Positive rheumatoid factor: five or more joints for 6 months
4. Psoriatic arthritis: associated with skin lesions
5. Inflammation of tendon insertion site (enthesitis): associated with back pain and other clinical manifestations

D Clinical findings

1. Stiffness, swelling, loss of motion in affected joints; most common in morning and after inactivity
2. Joint enlargement from edema, joint effusion, and synovial thickening
3. Fever, rash, lymphadenopathy, hepatomegaly (systemic arthritis)

E Therapeutic interventions

1. Medications
  - a. First-line drugs—nonsteroidal antiinflammatory drugs (NSAIDs): ibuprofen (Advil, Motrin), naproxen sodium (Aleve), tolmetin sodium (Mylan)
  - b. Second-line drug—antineoplastic/antimetabolite: methotrexate (Trexall)
  - c. Corticosteroids: immunosuppressants used for life-threatening complications
  - d. Tumor necrosis factor inhibitor: etanercept (Enbrel)
  - e. Slow-acting antirheumatic drugs (SAARDs): sulfasalazine (Azulfidine), hydroxychloroquine (Plaquenil)
2. Physical and occupational therapy: individualized to preserve function and prevent deformity

### **Nursing Care of Children with Juvenile Idiopathic Arthritis**

## Assessment/Analysis

1. Status of involved joints
2. Physical restrictions
3. Location and extent of pain
4. Response to illness

## Planning/Implementation

1. Emphasize importance of medication protocol
  - a. Take medications regularly, even during remissions
  - b. Give NSAIDs with food to prevent GI irritation
2. Promote functional alignment
  - a. Perform passive range of motion exercises
  - b. Use exercise program designed by physical therapist to limit impact on joints
  - c. Discourage prolonged sitting
3. Encourage warm baths or application of moist heat compresses to joints early in day to decrease stiffness and increase mobility
4. Offer nutritious diet that does not exceed energy needs
5. Promote adequate rest and sleep
6. Provide emotional support
  - a. Encourage parents to accept their child's illness; to avoid using it as a means of fostering dependency or controlling relationship
  - b. Promote social interaction with peers
  - c. Encourage verbalization of feelings; emphasize abilities rather than limitations

## Evaluation/Outcomes

1. Reports minimal pain
2. Maintains mobility of joints
3. Participates in activities with minimal discomfort and sufficient energy
4. Participates in self-care to fullest extent of abilities
5. Child and family maintain health care regimen

## Legg-Calvé-Perthes Disease (Coxa Plana)

### **Data Base**

A Disturbance of circulation to femoral capital epiphysis that produces ischemic aseptic necrosis of femoral head, epiphysis, and acetabulum

1. Cause unknown
2. Both hips involved in 10% to 15%
3. Skeletal age below chronologic age

### B Incidence

1. Occurs between 2 and 12 years of age
2. Most common in males 4 to 8 years of age; male to female ratio 4:1

3. More common in Caucasians than in African-Americans (10:1)

#### C Stages

1. I: initial or avascular
2. II: fragmentation or revascularization
3. III: reossification or reparative
4. IV: residual or regenerative

#### D Clinical findings

1. Insidious onset
2. Pain in hip, thigh, and/or knee of affected limb; more evident in morning and after activity
3. Limitation of movement in affected hip(s); limp

#### E Therapeutic interventions

1. Controversy over conservative versus surgical intervention
2. Maintenance of head of femur in acetabulum (e.g., abduction brace, surgery)
3. Non-weight-bearing (e.g., wheelchair, surgical placement of fixator device)
4. Intensive physical therapy
5. Surgery to reduce pain, contain femur in acetabulum, and conserve acetabulum for future hip replacement

## ***Nursing Care of Children with Legg-Calvé-Perthes Disease***

### **Assessment/Analysis**

1. Extent of pain
2. Extent of joint dysfunction
3. Ambulation gait

### **Planning/Implementation**

1. Educate child and parents regarding
  - a. Correct use of appliances, skin care at brace edges
  - b. Non-weight-bearing (e.g., no standing or kneeling on affected leg)
  - c. Need for physical therapy
2. Assist child and family in selecting activities according to age, interests, and physical limitations (e.g., quiet games, hobbies, collections, model building, crafts)
3. Encourage peer interaction; help child determine alternatives to weight-bearing activity (e.g., scorekeeping, acting as sideline “coach”)
4. Help child devise explanations for appliances

### **Evaluation/Outcomes**

1. Reports minimal pain
2. Remains free from injury
3. Achieves full range of motion
4. Participates in activities with immobilizing device

5. Continues health care regimen and supervision
6. Discusses feelings and concerns

# Skin Infections and Infestations

## General Nursing Care of Children with Skin Infections and Infestations

### **Assessment/Analysis**

1. Type of skin lesion
2. Location and extent of discomfort or itching
3. Knowledge of cause, prevention, and treatment
4. Self-concept and social isolation related to change in appearance

### **Planning/Implementation**

1. Encourage daily bathing with tepid water; dry thoroughly; expose area to light and air
2. Prevent secondary infection (e.g., keep nails short, administer medications to limit pruritus, avoid strong alkalis or bleach when washing clothes); secondary lesions may leave scars
3. Encourage completion of full regimen of antimicrobial medication; follow instructions on package insert particularly for topical medications (e.g., length of time left on, repeat applications)
4. Prevent spread of infection to others
  - a. Discourage sharing of personal articles (e.g., combs, brushes, hats)
  - b. Discourage direct contact between children.
  - c. Keep oozing lesions covered
  - d. Encourage practices to prevent athlete's foot
    - (1) Do not walk barefoot
    - (2) Dry feet thoroughly
    - (3) Wear lightweight shoes to decrease heat
    - (4) Disinfect shoes and socks
    - (5) Avoid sharing towels
5. Encourage screening in schools to identify source of infection

### **Evaluation/Outcomes**

1. Confines skin lesions to primary site and infection/infestation to self
2. Remains free from secondary infection
3. Remains free from discomfort
4. Child and parents verbalize how to prevent future infection/infestation

## Pediculosis Capitis (Head Lice)

### **Data Base**

A Infestation of scalp with *Pediculus humanus capitis*

1. Transferred from one person to another via personal items
2. Unrelated to age, gender, socioeconomic status, cleanliness
3. Severe itching resulting in scratching, may lead to secondary infection

#### B Clinical findings

1. Nits (grayish white, oval eggs) attached to hair shaft close to skin, particularly hair behind ears, nape of neck, occipital area
2. Pruritus

#### C Therapeutic interventions

1. Treatment with pediculicide; permethrin 1% cream, (Nix); pyrethrin-piperonyl butoxide (Rid)
2. Fine-toothed comb to remove nits
3. All bed linens and clothes washed in hot water and detergent
4. Return to school as soon as possible as per policy

## Scabies

### **Data Base**

#### A Produced by itch mite *Sarcoptes scabiei*

1. Female burrows into stratum corneum of epidermis to lay eggs
2. Severe itching resulting in scratching, may lead to secondary infection

#### B Clinical findings

1. Pruritus
2. Eczematous eruption; minute grayish-brown threadlike burrows with black dot at end (mite)
3. Distribution of lesions primarily in folds (axillary, antecubital, popliteal, inguinal), hands/wrists, feet/ankles
4. Secondary infection: papules and vesicles

#### C Therapeutic interventions

1. Medications
  - a. Permethrin 5% cream (Elimite): remains on skin for 8 to 14 hours before bathing; second application 7 to 10 days later if needed
  - b. Crotamiton cream (Eurax): applied once each day for 2 days followed by bath
  - c. Ivermectin tablets (Stromectol): if reaction to skin application occurs, for severe lesions
  - d. Antibiotics for secondary infection
2. Emollients to relieve discomfort if rash/pruritus persists for 2 to 3 weeks
3. Clothes, bedding, towels used by infested person for 3 days before treatment washed with hot water
4. All family members treated to prevent transmission

## Ringworm

### **Data Base**

A Filamentous fungi: invade stratum corneum of skin, hair, and nails; transmission from person to person, or infected animal to person

B Type of organism and clinical findings

1. Tinea capitis: scalp lesions
  - a. Reddened, scaly oval or round areas of alopecia
  - b. Pruritus
2. Tinea pedis: athlete's foot,
  - a. Common in summer; contracted in swimming areas, gymnasium locker rooms
  - b. Scaly fissures between toes, vesicles on sides of feet
  - c. Pruritus
3. Other infestations
  - a. Tinea corporis (body lesions); tinea cruris ("jock itch")
  - b. Candidiasis: in chronically warm areas (e.g. thrush and diaper dermatitis in infants, vaginal form in older women)

C Therapeutic interventions

- a. Topical or oral: griseofulvin microcrystalline (Grifulvin V); nystatin (Mycostatin); ketoconazole (Nizoral); terbinafine [Lamisil]; oral administration has adverse effects (e.g., hepatotoxicity)
- b. Topical: clotrimazole (Desenex); econazole (Spectazole); miconazole (Lotrimin); selenium (Selsun); tolnaftate (Tinactin); undecylenic (Cruex)

## Intertrigo

### **Data Base**

A Excoriation of adjacent body surfaces; caused by moisture and chafing

B Clinical findings

1. Red, inflamed, moist, denuded areas
2. Most common sites: intergluteal folds, groin, neck, axilla

C Therapeutic interventions

1. Exposure to air and light
2. Keeping area clean and dry

## Impetigo

### **Data Base**

A Bacterial skin infection

1. Causative organisms: usually streptococci or staphylococci
  2. Severity depends on pathogenicity of organism, skin integrity, and host cellular defenses
  3. Highly contagious
- B Clinical findings
1. Begins as reddish macule
  2. Becomes vesicular, ruptures leaving superficial, moist lesion

3. Exudate dries, becomes honey-colored crust

4. Pruritus

C Therapeutic interventions: antibiotics systemically and locally; isolation

## Lyme Disease

(See [Chapter 13](#), Nursing Care of Clients with Infectious Diseases, Lyme Disease; and [Chapter 17](#), Nursing Care of Clients with Disorders First Evident in Infancy, Childhood, or Adolescence)

## Emotional Disorders

For common emotional disorders of the school-age child, see [Chapter 17: Nursing Care of Clients with Disorders Usually First Evident in Infancy, Childhood, or Adolescence](#) in Unit 3 (Mental Health/Psychiatric Nursing)

## CHAPTER 34

# Nursing Care of Adolescents

---

# Growth and Development

## Developmental Timetable

A Physical growth: physical changes associated with puberty

B Pubertal growth spurt

1. Female: 10 to 14 years
  - a. Weight: gains 7 to 25 kg (15 to 55 lb)
  - b. Height: approximately 95% of mature height achieved by onset of menarche or by skeletal age of 13 years; grows 5 to 25 cm (2 to 10 inches)
  - c. Secondary sex characteristics appear in order
    - (1) Breast buds, then breasts
    - (2) Hair: pubic, then axillary
    - (3) Pigmentation of genital skin
    - (4) Onset of menses (menarche): about 2 years after first signs
2. Male: 12 to 16 years
  - a. Weight: gains 7 to 30 kg (15 to 65 lb)
  - b. Height: approximately 95% of mature height achieved by skeletal age of 15 years; grows 10 to 30 cm (4 to 12 inches)
  - c. Secondary sex characteristics appear in order
    - (1) Testicular enlargement
    - (2) Hair: pubic, axillary, upper lip, face, body
    - (3) Voice: deepens
    - (4) Penis: lengthens and thickens
    - (5) Nocturnal emissions
  - d. Gynecomastia: 33% during mid-puberty; usually disappears within 2 years

C Mental abilities

1. Abstract thinking; increased understanding
  - a. Comprehends satire and double meanings
  - b. May say one thing and mean another
  - c. Conceptualizes thought; more interested in exploring ideas than facts
  - d. Appreciates scientific thinking; problem solves; explores theoretical alternatives
2. Perception
  - a. Appreciates nonrepresentational art
  - b. Understands that whole is more than sum of its parts
3. Learning
  - a. Long attention span
  - b. Learns through inference, intuition, and theorizing, rather than repetition and imitation
  - c. Enjoys experimenting with language by using jargon to suit changing moods

D Social patterns

1. Increased social communication
2. Develops peer-group identity

- a. Strong motivating force of behavior
- b. Important to be part of group and be similar to peers
- c. Clique formation: based on common culture (e.g., race, social class, ethnic group), common interests (e.g., hobbies, music, sports)

### 3. Interpersonal relationships

- a. Major goal: learning to form close intimate relationship with opposite sex or same sex, if homosexual
- b. May develop crushes, worship idols (e.g., rock or movie star)
- c. Engages in sexual exploration; questions sex role
- d. Present, rather than future, oriented

### 3. Independence needs

- a. Age 15 or 16 years: wants to be treated as adult
- b. Ambivalence: wants freedom but has difficulty accepting responsibility; may yearn for carefree days of childhood
- c. Parental ambivalence and discipline problems: try to allow for increasing independence but continue to offer guidance and enforce discipline

# Health Promotion during Adolescence

## Nutrition during Adolescence

### A Nutritional objectives

1. Provide optimum nutritional support for demands of rapid growth and high energy expenditure
2. Support development of appropriate eating habits through variety of foods, regular food pattern, quality snacks (e.g., high in protein; low in refined carbohydrate, primarily sugar)

### B Range of nutrient requirements increases; adequate intake of all nutrients should form basis of diet

### C Nutritional problems

1. Inadequate intake of calcium, vitamins A and C; iron in females
2. Anemia
3. Obese or underweight

### D Possible causes of nutritional deficiencies; need for effective counseling

1. Psychologic factors: food aversions; emotional problems
2. Fear of overweight: cultural pressure
  - a. Crash diets (mainly girls)
  - b. Fad diets: associated with misinformation
3. Choice of junk foods for snacks (e.g., high in sugar, fat, salt)
4. Irregular eating pattern
5. Pregnancy: requires higher intake of protein, calcium, and calories

### E Nutrition education: associated with concerns about physical appearance, figure control, complexion, physical fitness, athletic ability

## Injury Prevention during Adolescence

### A Education regarding

1. Sexual maturation, reproduction, sexual behavior
  - a. Sexually transmitted infections (STIs)
  - b. Contraception
  - c. Vaccination with human papillomavirus vaccine (HPV)
    - (1) Recommended for girls beginning at age 11 or 12
    - (2) Series of 3 injections given before first sexual contact
2. Driving in school or privately
3. Accidents: leading cause of death
  - a. Motor vehicle: most fatalities
  - b. Homicide and suicide: next two leading causes of death
4. Use and abuse of drugs and alcohol
5. Health hazards associated with smoking
6. Nutritional problems: anorexia nervosa, bulimia nervosa, obesity

7. Delinquency

B Health supervision

1. Acne

2. Orthopedic problems (e.g., scoliosis, kyphosis, lordosis)

3. Cancer screening

# **Hospitalization of Adolescents**

## **Data Base**

### **A Concerns**

1. Need for privacy, sense of control, independence
2. Apprehension about mutilation, disfigurement, loss of function
3. Body changes; body image
4. Separation from peers; possible loss of status in group

### **B Developmental problems magnified by illness**

## **General Nursing Care of Adolescents**

### **A Encourage parents and health team members to prepare for hospitalization**

1. Provide full explanations
2. Answer questions completely and honestly

### **B Involve in planning care**

### **C Develop trusting relationship (e.g., discuss feelings, procedures, care, prognosis)**

### **D Foster independence as much as possible**

### **E Provide for contact with peers**

### **F Arrange for continuity of schoolwork**

### **G Encourage adherence to health program**

### **H Encourage involvement with positive support systems**

### **I Encourage wearing clothing and applying makeup (girls) or shaving regularly (boys) to minimize perceived shortcomings**

# Health Problems Most Common in Adolescents

## Scoliosis

### Data Base

A Spinal curvature deformity causing cosmetic and physiologic alterations in spine, chest, and pelvis

1. Occurs in three planes
  - a. Lateral curvature of spine
  - b. Spinal rotation causing rib asymmetry
  - c. Thoracic hypokyphosis
2. Severity
  - a. Large curve worsens with time
  - b. Double curves (S-shaped curves) worsen more than do single curves (C-shaped curves)
  - c. Thoracic section of spine worsens more than upper or lower portion

B Incidence: most common spinal deformity; more frequent in girls during growth spurt

C Risk factors: unknown cause (idiopathic); possibly genetic

D Classification

1. Infantile: birth to 3 years of age
2. Juvenile: during childhood
3. Adolescent: most common during growth spurt

E Clinical findings (see [Figure 34-1: Curvatures of the spine](#))

**FIGURE 34-1** Curvatures of the spine. **A**, Normal spine. **B**, Mild scoliosis. **C**, Severe scoliosis. **D**, Asymmetry of shoulder, scapular, or flank shape, or hip height associated with scoliosis. (From Hockenberry M, Wilson D: *Wong's essentials of pediatric nursing*, ed 8, St. Louis, 2009.)

1. Curve in vertebral spinous process alignment
2. Prominence of one hip
3. Prominence of one scapula; difference in shoulder or scapular height
4. Deformity of rib cage; breasts appear unequal in size

5. Other signs: clothes do not fit; uneven skirt or pants hems

#### F Therapeutic interventions

1. Screening for scoliosis beginning at age 10; diagnosis confirmed by x-ray examination
2. Mild: orthopedic supervision every 4 to 6 months to monitor progression of curve
3. Moderate: bracing of bones still growing
  - a. Worn for 23 hours each day
  - b. Can be removed for sports and other physical activities
  - c. Effectiveness related to number of hours worn each day
  - d. Worn until bones have stopped growing; slows progression of curve
    - (1) Girls: about 2 years after onset of menstruation
    - (2) Boys: when shaving daily is necessary
  - e. Exercise to maintain and strengthen spinal and abdominal muscles
  - f. Types of braces ([Figure 34-2: Types of braces.](#))

**FIGURE 34-2** Types of braces. **A**, Thoracolumbosacral orthotic (TLSO). **B & C**, Variation of TLSO that fastens in the back. (From Hockenberry M, Wilson D: *Wong's essentials of pediatric nursing*, ed 8, St. Louis, 2009.)

4. Severe (more than 40°): surgery (e.g., spinal realignment and straightening with external or internal fixation; instrumentation combined with bony fusion [arthrodesis] of realigned spine [e.g., Harrington rods, Luque rod])
5. Most severe: traction devices and exercises before spinal fusion for partial correction to increase flexibility

## ***Nursing Care of Adolescents with Scoliosis***

### **Assessment/Analysis**

1. Symmetry of shoulders and hips while standing erect, clothed in underpants (and bra if older girl); observation from behind
2. Symmetry or prominence of ribs while bending forward with back parallel to floor; observation from side
3. Review of x-rays

## Planning/Implementation

1. Maintain spinal alignment per protocol
2. Provide care when wearing brace
  - a. Examine skin surfaces in contact with brace for signs of irritation
  - b. Implement corrective action to treat or prevent skin breakdown
  - c. Help select appropriate apparel for wearing over brace to minimize altered appearance
  - d. Encourage wearing low-heeled footwear to maintain balance
3. Reinforce instructions regarding
  - a. Plan of care
  - b. Use of appliance
  - c. Activities permitted or restricted (e.g., encourage activities that do not require twisting of spinal column)
  - d. Adolescent's and parents' responsibilities associated with therapy
4. Prepare for surgery if required

## Evaluation/Outcomes

1. Demonstrates correct use of brace
2. Reports minimal pain
3. Maintains skin integrity
4. Verbalizes feelings and concerns
5. Engages in activities appropriate to limitations and developmental level

## Bone Tumors

### Data Base

A Neoplastic disease that can arise from tissue involved in bone growth

B Incidence: less than 5% of all malignant neoplasms; peak ages 15 to 19 years

C Classification

1. Osteosarcoma
  - a. Most frequent bone tumor in children
  - b. Primary tumor sites: upper part of tibia; lower part of femur; humerus just below shoulder
  - c. Arises from osteoid tissue
2. Ewing sarcoma
  - a. Most frequent sites: shaft of long bones (e.g., femur, tibia, fibula, humerus, ulna); trunk bones (e.g., vertebra, scapula, ribs, pelvis, skull)

- b. Arises from medullary tissue (marrow)

D Prognosis depends on

1. Extent of metastasis
2. Size and location of tumor
3. Tumor's response to therapy
4. Age and overall health
5. Tolerance to specific medications, procedures, therapies

E Clinical findings

1. Signs and symptoms
  - a. Localized pain in affected site
  - b. Limp; voluntary curtailment of activity
  - c. Inability to hold heavy objects
  - d. Weight loss; frequent infections

F Confirmation of diagnosis

1. Radiographic examination; CT (bone); MRI; radioisotope bone scan
2. Bone marrow aspiration
3. Surgical biopsy (Ewing sarcoma)

G Therapeutic interventions

1. Osteosarcoma
  - a. Limb salvage procedure: resection of tumor with prosthetic bone replacement
  - b. Chemotherapy
    - (1) Preoperative: to reduce tumor size
    - (2) Pre- and postoperative: DOXOrubicin, cyclophosphamide (Cytosan), ifosfamide, carboplatin, cisplatin, high-dose methotrexate with leucovorin; medications singly or in combination
  - c. Amputation (rare)
2. Ewing sarcoma
  - a. Intensive irradiation of involved bone
  - b. Surgical removal of primary tumor
  - c. Chemotherapy: vincristine, cisplatin, DOXOrubicin, ifosfamide, etoposide
  - d. Amputation: for severe deformity as a result of radiation; if limb is useless

## ***Nursing Care of Adolescents with Bone Tumors***

### **Assessment/Analysis**

1. Location and extent of pain
2. Functional status of involved area
3. Inflammation at site; lymph node involvement
4. Systemic involvement

### **Planning/Implementation**

1. Provide preoperative and postoperative care

- a. Offer straightforward honest explanations
  - b. Answer questions and clarify misconceptions
  - c. Avoid overwhelming adolescent or parents with too much information
  - d. Emphasize lack of alternatives if amputation is planned
  - e. Provide care related to amputations (see [Chapter 11](#), Nursing Care of Clients with Neuromusculoskeletal System Disorders, Amputation, Nursing Care)
    - (1) Assist with becoming adept at using prosthesis
    - (2) Help select clothing to camouflage prosthesis
  - f. Use pain rating scale and medicate appropriately during postoperative period
2. Provide care related to radiation therapy for Ewing sarcoma
    - a. Explain procedure; explain side effects
    - b. Suggest and/or implement measures to reduce physical effects of radiotherapy
      - (1) Select loose-fitting cotton clothing over irradiated areas to decrease irritation
      - (2) Protect area from sunlight and sudden changes in temperature
      - (3) Avoid ice packs, heating pads
    - c. Help to cope with side effects of radiotherapy
  3. Support during chemotherapy
    - a. Explain procedure, stressing importance of chemotherapy
    - b. Explain probable side effects of antimetabolites (e.g., nausea, hair loss, stomatitis)
    - c. Administer antiemetics (e.g., ondansetron [Zofran]) to limit side effects of chemotherapy
    - d. Use nonpharmacologic means to minimize discomfort from chemotherapy (e.g., soft, nonirritating foods, soft-tipped applicator for oral hygiene)
    - e. Encourage hygiene, grooming, and items to enhance appearance (e.g., wig)
  4. Provide emotional support to adolescent and family members
    - a. Clarify misconceptions and provide technical information as needed
    - b. Provide time and opportunity for grieving
    - c. Encourage expression of feelings regarding loss and undesirable effects of therapy
    - d. Allow dependence while encouraging independence
    - e. Emphasize need for continuing regular activities, interactions, and behaviors

## Evaluation/Outcomes

1. Reports minimal pain
2. Resumes peer relationships and activities commensurate with abilities
3. Adolescent and parents
  - a. Express feelings and concerns
  - b. Demonstrate positive coping skills
  - c. Verbalize understanding of therapies and side effects
  - d. Adjust to alterations in adolescent's appearance

## Emotional Disorders

For common emotional disorders of the adolescent, see [Chapter 17](#), Nursing Care of

## Other Health Problems

Many problems of adolescence are similar to those of adults; see specific areas in Unit 2, Medical-Surgical Nursing, and Unit 4, Childbearing and Women's Health Nursing, for further discussions

# CHAPTER 35

# Child Health Nursing

---

## Review Questions with Answers and Rationales

### Questions

---

**Note:** Thousands of additional practice questions are available on the enclosed companion CD.

► Denotes alternate format question.

Questions generally are grouped by content and usually when it is first evident within a particular developmental level. Therefore, there will be some questions with children whose age is not specific to the broad classification of infants, toddlers, preschoolers, or adolescents.

# Nursing Care of Infants

► 1. The parents of a child call the clinic and tell the nurse that their child is irritable and has a 102° F temperature after having had a routine immunization. The clinic protocol indicates acetaminophen 15 mg/kg is to be administered every 4 to 6 hours. The child's last weight was 9.6 kg. The parent states, "The bottle of acetaminophen says that there are 160 mg in 5 mL." How much should the nurse tell the parent to administer for each dose? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

2. A family has decided to withhold "extraordinary care" for a newborn with severe abnormalities. How should the nurse interpret this decision?

1. The newborn has no rights.
2. It is the same as euthanasia.
3. It is illegal professional practice.
4. The newborn is being allowed to die.

3. A nurse is planning an initial home care visit to a mother who gave birth to a high-risk infant. For what time of day should the nurse schedule the visit for it to be **most** productive?

1. When the husband is out of the home.
2. At a time the mother is feeding the infant.
3. At a time that is convenient for the family.
4. When the nurse can spend time with the family.

4. What is the **first** action a nurse should take before administering a tube feeding to an infant?

1. Irrigate the tube with water.
2. Offer a pacifier to the infant.
3. Slowly instill 10 mL of formula.
4. Place the infant in the Trendelenburg position.

5. Which nursing intervention provides the **most** support to the parents of an infant with an obvious physical anomaly?

1. Encourage them to express their concerns.
2. Discourage them from talking about their baby.
3. Assure them not to worry because the anomaly can be repaired.
4. Show them postoperative photographs of infants who had similar anomaly.

6. When picked up by a parent or the nurse, an 8-month-old infant screams and seems to be in pain. After observing this behavior, what should the nurse discuss with the parent?

1. Accidents and the importance of their prevention
2. Limiting play time with other children in the family
3. Any other behaviors that the parent may have noticed
4. Food and specific vitamins that should be given to infants

7. A 1-week-old infant has been in the pediatric unit for 18 hours following placement of a spica cast. The nurse observes a respiratory rate of fewer than 24 breaths/min. No other changes are noted. Because the infant is apparently well, the nurse does not report or

documentation the slow respiratory rate. Several hours later, the infant experiences severe respiratory distress and emergency care is necessary. What should be considered if legal action is taken?

1. Most infants' respirations are slow when they are uncomfortable.
2. The respirations of young infants are irregular, so a drop in rate is unimportant.
3. Vital signs that are outside the expected parameters are significant and should be documented.
4. The respiratory tract of young infants is underdeveloped, and their respiratory rate is not significant.

► 8. What suggestions should a nurse give to a parent to help a 2-month-old infant who has colic? **Select all that apply.**

1. Give smaller, more frequent feedings.
2. Burp frequently when giving a feeding.
3. Place a warm heating pad on the abdomen.
4. Offer warm, sweetened tea when crying begins.
5. Rock the baby gently in a quiet room when crying begins.

► 9. A nurse at the well-child clinic determines a 1-year-old infant's length to be below what is expected. The current height is 28 inches, and the birth length was 20 inches. What should this infant's current length be? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ inches

10. What nursing intervention **best** meets a major developmental need of a newborn in the immediate postoperative period?

1. Giving a pacifier to the infant
2. Putting a mobile over the infant's crib
3. Providing the infant with a soft, cuddly toy
4. Warming the infant's formula before feeding

► 11. What characteristics does a nurse expect infants and young children who have failure to thrive to exhibit? **Select all that apply.**

1. Hyperactivity
2. Language deficit
3. Being overweight
4. Proneness to illness
5. Responsiveness to stimuli

12. A parent and 3-month-old infant are visiting the well-baby clinic for a routine examination. What should the nurse include in the accident prevention teaching plan?

1. Remove small objects from the floor.
2. Cover electric outlets with safety plugs.
3. Remove toxic substances from low areas.
4. Test the temperature of water before bathing.

13. A nurse is teaching a parent how to prevent accidents while caring for a 6-month-old infant. What ability should be emphasized about the infant's motor development?

1. Sits up
2. Rolls over

3. Crawls short distances
4. Stands while holding on to furniture
14. A 7-month-old girl is to be catheterized to obtain a sterile urine specimen. One of the infant's parents expresses fear that this procedure may traumatize the baby psychologically. How should the nurse provide reassurance?
  1. The fear is justified and the nurse should obtain a "clean catch" specimen.
  2. Parents have a right to refuse the catheterization and the concerns are realistic.
  3. Although the concern is appropriate, the need for a sterile specimen is the priority.
  4. The procedure is uncomfortable, but there should not be a damaging long-term effect.
15. A nurse is assessing the oral cavity of a 6-month-old infant. The parent asks which teeth will erupt first. How should the nurse respond?
  1. Incisors
  2. Canines
  3. Upper molars
  4. Lower molars
16. A nurse is teaching a class of new parents about how to position their infants during the first few weeks of life. Which position is safest?
  1. On the back, lying flat
  2. On either side, lying flat
  3. Head slightly elevated on the left side
  4. Head slightly elevated on the right side
17. A parent arrives in the emergency clinic with a 3-month-old baby who says, "My baby stopped breathing for a while." The infant continues to have difficulty breathing, with prolonged periods of apnea. Which assessment data should alert the nurse to suspect shaken baby syndrome (SBS)?
  1. Birth occurred before 32 weeks' gestation
  2. Lack of stridor and adventitious breath sounds
  3. Previous episodes of apnea lasting 10 to 15 seconds
  4. Retractions and use of accessory respiratory muscles
18. Parents of a sick infant talk with a nurse about their baby. One parent says, "I am so upset; I didn't realize our baby was ill." What **major** indication of illness in an infant should the nurse explain to the parent?
  1. Grunting respirations
  2. Excessive perspiration
  3. Longer periods of sleep
  4. Crying immediately after feedings
19. A newborn is admitted to the neonatal intensive care unit (NICU) with choanal atresia. Which part of the infant's body should the nurse assess?
  1. Rectum
  2. Nasopharynx
  3. Intestinal tract
  4. Laryngopharynx
20. What behavior does the nurse anticipate while feeding a newborn with choanal

atresia?

1. Chokes on the feeding
2. Has difficulty swallowing
3. Does not appear to be hungry
4. Takes about half of the feeding

► 21. An infant is admitted to the pediatric intensive care unit (PICU) after open-heart surgery for the repair of a ventricular septal defect. Place these nurse assessments in order of priority.

1. \_\_\_\_\_ Heart rate
2. \_\_\_\_\_ Operative site
3. \_\_\_\_\_ Urinary output
4. \_\_\_\_\_ Respiratory status
5. \_\_\_\_\_ Intravenous catheter

22. What is the nurse's **priority** intervention when preparing for admission of a child with acute laryngotracheobronchitis?

1. Pad the side rails of the crib.
2. Arrange for a quiet, cool room.
3. Place a tracheotomy set at the bedside.
4. Obtain a recliner so that a parent can stay.

23. What should be the nurse's **priority** action when caring for a child with acute laryngotracheobronchitis?

1. Initiate measures to reduce fever.
2. Ensure delivery of humidified oxygen.
3. Provide support to reduce apprehension.
4. Continually assess the respiratory status.

24. A 3-month-old infant has been hospitalized with respiratory syncytial virus (RSV). What is the **priority** intervention?

1. Administering an antiviral agent
2. Clustering care to conserve energy
3. Offering oral fluids to promote hydration
4. Providing an antitussive agent whenever necessary

► 25. The health care provider prescribes 375 mg ampicillin IV q6h for a 5-month-old with recurring respiratory infections. The drug is supplied as 500 mg of powder in a vial. The directions state to mix the powder with 1.8 mL diluent, which yields 250 mg/mL. How many milliliters should the nurse administer? **Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mL

26. A child is admitted to the hospital with pneumonia. What is the **priority** need that must be included in the nursing plan of care for this child?

1. Rest
2. Exercise
3. Nutrition
4. Elimination

27. A 6-month-old infant is brought to the emergency department in severe respiratory distress. A diagnosis of respiratory syncytial virus (RSV) is made and the infant is admitted to the pediatric unit. What should be included in the nursing plan of care?
1. Place in a warm, dry environment.
  2. Allow parents and siblings to visit.
  3. Maintain standard and contact precautions.
  4. Administer prescribed antibiotic immediately.
28. An infant is admitted to the neonatal intensive care unit (NICU) with exstrophy of the bladder. What covering should the nurse use to protect the exposed area?
1. Loose diaper
  2. Dry gauze dressing
  3. Moist sterile dressing
  4. Petroleum jelly gauze pad
29. An additional defect is associated with exstrophy of the bladder. For what anomaly should the nurse assess the infant?
1. Imperforate anus
  2. Absence of one kidney
  3. Congenital heart disease
  4. Pubic bone malformation
30. A nurse is caring for an infant born with exstrophy of the bladder. What does the nurse determine is the **greatest** risk for this infant?
1. Infection
  2. Dehydration
  3. Urinary retention
  4. Intestinal obstruction
31. A home care nurse is visiting a family for the first time. The 4-week-old infant had surgery for exstrophy of the bladder and creation of an ileal conduit soon after birth. When the nurse arrives, the mother appears tired and the baby is crying. After an introduction, which is the **most** appropriate statement by the nurse?
1. "Tell me about your daily routine."
  2. "You look tired. Is everything all right?"
  3. "When was the last time the baby had a bottle?"
  4. "Oh, it looks like you two are having a bad day."
32. The nurse is teaching a parent group about the reason for adhering to the immunization schedule. What complication of mumps is important for adolescents to avoid?
1. Sterility
  2. Hypopituitarism
  3. Decrease in libido
  4. Decrease in androgens
33. A nurse is performing a physical examination on an infant with Down syndrome. For what anomaly should the nurse assess the child?
1. Bulging fontanel

2. Stiff lower extremities
  3. Abnormal heart sounds
  4. Unusual pupillary reactions
34. A parent tells the nurse, "My 9-month-old baby no longer has the same strong grasp that was present at birth and no longer acts startled by loud noises." How should the nurse explain these changes in behavior?
1. "I will check these responses before deciding how to proceed."
  2. "Failure of these responses may be related to a developmental delay."
  3. "Additional sensory stimulation is needed to aid in the return of these responses."
  4. "These responses are replaced by voluntary activity at about five months of age."
35. The nurse is teaching a group of parents about the side effects of the immunization vaccines. Which sign should the nurse include when talking about an infant receiving the *Haemophilus influenzae* (Hib) vaccine?
1. Lethargy
  2. Urticaria
  3. Generalized rash
  4. Low-grade fever
- ▶ 36. An infant is receiving parenteral therapy. The IV orders are 400 mL of D5W 0.45% sodium chloride to run over 8 hours. At what rate should the nurse maintain the hourly rate? **Record your answer using a whole number.**
- Answer: \_\_\_\_\_ mL
37. An infant who has had diarrhea for 3 days is admitted in a lethargic state and is breathing rapidly. The parent states that the baby has been ingesting formula, although not as much as usual, and cannot understand the sudden change. What explanation should the nurse give the parent?
1. Cellular metabolism is unstable in young children.
  2. The proportion of water in the body is less than in adults.
  3. Renal function is immature in children until they reach school age.
  4. The extracellular fluid requirement per unit of body weight is greater than in adults.
38. When explaining the occurrence of febrile seizures to a parents' class, what information should the nurse include?
1. They may occur in minor illnesses.
  2. The cause is usually readily identified.
  3. They usually do not occur during the toddler years.
  4. The frequency of occurrence is greater in females than males.
39. A parent tells the nurse in the emergency department, "My 3-year-old has had a fever for several days and has been vomiting." After instituting ordered measures to reduce the fever, what nursing action is **most** important?
1. Preventing shivering
  2. Restricting oral fluids
  3. Measuring output hourly
  4. Taking vital signs hourly
40. The nurse observes that a 3-year-old child in a crib has a clamped jaw and is having a

tonic-clonic seizure. What is the **priority** nursing responsibility at this time?

1. Apply restraints.
2. Administer oxygen.
3. Protect the child from self-injury.
4. Insert a plastic airway in the child's mouth.

41. A child sitting on a chair in a playroom starts to have a tonic-clonic seizure with a clenched jaw. What is the nurse's **best** initial action?

1. Attempt to open the jaw.
2. Place the child on the floor.
3. Call out for assistance from staff.
4. Place a pillow under the child's head.

► 42. A nurse is caring for a child with the diagnosis of meningitis. What clinical findings indicate an increase in intracranial pressure? **Select all that apply.**

1. Irritability
2. Bradycardia
3. Hyperalertness
4. Decreased pulse pressure
5. Decreased systolic blood pressure

43. An infant is diagnosed with communicating hydrocephalus. The parents ask for clarification of the health care provider's explanation of their baby's problem. How should the nurse respond?

1. "Too much spinal fluid is produced within the spaces (ventricles) of the brain."
2. "The flow of spinal fluid through the brain cells does not empty effectively into the spinal cord."
3. "The spinal fluid is prevented from adequate absorption by a blockage in the spaces (ventricles) of the brain."
4. "There is a part of the brain surface that usually absorbs spinal fluid after its production that is not functioning adequately."

44. A 6-week-old infant and the mother arrive in the emergency department via ambulance. The father arrives several minutes later with two children, 7 and 9 years old. The infant is not breathing, and the eventual diagnosis is sudden infant death syndrome (SIDS). The parents take turns holding the infant in another room. The nurse remains present and provides emotional support to the parents. What is an important short-term goal for this family?

1. Identify the problems that they will be facing related to the loss of the infant.
2. Include the infant's siblings in the events and grieving following the infant's death.
3. Seek out other families who have lost infants to SIDS and receive support from them.
4. Accept that there was nothing that they should have done to prevent the infant's death.

45. What should be included in the nursing care of an infant with increased intracranial pressure?

1. Weigh daily before feeding.
2. Elevate the head higher than the hips.

3. Check the reflexes at regular intervals.
4. Monitor alertness with frequent stimulation.
46. The parents of an infant who just had a ventriculoperitoneal shunt inserted for hydrocephalus are concerned about the prognosis. What information should the nurse give the parents?
  1. The prognosis is excellent and the valve is permanent.
  2. The shunt may need to be revised as the child grows older.
  3. If any brain damage has occurred, it is irreversible even after the first year of life.
  4. Hydrocephalus usually is self-limiting by 2 years of age, and then the shunt is removed.
47. An infant who was born with a meningomyelocele develops hydrocephalus. A ventriculoperitoneal shunt is inserted. What nursing intervention is **essential** in this infant's care during the first 24 hours after surgery?
  1. Placing in high-Fowler position
  2. Administering the prescribed sedative
  3. Positioning on the same side as the shunt
  4. Monitoring for increasing intracranial pressure
48. The discharge of a newborn with a surgically repaired myelomeningocele is anticipated at about 2 weeks of age. What teaching should the nurse include when preparing the parents for the discharge?
  1. Demonstration of restrictive positions to prevent the infant from turning
  2. Discussion about the need to limit the infant's fluid intake to formula only
  3. Instructions on how to do passive range-of-motion exercises to the infant's lower extremities
  4. Explanation of the need to provide the infant with a quiet environment to reduce external stimuli
- 49. An infant who had a revision of a ventriculoperitoneal shunt is diagnosed with meningitis from an infected shunt. What clinical manifestations support this conclusion? **Select all that apply.**
  1. Fever
  2. Lethargy
  3. Stiff neck
  4. Poor feeding
  5. Depressed fontanel
50. A nurse in the pediatric clinic is assessing an infant who had a revision of a ventriculoperitoneal shunt. What clinical finding alerts the nurse that intracranial pressure has increased?
  1. Increased pulse rate
  2. Hypoactive reflexes
  3. Decreased blood pressure
  4. Tension of the anterior fontanel
51. The parents of an infant who has had a surgical repair of a myelomeningocele express concern about skin care and ask what they can do to avoid problems. The nurse should

teach the parents that their infant:

1. will require long-term multidisciplinary follow-up care.
2. should take prophylactic antibiotic therapy indefinitely.
3. must be kept dry by applying powder after each diaper change.
4. does not need anything more than routine cleansing and diaper changes.

52. What is the **primary** nursing intervention for an infant with a myelomeningocele before surgical correction?

1. Minimize infection.
2. Prevent trauma to the sac.
3. Observe for increasing paralysis.
4. Assess the degree of bowel and bladder control.

53. An infant with a myelomeningocele is admitted to the pediatric intensive care unit (PICU). While the infant is awaiting surgical correction of the defect, what is the **most** appropriate nursing intervention?

1. Using disposable diapers
2. Placing the infant in the prone position
3. Performing neurologic checks above the site of the lesion
4. Washing the area below the defect with a nontoxic antiseptic

54. After closure of a newborn's myelomeningocele, what **essential** nursing intervention must be included in the plan of care?

1. Limiting leg movement
2. Decreasing environmental stimuli
3. Measuring head circumference daily
4. Observing for serous drainage from the nares

55. A nurse is caring for an infant with bacterial meningitis. The parents ask how their baby could have contracted the illness. What does the nurse consider as the **most** likely route of transmission to the central nervous system (CNS)?

1. Genitourinary tract
2. Gastrointestinal tract
3. Skin or mucous membranes
4. Cranial apertures or sinuses

► 56. The nurse is admitting an 8-month-old infant to the hospital because bacterial meningitis is suspected. List in order of priority the nursing actions that should be taken.

1. \_\_\_\_\_ Institute respiratory isolation.
2. \_\_\_\_\_ Assist with a lumbar puncture.
3. \_\_\_\_\_ Insert a circulatory access device.
4. \_\_\_\_\_ Administer prescribed antibiotics.
5. \_\_\_\_\_ Monitor for signs of nuchal rigidity

57. For how long should a nurse maintain isolation of a child with bacterial meningitis?

1. For 12 hours after admission
2. Until the cultures are negative
3. Until antibiotic therapy is completed
4. For 48 hours after antibiotic therapy begins

58. A 1-year-old infant has been admitted with a tentative diagnosis of bacterial meningitis. A lumbar puncture is performed to confirm the diagnosis. What laboratory report of the spinal fluid supports this diagnosis?

1. Decreased cell count
2. Elevated protein level
3. Increased glucose level
4. Low spinal fluid pressure

59. A nurse is caring for a child with meningococcal meningitis. What clinical finding does the nurse expect when performing a physical assessment?

1. Severe glossitis
2. Low-grade fever
3. Purpuric skin rash
4. Tremors of the extremities

► 60. A nurse is caring for a 2-year-old child with meningitis. For which clinical manifestations of increasing intracranial pressure should the nurse assess the child?

**Select all that apply.**

1. Seizures
2. Vomiting
3. Bulging fontanel
4. Subnormal temperature
5. Decreased respiratory rate

61. What does a nurse determine is the **most** serious complication of meningitis in young children?

1. Epilepsy
2. Blindness
3. Peripheral circulatory collapse
4. Communicating hydrocephalus

62. The nurse observes that an infant has asymmetric gluteal folds. For which disorder should the nurse perform a focused assessment?

1. Congenital inguinal hernia
2. Central nervous system damage
3. Peripheral nervous system damage
4. Developmental dysplasia of the hip

63. A 3-month-old infant with severe developmental dysplasia of the hip has a hip spica cast applied. What should the nurse teach the parents to prevent a serious complication?

1. Change diapers frequently.
2. Decrease the number of feedings per day.
3. Avoid turning from prone to supine positions.
4. Call the health care provider if there is a foul smell.

64. A 4-month-old infant had a spica cast applied. What should the nurse include in the discharge instructions to the parents?

1. Obtain a specially designed car seat.
2. Keep diapers on to prevent soiling of the cast.

3. Change the infant's position every eight hours.
4. Use the bar between the infant's legs to change positions.
65. What procedure should a nurse use when elevating the head of an infant in a spica cast?
  1. Change this position after an hour.
  2. Place pillows under the shoulders.
  3. Pad the edge of the cast with folded diapers.
  4. Raise the entire mattress at the head of the crib.
66. A nurse is caring for a 3-month-old infant who is diagnosed with congenital hypothyroidism. What should the parents be told of the probable effect on the infant's future if treatment is not begun immediately?
  1. Myxedema
  2. Thyrotoxicosis
  3. Spastic paralysis
  4. Mental retardation
67. At a visit to the well-baby clinic, the parents are upset because their 9-month-old infant has a severe diaper rash; one parent wants to know how to treat it and prevent it from recurring. What cause of diaper dermatitis should the nurse include when answering the parent's question?
  1. Use of disposable diapers
  2. Prolonged contact with an irritant
  3. Decreased pH of the infant's urine
  4. Too early introduction of solid foods
68. A parent brings a 2-week-old infant to the clinic because the infant continually regurgitates. Chlasia, an incompetent cardiac sphincter, is suspected. What instructions should the nurse give the parent?
  1. Keep the infant in an upright position after feedings.
  2. Prevent the infant from crying for prolonged periods.
  3. Keep the infant in the prone position following feedings.
  4. Ensure that the infant drinks a full bottle of formula at each feeding.
69. A parent brings a 9-month-old infant to the pediatric clinic and asks about the introduction of new foods. What should the nurse suggest?
  1. "Mix the pureed food with formula and offer it in a bottle."
  2. "Give the entire regular feeding and then introduce the new food."
  3. "Offer a new food every day until one is accepted and then offer it again."
  4. "Give a small amount of formula and then offer the new food while still hungry."
70. What should nursing care for an infant after the surgical repair of a cleft lip include?
  1. Preventing crying
  2. Placing in a semi-Fowler position
  3. Keeping NPO for 1 day after surgery
  4. Feeding with a spoon for 2 days after surgery
71. A nurse who is caring for an infant with a cleft lip is concerned about preventing an infection. Why does the cleft lip predispose the infant to infection?

1. Waste products accumulate along the defect.
  2. There is inadequate circulation in the defective area.
  3. Nutrition is inadequate because of ineffective feeding.
  4. Mouth breathing dries the oropharyngeal mucous membranes.
72. What should a nurse use to feed an infant born with a unilateral cleft lip and palate?
1. Plastic spoon
  2. Cross-cut nipple
  3. Parenteral infusion
  4. Rubber-tipped syringe
73. A parent of an 11-month-old infant who has a cleft palate asks the nurse why it was recommended that closure of the palate should be done before the age of 2. How should the nurse respond?
1. "After age 2 surgery is frightening and should be avoided if possible."
  2. "Eruption of the 2-year molars often complicates the surgical procedure."
  3. "As your child gets older, the palate gets wider and more difficult to repair."
  4. "Surgery should be performed before your child starts to use faulty speech patterns."
- 74. An infant has a cleft lip and palate and is admitted to the hospital for a surgical repair. Place the nurse's postoperative interventions in order of priority.
1. \_\_\_\_\_ Preventing vomiting
  2. \_\_\_\_\_ Maintaining a patent airway
  3. \_\_\_\_\_ Assessing the infant's hearing status
  4. \_\_\_\_\_ Monitoring parenteral fluid infusions
  5. \_\_\_\_\_ Teaching the parents alternate feeding methods
75. An infant with hypertrophic pyloric stenosis (HPS) is admitted to the pediatric unit. What does the nurse expect when palpating the infant's abdomen?
1. A distended colon
  2. Marked tenderness around the umbilicus
  3. An olive-sized mass in the right upper quadrant
  4. Rhythmic peristaltic waves in the lower abdomen
76. A nurse is caring for an infant with a tentative diagnosis of hypertrophic pyloric stenosis (HPS). What is **most** important for the nurse to assess?
1. Quality of the cry
  2. Signs of dehydration
  3. Coughing up of feedings
  4. Characteristics of the stool
77. Surgery to correct hypertrophic pyloric stenosis (HPS) is performed on a 3-week-old infant who had been formula-fed. Which postoperative feeding order is appropriate?
1. Thickened formula 24 hours after surgery
  2. Withholding feedings for the first 24 hours
  3. Regular formula feeding within 24 hours after surgery
  4. Additional glucose feedings as desired after first 24 hours
78. Corrective surgery for hypertrophic pyloric stenosis (HPS) is completed, and the infant is returned to the pediatric unit with an IV infusion in place. What is the **priority**

nursing action?

1. Apply adequate restraints.
2. Administer a mild sedative.
3. Assess the IV site for infiltration.
4. Attach the nasogastric tube to wall suction.

79. An infant had corrective surgery for hypertrophic pyloric stenosis (HPS). What should the nurse teach a parent to do immediately after a feeding to limit vomiting?

1. Rock the infant.
2. Place the infant in an infant seat.
3. Place the infant flat on the right side.
4. Keep the infant awake with sensory stimulation.

80. A newborn with an anorectal anomaly had an anoplasty performed. At the 2-week follow-up visit, a series of anal dilations are begun. What should the nurse recommend to the parents to help prevent the infant from becoming constipated?

1. Use a soy formula.
2. Breastfeed if possible.
3. Administer a suppository nightly.
4. Offer glucose water between feedings.

81. A nurse is caring for an infant with phenylketonuria (PKU). What diet should the nurse anticipate will be ordered by the health care provider?

1. Fat-free
2. Protein-enriched
3. Phenylalanine-free
4. Low-phenylalanine

82. What should the nurse include in the teaching plan for parents of an infant diagnosed with phenylketonuria (PKU)?

1. Mental retardation occurs if PKU is untreated.
2. Testing for PKU is done immediately after birth.
3. Treatment for PKU includes lifelong medications.
4. PKU is transmitted by an autosomal dominant gene.

83. The parents of a newborn with phenylketonuria (PKU) need help and support in adhering to specific dietary restrictions. They ask the nurse, "How long will our child have to be on this diet?" How should the nurse respond?

1. "We still are not sure; you should discuss this with your health care provider."
2. "If your baby does well, foods containing protein can gradually be introduced."
3. "Your child needs to be on this diet at least through adolescence and into adulthood."
4. "This is a lifelong problem, and it is recommended that dietary restrictions must be continued."

84. A nurse plans to discuss childhood nutrition with a group of parents whose children have Down syndrome in an attempt to minimize a common nutritional problem. What problem should be addressed?

1. Rickets
2. Obesity

3. Anemia

4. Rumination

► 85. A nurse is caring for a 3-month-old infant whose abdomen is distended and whose vomitus is bile stained. The nurse suspects an intestinal obstruction. What clinical manifestations support this suspicion? **Select all that apply.**

1. Weak pulse

2. Hypotonicity

3. Paroxysmal pain

4. High-pitched cry

5. Grunting respirations

86. A nurse is discussing the care of an infant with colic with the parents. What should the nurse explain is the cause of colicky behavior?

1. Inadequate peristalsis

2. Paroxysmal abdominal pain

3. An allergic response to certain proteins in milk

4. A protective mechanism designed to eliminate foreign proteins

87. A 1-month-old infant is admitted to the pediatric unit with a tentative diagnosis of Hirschsprung disease (congenital aganglionic megacolon). What procedure does the nurse expect to be used to confirm the diagnosis?

1. Colonoscopy

2. Rectal biopsy

3. Multiple saline enemas

4. Fiberoptic nasoenteric tube

88. A health care provider orders a tap water enema for a 6-month-old infant with suspected Hirschsprung disease. What rationale causes the nurse to question the order?

1. The result could be loss of necessary nutrients.

2. It could cause a fluid and electrolyte imbalance.

3. It could increase the fear of intrusive procedures.

4. The result could cause shock from a sudden drop in temperature.

89. An order is written for an isotonic enema for a 2-year-old child. What is the maximum amount of fluid the nurse should administer without a specific order from the health care provider?

1. 100 to 150 mL

2. 155 to 250 mL

3. 255 to 360 mL

4. 365 to 500 mL

90. A 5-month-old infant develops severe diarrhea and is given IV fluids. What is the rationale for the nurse to closely monitor the IV flow rate?

1. Limiting output

2. Replacing lost fluids

3. Avoid IV infiltration

4. Preventing cardiac overload

91. What is an **essential** nursing action when caring for a young child with severe

diarrhea?

1. Maintain the IV.
2. Take daily weights.
3. Replace the lost calories.
4. Promote perianal skin integrity.

92. A nurse is caring for an infant whose vomiting is intractable. For what complication is it **most** important for the nurse to assess?

1. Acidosis
2. Alkalosis
3. Hyperkalemia
4. Hyponatremia

93. A nurse is administering IV fluids to a dehydrated infant. What intervention is **most** important at this time?

1. Continuing the prescribed flow rate
2. Monitoring the intravenous drop rate
3. Calculating the total necessary intake
4. Maintaining the fluid at body temperature

94. A 5-month-old infant is brought to the pediatric clinic for a routine monthly examination. What assessment alerts the nurse to notify the health care provider?

1. Temperature of 99.5° F
2. Blood pressure of 75/48 mm Hg
3. Heart rate of 100 beats per minute
4. Respiratory rate of 50 breaths per minute

95. A nurse is reviewing the clinical records of infants and children with cardiac disorders who developed heart failure. What did the nurse determine is the last sign of heart failure?

1. Tachypnea
2. Tachycardia
3. Peripheral edema
4. Periorbital edema

96. What is a common finding that the nurse can identify in most children with symptomatic cardiac malformations?

1. Mental retardation
2. Inherited genetic factors
3. Delayed physical growth
4. Clubbing of the fingertips

97. A 1-year-old child has a congenital cardiac malformation that causes right-to-left shunting of blood through the heart. What clinical finding should the nurse expect?

1. Proteinuria
2. Peripheral edema
3. Elevated hematocrit
4. Absence of pedal pulses

98. The parents of a child who is scheduled for open-heart surgery ask why their child

must be subjected to chest tubes after surgery. What should the nurse consider before responding in language the parents will understand?

1. They will increase tidal volumes.
2. Drainage of air and fluid will be facilitated.
3. They will maintain positive intrapleural pressure.
4. Pressure on the pericardium and chest wall will be regulated.

99. After a discussion with the health care provider, the parents of an infant with patent ductus arteriosus (PDA) ask the nurse to explain once again what PDA is. How should the nurse respond?

1. The diameter of the aorta is enlarged.
2. The wall between the right and left ventricles is open.
3. It is a narrowing of the entrance to the pulmonary artery.
4. It is a connection between the pulmonary artery and the aorta.

100. A nurse is caring for a child with a cardiac malformation associated with left-to-right shunting. What does the nurse consider to be the **major** characteristic of this type of congenital disorder?

1. Elevated hematocrit
2. Severe growth retardation
3. Clubbing of the fingers and toes
4. Increased blood flow to the lungs

101. A young child has coarctation of the aorta. What does the nurse expect to identify when taking the child's vital signs?

1. A weak radial pulse
2. An irregular heartbeat
3. A bounding femoral pulse
4. An elevated radial blood pressure

102. A 2-week-old infant is admitted with a tentative diagnosis of a ventricular septal defect. The parents report that their baby has had difficulty feeding since coming home after the birth. What should the nurse consider before responding?

1. Feeding problems are common in neonates.
2. Inadequate sucking is not significant in the absence of cyanosis.
3. Ineffective sucking and swallowing may be early indications of a heart defect.
4. Many neonates retain mucus, and this may interfere with feeding for several weeks.

103. A 3-year-old child is scheduled for a cardiac catheterization. What is the **priority** nursing care after this procedure?

1. Encouraging early ambulation
2. Monitoring the site for bleeding
3. Restricting fluids until the blood pressure is stabilized
4. Comparing the blood pressure of both lower extremities

104. A parent brings a 2-month-old infant with Down syndrome to the pediatric clinic for a physical and administration of immunizations. The nurse performs an initial physical assessment. Which clinical finding should alert the nurse to perform a further assessment?

1. Flat occiput
  2. Small, low-set ears
  3. Circumoral cyanosis
  4. Protruding furrowed tongue
105. Which cardiac defects are associated with tetralogy of Fallot?
1. Right ventricular hypertrophy, atrial and ventricular defects, and mitral valve stenosis
  2. Origin of the aorta from the right ventricle and of the pulmonary artery from the left ventricle
  3. Right ventricular hypertrophy, ventricular septal defect, pulmonic stenosis, and overriding aorta
  4. Altered connection between the pulmonary artery and the aorta, right ventricular hypertrophy, and an atrial septal defect
106. A nurse is reviewing the laboratory report of a child with tetralogy of Fallot that indicates an elevated RBC count. What does the nurse identify as the cause of the polycythemia?
1. Low blood pressure
  2. Tissue oxygen needs
  3. Diminished iron level
  4. Hypertrophic cardiac muscle
107. What clinical manifestation of tetralogy of Fallot should the nurse expect when caring for children with this diagnosis?
1. Slow respirations
  2. Clubbing of fingers
  3. Decreased RBC counts
  4. Subcutaneous hemorrhages
108. A child undergoes heart surgery to repair the defects associated with tetralogy of Fallot. What behavior is **essential** for the nurse to prevent postoperatively?
1. Crying
  2. Coughing
  3. Straining at stool
  4. Unnecessary movement
109. An infant who had cardiac surgery for a congenital defect is to be discharged. What should the nurse emphasize to the parents when they administer the prescribed antibiotic?
1. Give the antibiotic between feedings.
  2. Ensure that the antibiotic is administered as prescribed.
  3. Shake the bottle thoroughly before giving the antibiotic.
  4. Keep the antibiotic in the refrigerator after the bottle has been opened.
110. An infant with a congenital heart defect is being given gavage feedings. The parents ask the nurse why this is necessary. How should the nurse respond?
1. "It limits the chance of vomiting."
  2. "It allows the feeding to be administered rapidly."
  3. "The energy that would have been expended on sucking is conserved."

4. "The quantity of nutritional liquid can be regulated better than with a bottle."
111. The parents of a 6-week-old infant who was born without an immune system ask a nurse why their baby is still so healthy. How should the nurse reply?
1. Exposure to pathogens during this time can be limited.
  2. Some antibodies are produced by the infant's colonic bacteria.
  3. Antibodies are passively received from the mother through the placenta and breast milk.
  4. Fewer antibodies are produced by the fetal thymus during the eighth and ninth months of gestation.
112. When evaluating the laboratory report of a 1-year-old infant's hematocrit, a nurse compares it with the expected hematocrit range for this age group. What is the hematocrit of a healthy 12-month-old infant?
1. 19% to 32%
  2. 29% to 41%
  3. 37% to 47%
  4. 42% to 69%
113. What explanation should the nurse give a parent about the purpose of a tetanus toxoid injection for her child?
1. Passive immunity is conferred for life.
  2. Long-lasting active immunity is conferred.
  3. Lifelong active natural immunity is conferred.
  4. Passive natural immunity is conferred temporarily.
- ▶ 114. The parents of a 4-year-old child who is receiving prednisone asks a nurse why some of the booster immunizations are being postponed. The nurse explains that administering live attenuated virus vaccines is contraindicated for children receiving corticosteroids because they make them more susceptible to infection. Which are safe for the child to receive? **Select all that apply.**
1. Rubeola
  2. Pertussis
  3. Varicella
  4. Inactivated poliovirus
  5. Tetanus immune globulin
115. A school nurse is teaching parents of school-age children about the importance of immunizations for the childhood communicable diseases. What preventable disease may cause the complication of encephalitis?
1. Varicella
  2. Scarlet fever
  3. Poliomyelitis
  4. Whooping cough
116. A parent asks a nurse how to tell the difference between measles (rubeola) and German measles (rubella). What should the nurse tell the parent about rubeola that is different from rubella?
1. High fever and Koplik spots

2. Rash on the trunk with pruritus
3. Nausea, vomiting, and abdominal cramps
4. Characteristics of a cold, followed by a rash

117. The parents of an infant ask the nurse why their baby is scheduled to receive the intramuscular polio vaccine rather than the oral vaccine. What is the nurse's **best** response?

1. "The American Academy of Pediatrics recommends the intramuscular vaccine because it is safer."
2. "The consensus is that either can be used, since both produce the same results and are equally safe."
3. "The oral vaccine is more expensive, so the intramuscular vaccine is preferred unless it is contraindicated."
4. "The U.S. Centers for Disease Control and Prevention recommends the intramuscular vaccine unless the infant or a family member is immunocompromised."

118. A nurse is teaching parents about why most children should be immunized against varicella (chickenpox) and why some receiving specific medications should not. Which medication should be included in the discussion?

1. Insulin
2. Steroids
3. Antibiotics
4. Anticonvulsants

119. A nurse is teaching a class about immunizations to members of a grammar school's Parent-Teachers Association. Which childhood disease is the nurse discussing when explaining that it is a viral disease that starts with malaise and a highly pruritic rash that begins on the abdomen, spreads to the face and proximal extremities, and can result in grave complications?

1. Rubella
2. Rubeola
3. Chickenpox
4. Scarlet fever

120. The parent of a child who has received all of the primary immunizations asks the nurse which ones the child should receive before starting kindergarten. The nurse tells the parent that her child should receive boosters of:

1. IPV, HepB, Td.
2. DTaP, HepB, Td.
3. MMR, DTaP, Hib.
4. DTaP, IPV, MMR.

121. A nurse is reviewing the immunization schedule of an 11-month-old infant. What immunizations does the nurse expect the infant to have previously received?

1. Pertussis, tetanus, polio, and measles
2. Diphtheria, pertussis, tetanus, and polio
3. Rubella, polio, tuberculosis, and pertussis
4. Measles, mumps, rubella, and tuberculosis

122. During a vaccination drive at a well-child clinic, a nurse observes that a recently hired nurse is not wearing gloves. What should the nurse advise the newly hired nurse to do?

1. Speak with the nurse manager regarding techniques.
2. Put on gloves because standard precautions are required.
3. Continue with the immunizations because gloves are not needed.
4. Evaluate the child's appearance to determine whether gloves are needed.

123. A 12-month-old infant has become immunosuppressed during a course of chemotherapy. When preparing the parents for the infant's discharge, what information should the nurse give concerning the measles, mumps, and rubella (MMR) immunization?

1. It should not be given until the infant reaches 2 years of age.
2. Infants who are receiving chemotherapy should not be given these vaccines.
3. It should be given to protect the infant from contracting any of these diseases.
4. The parents should discuss this with their health care provider at the next visit.

124. A parent and 4-year-old child who recently emigrated from Colombia arrive at the pediatric clinic. The child has a temperature of 102° F, is irritable, and has a runny nose. Inspection reveals a rash and several small, red, irregularly shaped spots with blue-white centers in the mouth. What illness does the nurse suspect the child has?

1. Measles
2. Chickenpox
3. Fifth disease
4. Scarlet fever

# Nursing Care of Toddlers

► 125. A health care provider prescribes amoxicillin 145 mg by mouth three times daily for a 28-lb toddler. It is supplied as a suspension of 250 mg/5 mL. The safe dosage is 35 mg/kg/24 hours. How many milligrams within the safe dosage limit is the dose?

**Record your answer using one decimal place.**

Answer: \_\_\_\_\_ mg

126. A parent calls the outpatient clinic requesting information about the appropriate dose of acetaminophen for a 16-month-old child who has signs of an upper respiratory tract infection and fever. The directions on the bottle of acetaminophen elixir are 120 mg every 4 hours when needed. At the toddler's 15-month visit, the health care provider prescribed 150 mg. What is the nurse's **best** response to the parent?

1. "The dose is close enough, and it doesn't really matter which one is given."
2. "From your description, the medications are not necessary. They should be avoided at this age."
3. "It is appropriate to use dosages based on age. Children typically have weights consistent for their age groups."
4. "The prescribed dose of the drug was based on weight, and this is a more accurate way of determining a therapeutic dose."

127. A nurse in the emergency department observes large welts and scars on the back of a child who has been admitted for an asthma attack. What additional information must be included in the nurse's assessment?

1. History of an injury
2. Signs of child abuse
3. Presence of food allergies
4. Recent recovery from chickenpox

128. The parents of a 2-year-old child tell the nurse that they are having difficulty disciplining their child. What is the nurse's **most** appropriate response?

1. "This is a difficult age that your child is going through right now."
2. "Tell me more about your difficulty. I'm not sure what you mean by this."
3. "It's important to be consistent with toddlers when they need disciplining."
4. "I can understand what you mean. That's why this age is called the terrible twos."

129. A 13-year-old girl tells the nurse at the pediatric clinic that she took a pregnancy test and it was positive. She adds that her grandfather, with whom she, her younger sisters, and her mother live, has repeatedly molested her for the past 3 years. When the nurse asks the girl if she has told this to anyone, she replies, "Yes, but my mother doesn't believe me." Legally, who should the nurse notify?

1. Police concerning a possible sex crime
2. Health care provider to confirm the pregnancy
3. Child Protective Services for immediate intervention
4. Girl's mother about the pregnancy test's positive result

130. Where should the nurse manager place a 5-year-old child admitted with injuries that may be related to abuse?

1. In a private room
  2. With an older, friendly child
  3. With a child of the same age
  4. In a room near the nurses' desk
131. What is one of the **most** important factors that a nurse must consider when parents of a toddler request to be present at a procedure occurring on the hospital unit?
1. Type of procedure to be performed
  2. Individual assessment of the parents
  3. Whether the toddler wants the parents present
  4. Probable reaction to the toddler's response to pain
132. At 2 years of age, a child is readmitted to the hospital for additional surgery. What is the **most** important factor in preparing the toddler for this experience?
1. Gratification of the child's wishes
  2. Previous experience of being hospitalized
  3. Avoidance of leaving the child with strangers
  4. Assurance of continuation of parental affection
133. On the third day of hospitalization the nurse observes that a 2-year-old toddler who had been screaming and crying inconsolably begins to regress and is now lying quietly in the crib with a blanket. What stage of separation anxiety has developed?
1. Denial
  2. Despair
  3. Mistrust
  4. Rejection
134. What behavior does a nurse expect from a toddler subjected to prolonged hospitalization with limited parental visits?
1. Cheerful interactions with staff members
  2. Indications of sadness throughout the day
  3. Excessive crying when parents are not present
  4. Limited emotional response to the environment
135. During the second week of hospitalization for intravenous antibiotic therapy, a 2-year-old toddler whose family is unable to visit often smiles easily, goes to all the nurses happily, and does not express interest in the parent when the parent does visit. The parent tells the nurse, "I am pleased about the adjustment but somewhat concerned about my child's reaction to me." How should the nurse respond?
1. The child is repressing feelings for the parent.
  2. Routines have been established and the child feels safe.
  3. The child has given up fighting and accepts the separation.
  4. Behavior has improved because the child feels better physically.
- 136. The nurse accompanies a 3-year-old child to the playroom. The toddler seems afraid to select a toy or activity. What age-appropriate play material should the nurse offer?
- Select all that apply.**
1. Plastic tea set
  2. Mold and clay

3. Play telephone
4. Pencil and paper
5. Simple video game

137. When teaching a group of parents in the daycare center about accident prevention, the nurse explains that young toddlers are prone to injuries from falls. When receiving feedback, the nurse identifies that more teaching is needed when one parent states, "I will:

1. keep medications in a medicine cabinet."
2. have secured gates at entrances to staircases."
3. move our child to a regular bed by the age of  $2\frac{1}{2}$ ."
4. buy shoes that close with Velcro rather than laces."

► 138. A  $2\frac{1}{2}$ -year-old child is admitted to the hospital with deep partial thickness burns involving the face and chest. The nurse develops a plan of care based on concerns related to the child's injury. Place the following in order of importance.

1. \_\_\_\_\_ Presence of pain
2. \_\_\_\_\_ Potential for infection
3. \_\_\_\_\_ Impaired gas exchange
4. \_\_\_\_\_ Disturbed fluid balance
5. \_\_\_\_\_ Compromised body image

139. A 3-year-old child ingests a substance that may be a poison. The parent calls a neighbor who is a nurse and asks what to do. What should the nurse recommend the parent to do?

1. Administer syrup of ipecac.
2. Call the poison control center.
3. Take the child to the emergency department.
4. Give the child bread dipped in milk to absorb the poison.

► 140. A nurse in the child life center is evaluating a 15-month-old toddler's ability to perform physical tasks. What behavior indicates to the nurse that the child's development is age appropriate? **Select all that apply.**

1. Shares toys.
2. Drinks from a cup.
3. Builds a tower of six blocks.
4. Walks with a wide-based gait.
5. Throws toys around the room.

141. A parent brings an 18-month-old toddler to the clinic. The parent states, "My child is so difficult to please, has temper tantrums, and annoys me by throwing food from the table." What is the nurse's **best** response?

1. "Toddlers need discipline to prevent the development of antisocial behaviors."
2. "Toddlers are learning to assert independence, and this behavior is expected at this age."
3. "It is best to leave the toddler alone in the crib after calmly explaining why the behavior is unacceptable."
4. "This is the way a toddler expresses needs, and this behavior is acceptable during the

initiative stage of development.”

142. A parent tells a nurse at the clinic, “Each morning I offer my 24-month-old child juice, and all I hear is ‘No.’ What should I do because I know my child needs fluid?” What strategy should the nurse suggest?

1. Offer the child a choice of two juices.
2. Distract the child with a favorite food.
3. Offer the child the glass in a firm manner.
4. Allow the child to see the parent getting angry.

143. A 2-year-old child who was admitted to the hospital for further surgical repair of a clubfoot is standing in the crib, crying. The child refuses to be comforted and calls for the mother. As the nurse approaches the crib to provide morning care, the child screams louder. Knowing that this behavior is typical of the stage of protest, what is the **most** appropriate nursing intervention?

1. Use comforting measures while holding the child.
2. Fill the basin with water and proceed to bathe the child.
3. Sit by the crib and bathe the child later when the anxiety decreases.
4. Postpone the bath for a day because a child this upset should not be traumatized further.

144. A major developmental milestone of a toddler is the achievement of autonomy. What should the nurse instruct the parents to do to enhance their toddler’s need for autonomy?

1. Teach the child to share with others.
2. Help the child to learn society’s roles.
3. Teach the child to accept external limits.
4. Help the child to develop internal controls.

► 145. The nurse observes a 2-year-old child at play and identifies that the child is engaging in age-appropriate behavior for a toddler. Which activities lead the nurse to this conclusion? **Select all that apply.**

1. Is possessive of toys
2. Follows simple directions
3. Can play simple card games
4. Enjoys playing with other children
5. Attempts to stay within the lines when coloring

146. After the nurse has completed an oral examination of a healthy 2-year-old child, the parent asks when the child should first be taken to the dentist. When is the **most** appropriate time in the child’s life for the nurse to suggest?

1. Before starting school
2. Within the next few months
3. When the first deciduous teeth are lost
4. At the next time a family member visits the dentist

147. The nurse explains to the parent of a 2-year-old child that the toddler’s negativism is expected at this age. What need is this behavior meeting?

1. Trust

2. Attention
3. Discipline
4. Independence

148. The parent of a 2-year-old child tells a nurse at the clinic, "Whenever I go to the store, my child has a screaming tantrum, demanding a toy or candy on the shelves. How can I deal with this situation?" What is the nurse's **best** response?

1. "Attempt to distract the child by offering the child a toy"
2. "Say nothing and allow the tantrum to continue until it ends."
3. "Have a baby sitter stay with the child at home until the child outgrows this behavior."
4. "Give the child the item while in the store, and when the child loses interest, return the item to the shelf."

149. What foods should a nurse order for a 30-month-old toddler on a regular diet?

1. Hamburger with bun and grapes
2. Chicken fingers and french fries
3. Hot dog with bun and potato chips
4. Macaroni and cheese and Cheerios

150. During a nap, a 3-year-old hospitalized child wets the bed. How should the nurse respond?

1. Ask the child to help with remaking the bed.
2. Put clean sheets on the bed over a rubber sheet.
3. Change the child's clothes without discussing the incident.
4. Explain that children should call the nurse when they need to go to the bathroom.

151. A nurse is evaluating a 3-year-old child's developmental progress. The inability to perform which task indicates to the nurse that there is a developmental delay?

1. Copying a square
2. Hopping on one foot
3. Catching a ball reliably
4. Using a spoon effectively

► 152. Which healthy snack should the nurse teach the parents to give their 2-year-old child who has the diagnosis of acute asthma? **Select all that apply.**

1. Grapes
2. Ice cream
3. Apple slices
4. Oatmeal cookies
5. Cut up vegetables
6. Cold glass of milk

153. What type of play does a nurse expect when observing a toddler in a playroom with other children?

1. Parallel
2. Solitary
3. Cooperative
4. Competitive

154. While assessing an 18-month-old child, a nurse observes that the toddler can crawl

upstairs but needs assistance when climbing the stairs upright. What does this action indicate to the nurse?

1. Presence of talipes equinovarus
2. Reflective of neurologic damage
3. Expected behavior in a toddler of this age
4. Existence of developmental dysplasia of the hip

► 155. What toys should a nurse offer a young toddler during hospitalization? **Select all that apply.**

1. Mobile
2. Tricycle
3. Pounding toy
4. Carton of clay
5. Ten-piece puzzle

156. A parent tearfully tells a nurse, "They think our child is developmentally delayed. We are thinking about investigating a preschool program for cognitively impaired children." What is the nurse's **most** appropriate response?

1. Praise the parent for the decision and encourage the plan.
2. Ask for more specific information related to the developmental delays.
3. Advise the parent to have the health care provider help choose an appropriate program.
4. Explain that this may be a premature action and the developmental delays could disappear.

157. A nurse on the pediatric unit is observing the developmental skills of several 2-year-old children in the playroom. Which child should the nurse continue to evaluate?

1. Cannot stand on 1 foot
2. Builds a tower of 7 blocks
3. Uses echolalia when speaking
4. Colors outside the lines of a picture

158. A nurse plans to talk to the parents of a toddler about toilet training. What should the nurse explain is the **most** important factor in the process of toilet training?

1. Parents' attitude about it
2. Child's desire to remain dry
3. Child's ability to sit still on the toilet
4. Parents' willingness to work at the toilet training

159. A parent asks the nurse what to do when their toddler has temper tantrums. What play materials should the nurse suggest to offer the child as another way of expressing anger?

1. Ball and bat
2. Wad of clay
3. Punching bag
4. Pegs and pounding board

160. When the working mother of a toddler is preparing to take her child home after a prolonged hospitalization, she asks the nurse what type of behavior she should expect to

be displayed. What is the nurse's **most** appropriate description of her child's probable behavior?

1. Excessively demanding behavior
2. Hostile attitude toward the mother
3. Cheerful, with shallow attachment behaviors
4. Withdrawn, without emotional ties to the mother

161. A 15-month-old child with the diagnosis of hydrocephalus is to have a computed tomography (CT) scan. What should the nurse include when preparing the toddler for the CT scan?

1. Shaving the head
2. Starting the prescribed IV infusion
3. Administering the prescribed sedative
4. Giving the child a simple explanation of the procedure

162. An 8-year-old child with cerebral palsy is admitted to the hospital for a tendon-lengthening procedure. After the surgery, the parents ask a nurse why their child must wear braces and shoes for at least 12 hours a day even while in bed. How should the nurse respond?

1. "Ambulation can be encouraged as soon as possible."
2. "They maintain body alignment and help prevent footdrop."
3. "They stretch your child's ligaments and strengthen muscle tone."
4. "It helps your child accept the physical constraints of the condition."

163. What safety precautions should a nurse teach a child with diminished sensation in the legs because of cerebral palsy?

1. Test the temperature of the water before a bath.
2. Tighten brace straps securely before ambulating.
3. Set the clock twice during the night to change position.
4. Look down at the legs when crutch walking to determine how they are positioned.

164. When planning long-term care for a child with cerebral palsy (CP), it is important for the nurse to consider that the:

1. illness is not progressively degenerative.
2. effects of cerebral palsy are unpredictable.
3. child probably has some degree of mental retardation.
4. child should have genetic counseling before planning a family.

165. A school nurse is teaching a group of teachers' aides about the cause of lead poisoning in children. What is important to consider in terms of prevention?

1. It is known to be caused by the ingestion of foods that are high in fat.
2. It is attributed to an indigent and passive parent who fails to supervise the children.
3. Environmental factors are involved because lead is available for ingestion and inhalation.
4. Socioeconomic factors are involved, because inadequately maintained old buildings have more lead-based paint.

166. A nurse is assessing a child with plumbism (lead poisoning). Which organ system is of **most** concern because of its irreversible side effects?

1. Urinary
2. Skeletal
3. Nervous
4. Hematologic

167. A nurse is assessing a child with the diagnosis of lead poisoning. What is the **most** harmful adverse effect that the nurse anticipates?

1. Inadequate nutrition
2. Delayed development
3. Anemia and constipation
4. Renal and skeletal damage

168. If a child cannot be given or is not responding to oral chelating agents, parenteral medication must be used. To effectively prepare a child to cope with this painful treatment, what is the **priority** nursing intervention?

1. Rotating the injection sites and adding procaine to the chelating agent to lessen the discomfort
2. Role-playing with puppets dressed as hospital personnel to minimize the child's fear of unfamiliar adults
3. Explaining the rationale for the injections so that the child does not view them as a punishment for bad behavior
4. Therapeutic play using a needleless syringe and a doll before therapy is initiated and after receiving each injection

169. A nurse encourages parents to have their young children's eyes tested especially for monocular strabismus. What should the nurse explain can occur if it is not corrected early?

1. Dyslexia will develop.
2. Peripheral vision will disappear.
3. Vision in both eyes will be diminished.
4. Amblyopia will progress in the weak eye.

170. A nurse is teaching the parents of a 2-year-old child the correct way to administer ear drops. After explaining that they position their child on the side, how should they move the pinna while instilling the drops?

1. Forward
2. Up and back
3. Straight back
4. Down and back

171. A nurse talks with parents of a toddler with strabismus about why this condition should be treated in early childhood. What complication should the nurse explain can occur if it is not corrected?

1. Cataracts
2. Glaucoma
3. Refractive errors
4. Partial loss of sight

172. The nurse observes that a 6-month-old infant is startled by a loud noise but does not

turn in the direction of the sound. How should the nurse interpret this response?

1. Effect of vision deficits
2. Evidence of hearing loss
3. Low-normal hearing range
4. Developmentally appropriate

173. After many episodes of otitis media, a 3-year-old child is to have a myringotomy with tubes implanted surgically. What should the nurse include in the discharge preparation for this family?

1. Keep the child at home for one week.
2. Insert earplugs during the child's bath.
3. Apply an ointment to the ear canal daily.
4. Use cotton swabs to clean the inner ears.

174. During a well-child visit the parents tell a nurse, "Our 3-year-old child does not listen to us when we speak and ignores us." After an auditory screening, it is determined that the child has a mild hearing loss. What should the nurse explain to the parents about a mild hearing loss?

1. A severe hearing deficit may develop.
2. It will not interfere with progress in school.
3. An immediate follow-up visit is not necessary.
4. Speech therapy in addition to hearing aids may be required.

► 175. A child sustains multiple fractures from a motor vehicle collision and casts are applied. The child is admitted for observation to rule out internal injuries. The health care provider orders vital signs, including blood pressures, every 4 hours. The nurse decides to use the posterior tibial artery to obtain the blood pressure. Place a line across the extremity where the blood pressure cuff should be positioned to obtain this blood pressure.

176. A young child with a leg fracture of suspicious origin is brought into the emergency department by the mother and the mother's boyfriend. It is the child's first visit to this hospital. After assessing the child, a nurse anticipates that the health care provider will order a skeletal survey. Why is a skeletal survey the preferred diagnostic tool?

1. The exact location and extent of the fracture will be pinpointed.
2. It is the first step toward a complete assessment before a CT scan and an MRI are done.
3. Three separate x-ray films of the leg and hip should be ordered, making it more cost effective.
4. The skeletal history of the current fracture and any previous healing or healed fractures are identified.

► 177. A 9-year-old child has a fractured tibia, and a full leg cast is applied. Which assessments should the nurse immediately report to the health care provider? **Select all that apply.**

1. Increased urinary output
2. Inability to move the toes
3. Pedal pulse of 90 beats/min
4. Tingling sensation in the foot
5. Fiberglass cast that is damp after 4 hours

178. An infant has a plaster cast applied for clubfoot correction. What nursing intervention will hasten drying of the cast?

1. Using a blow dryer
2. Opening the window
3. Exposing the casted extremity
4. Covering the cast with a light sheet

► 179. A child just had a cast applied for a fractured wrist. The wrist and elbow are immobilized. What information should the nurse include in the home care instructions before discharge? **Select all that apply.**

1. Resume usual activities.
2. Report swelling of fingers.
3. Elevate casted arm when standing.
4. Keep affected shoulder immobilized.
5. Lower the casted arm when lying down.

180. A 3-year-old child is admitted with partial- and full-thickness burns over 30% of the body. What significant adverse outcome during the first 48 hours should the nurse attempt to prevent?

1. Shock
2. Pneumonia
3. Contractures
4. Hypertension

181. A 6-year-old child has partial-thickness burns of the face and upper chest. What is the **priority** nursing assessment for the first 24 hours?

1. Wound sepsis
2. Pulmonary distress
3. Fear and separation anxiety
4. Fluid and electrolyte imbalance

► 182. A 15-year-old adolescent is admitted with partial- and full-thickness burns of the arms and upper torso. What are the purposes of administering pain medication via the intravenous route rather than the intramuscular route? **Select all that apply.**

1. Adolescents are afraid of injections.
2. It decreases the risk for tissue irritation.
3. Severe pain is reduced more effectively.
4. Impaired peripheral circulation is bypassed.
5. It provides for more prolonged relief of pain.

183. What should the nurse teach parents is the **major** influence on the eating habits of early school-age children?

1. Smell and appearance of food
2. Availability of food selections
3. Food preferences of the peer group
4. Example of parents and siblings at mealtimes

184. A child receives a gastrostomy tube feeding every 4 hours. What is the **priority** nursing intervention for this child?

1. Open the tube one hour before feeding.
2. Keep the child lying flat during the feeding.
3. Flush the tube with normal saline after feeding.
4. Position the child on the right side after feeding.

185. An unconscious child requires intermittent nasogastric feedings. When should the nurse check placement of the tube?

1. Once a day
2. Before each feeding
3. At every shift change
4. During the night shift

186. A nurse is obtaining a health history from the parents of a child with celiac disease. What characteristic does the nurse expect when the parents describe their child's stools?

1. Small, pale, mucoid
2. Large, frothy, green
3. Large, pale, foul-smelling
4. Moderate, green, foul-smelling

187. The parents of a 6-year-old child with celiac disease tell the school nurse that their child becomes dejected because of not being able to eat "snack" food like the rest of the children. What snack can the nurse recommend that is safe for the child to eat?

1. Pretzels
2. Tortilla chips
3. Oatmeal cookies
4. Peanut butter crackers

188. The parents of a child newly diagnosed with cystic fibrosis tell a nurse that even though they were told it is an inherited disorder there is no history of cystic fibrosis in the family. How can the nurse clarify the way it was inherited?

1. It is a mutated gene.
2. It involves an X-linked gene.
3. The inheritance is autosomal recessive.
4. The inheritance is autosomal dominant.

189. The parents of a child newly diagnosed with cystic fibrosis ask a nurse what causes the problems related to this disorder. What should the nurse consider about the primary pathology before responding?

1. Hyperactivity of the eccrine (sweat) glands
2. Hypoactivity of the autonomic nervous system
3. Mechanical obstruction of mucus-secreting glands
4. Atrophic changes in the mucosal lining of the intestines

190. The parents of a child newly diagnosed with cystic fibrosis ask a nurse what causes the foul-smelling, frothy stool. What should be included in the nurse's answer?

1. Undigested fat
2. Sodium and chloride
3. Lipase, trypsin, and amylase
4. Partially digested carbohydrates

191. A child with cystic fibrosis has been hospitalized with bacterial pneumonia. The nurse determines that the child has no known allergies. What does the nurse conclude about the reason the health care provider selected a specific antibiotic?

1. Tolerance of the child
2. Sensitivity of the bacteria
3. Selectivity of the bacteria
4. Preference of the health care provider

192. A nurse is assessing a school-age child with cystic fibrosis. What complication of frequent stools and tenacious mucus does the nurse anticipate?

1. Anal fissures
2. Rectal prolapse
3. Intussusception
4. Meconium ileus

193. A nurse teaches a 5-year-old child with cystic fibrosis how to use an inhaler. What is the **most** appropriate way to evaluate understanding of the technique?

1. Asking questions about using the inhaler
2. Showing the nurse how to use the inhaler
3. Explaining how the inhaler will be used at home
4. Telling the nurse about the technique that was learned

► 194. A 7-year-old child with cystic fibrosis is receiving an intravenous antibiotic. The medication is supplied in a 125-mL bag of 0.45% sodium chloride. It is to be infused over 30 minutes. At what rate should the infusion pump be set to deliver the medication in the prescribed time? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL/hour

195. What is an important nursing intervention during the care of a hospitalized child with cystic fibrosis?

1. Discourage coughing.
2. Perform postural drainage.
3. Encourage active exercise.
4. Provide small, frequent feedings.

196. When is the **most** appropriate time for the nurse to plan for chest percussion and postural drainage for a toddler with cystic fibrosis?

1. After suctioning
2. Before aerosol therapy
3. One hour before meals
4. Fifteen minutes after meals

197. A child with cystic fibrosis has recurrent episodes of bronchitis and the parents ask the nurse why this happens. What reason should the nurse include in the reply?

1. Associated heart defects cause heart failure and respiratory depression.
2. Neuromuscular irritability causes spasm and constriction of the bronchi.
3. Tenacious secretions that obstruct the respiratory tract provide a favorable medium for growth of bacteria.
4. Elevated salt content in saliva irritates the mucous membranes, resulting in inflammation of the nasopharynx.

198. What should a nurse teach the parents of a toddler newly diagnosed with cystic fibrosis about the administration of vitamins A, D, E, and K?

1. Offer them in a water-miscible form.
2. Give them during meals and snack time.
3. Calibrate them based on height and weight.
4. Present them with fruit juice rather than milk.

► 199. Which medications does the nurse expect to be prescribed for a child newly diagnosed with cystic fibrosis? **Select all that apply.**

1. Steroids
2. Antibiotics
3. Antihistamines
4. Pancreatic enzymes
5. Fat-soluble vitamins

200. A nurse can assist in confirming a suspected diagnosis of intestinal infestation with pinworms in a 6-year-old child by:

1. teaching the mother the procedure for an anal cellophane-tape test.
2. asking the mother to collect stools for 3 consecutive days for culture.
3. having the mother bring in the child's stools for visual examination for 3 days.
4. assisting the mother to schedule a hypersensitivity test of the child's blood serum.

201. A nurse teaches a parent how to perform a cellophane-tape test for pinworms. At what time should the nurse teach the parent to perform the test?

1. Immediately after meals

2. Following a bowel movement
  3. At bedtime before the child's bath
  4. Early morning before the child gets up
202. Pinworms cause a number of symptoms besides anal itching. A complication of pinworm infestation, although rare, that the nurse should be aware of is:
1. hepatitis.
  2. stomatitis.
  3. pneumonitis.
  4. appendicitis.
203. Mebendazole (Vermox) is prescribed for a child with pinworms. For whom should this medication also be prescribed?
1. The child's infant brother
  2. People using the same toilet facilities as the child
  3. Members of the child's family after they test positive
  4. The child's immediate family members even if they are symptom-free
204. The health care provider prescribes mebendazole (Vermox) for a 4-year-old child with pinworms. What should the nurse prepare the parents to expect when they observe the child's stool?
1. Blood
  2. Constipation
  3. Yellow color
  4. Passage of worms
205. A nurse working at a summer camp is informed of an outbreak of scabies. For what clinical indicator should the nurse screen the children?
1. Pruritic, threadlike lesions in skin folds
  2. Grayish white particles adhering to hair shafts
  3. Central necrotic ulcer surrounded by petechiae
  4. Reddened, round areas of alopecia over the scalp
206. The parent of a 14-month-old toddler asks the nurse about how to proceed with bowel training. What should the nurse recommend to optimize success?
1. Place the child on the toilet every 2 hours.
  2. Start by having the child sit on a potty chair.
  3. Avoid bowel training until the child is 2 years old.
  4. Begin before the child's diet consists mainly of solid foods.
207. A nurse is planning for the discharge of a child after a sickle cell vaso-occlusive crisis (pain episode). What is **most** important for the nurse to emphasize?
1. A high-calorie diet
  2. A rigorous exercise regimen
  3. An increased intake of fluids
  4. An increase in the hours spent sleeping
208. A child is to receive a blood transfusion. What should the nurse do **first** if an allergic reaction to the blood occurs?
1. Shut off the infusion.

2. Slow the rate of flow.
  3. Administer an antihistamine.
  4. Call the health care provider.
209. When counseling the parents of a child with anemia related to an inadequate diet, a nurse explains that several different nutrients are involved. These nutrients include protein, iron, and vitamin B<sub>12</sub>. What other nutrient should the nurse include?
1. Calcium
  2. Thiamine
  3. Folic acid
  4. Riboflavin
- 210. A nurse is developing a teaching plan for a child who has anemia related to inadequate nutrition. In addition to iron, which nutrients should the nurse include that are necessary for RBC synthesis? **Select all that apply.**
1. Protein
  2. Calcium
  3. Vitamin C
  4. Vitamin D
  5. Carbohydrates
211. A pale, lethargic 1-year-old infant weighs 12.6 kg (28 lb) and has a hemoglobin level of 9 g/dL. The parent tells the nurse that the infant refuses solid food when it is offered by spoon and drinks between four and six full bottles of milk per day. What should the nurse recommend?
1. Begin the weaning process immediately.
  2. Take the infant to the metabolic clinic for an examination.
  3. Give the infant finger foods such as dry cereal and chopped meat.
  4. Puncture a large hole in the nipple and add puréed baby foods to the milk.
212. A nurse is performing health screening of toddlers in a culturally diverse neighborhood. Which child should the nurse consider at risk for  $\beta$ -thalassemia (Cooley anemia)?
1. Two-year-old child of Greek descent with a large abdomen
  2. Eighteen-month-old child of Irish descent with very pale skin color
  3. Three-year-old child of Spanish descent with an increased hematocrit
  4. Twenty-month-old child of Asian descent with edematous knee joints
213. A child with  $\beta$ -thalassemia (Cooley anemia) is admitted to the ambulatory care unit for a transfusion. What instructions should the nurse include in the discharge plan?
1. Encourage fluids.
  2. Restrict activities.
  3. Protect from infections.
  4. Offer small meals frequently.
214. A child with sickle cell disease has a sequestration crisis. The parents ask how it differs from a painful episode (vaso-occlusive crisis). What should the nurse consider before responding?
1. There is peripheral ischemia along with the pain.

2. There is decreased blood volume and signs of shock.
  3. Red blood cell production diminishes with severe anemia.
  4. Red blood cell destruction is accelerated and jaundice appears.
215. A nurse is caring for a child with sickle cell anemia. What is the **priority** nursing intervention to prevent thrombus formation in capillaries and the stasis and clotting of blood that occur in the sickling process?
1. Encourage fluids.
  2. Encourage bed rest.
  3. Administer oxygen.
  4. Administer prescribed anticoagulants.
216. A child is admitted to the pediatric unit with a hemoglobin level of 6.4 g/dL. What should be the nurse's **priority** assessment?
1. Manifestations of shock
  2. Increased white cell count
  3. Presence of hemoglobinuria
  4. Signs of cardiac decompensation
217. A child in sickle cell crisis (painful episode) reports right knee pain. What should the nurse anticipate the health care provider will order?
1. Wrap the knee in a cold pack.
  2. Apply a warm soak to the knee.
  3. Administer 0.5 mg of morphine.
  4. Decrease the amount of IV fluids.
218. What nursing care to prevent a crisis is the same for children with sickle cell anemia and celiac disease?
1. Limit activity.
  2. Protect from infection.
  3. Document color and consistency of stools.
  4. Offer a low-carbohydrate, high-protein, low-fat diet.
- 219. A 6-year-old child with sickle cell disease is admitted with a vaso-occlusive crisis (painful episode). What are the **priority** nursing concerns? **Select all that apply.**
1. Nutrition
  2. Hydration
  3. Pain management
  4. Prevention of infection
  5. Oxygen supplementation

# Nursing Care of Preschoolers

220. A 4-year-old child is brought to the emergency department after falling on the handlebars of a tricycle. The child is guarding the abdomen, crying, and not allowing any physical contact with the staff. Which action **best** enables the nurse to initiate the assessment process?

1. Medicate the child for pain before proceeding.
2. Allow the child to guide the examiner's hand to the area that hurts.
3. Have the parents restrain the child while the abdomen is auscultated.
4. Suggest the health care provider order a computed tomography of the child's abdomen.

221. The parents of a  $4\frac{1}{2}$ -year-old child are concerned about the effects of hospitalization on their child. Which behavior should the nurse expect the child to exhibit?

1. Refuse to cooperate with the nurses when the parents are absent
2. Demonstrate despair if the parents do not visit at least once a day
3. Cry when the parents leave and return but not during their absence
4. Be unable to relate to children in the playroom if other parents are present

222. A 4-year-old child is diagnosed with acute lymphoblastic leukemia (ALL). One of the parents tells the nurse, "We just had a discussion with our pediatrician about induction chemotherapy, consolidation therapy, and radiation therapy. We are so confused and don't know what to do. We want to do what is best for our child, but we don't want any unnecessary suffering." What is the nurse's **best** response?

1. "The new treatment protocols have shown to have excellent results."
2. "There are support groups for parents with children who have leukemia."
3. "Let me get you the telephone number of the Leukemia Society, where you can get some advice."
4. "Maybe you could talk with your health care provider about getting a second opinion from a specialist in leukemia."

223. A child with nephrotic syndrome has repeated relapses. As the child gets older, what is **most** important for the nurse to help the child develop?

1. A positive body image
2. The ability to test urine
3. Fine muscle coordination
4. Acceptance of possible sterility

224. A 4-year-old child with nephrotic syndrome is being treated with corticosteroid therapy. A nurse reviews the laboratory reports of the child's urine to evaluate if the treatment has been effective. Which of the following should decrease?

1. Polyuria
2. Hematuria
3. Glycosuria
4. Proteinuria

225. A 4-year-old child being admitted for surgery arrives on the ambulatory surgical unit crying and pulling at the hospital gown while clutching a teddy bear. What is the nurse's

**best** response?

1. "Please stop crying. Nobody will hurt you."
2. "Hello, I'm your nurse. Let's go and see your room."
3. "I know you feel scared. This must be your special teddy bear."
4. "We want you to be happy here. Let's go to the playroom and play."

226. A nurse is caring for a preschooler who is being prepared for surgery. What does the nurse expect to have the **most** influence on the child's response to hospitalization?

1. Fear of separation
2. Fear of bodily harm
3. Belief in death's finality
4. Belief in the supernatural

227. What is a nurse's **best** approach when preparing a 4-year-old child for an otoscopic examination?

1. "This tube will feel like a pencil in your ear."
2. "You can help by holding this tube while I get ready."
3. "Please try to sit very still while I'm looking through the tube."
4. "It won't hurt a bit when I look into your ear through this tube."

228. When a nurse brings a dinner tray to a 4-year-old child hospitalized with pneumonia, the child says, "I'm too sick to feed myself." How should the nurse respond?

1. "Try to eat as much as you can."
2. "You can eat later when you feel better."
3. "Wait a few minutes, and I will be back to help you."
4. "You're really not that sick, and I'm sure you can feed yourself."

229. What is the **best** way for a nurse to meet a 3-year-old child sitting in the waiting room of the pediatric clinic?

1. Walk into the waiting room to greet the child.
2. Call the child by name at the waiting room door.
3. Ask the receptionist to bring the child into the examining room.
4. Stand at the examining room door while the child walks down the hall.

230. A child recovering from a severe asthma attack is given predniSONE 15 mg po twice daily. What is the **priority** nursing intervention?

1. Prevent exposing the child to infection.
2. Have the child rest as much as possible.
3. Check the child's eosinophil count daily.
4. Offer nothing by mouth to the child except oral medications.

231. A child with acute lymphoid leukemia (ALL) is started on chemotherapy protocol that includes predniSONE. What side effect of this medication does the nurse anticipate?

1. Alopecia
2. Anorexia
3. Weight loss
4. Mood changes

232. A nurse is caring for a child with acute lymphoid leukemia who is receiving chemotherapy. The parents ask why the child needs predniSONE. How should the nurse

respond?

1. It decreases inflammation.
2. Production of lymphocytes is suppressed.
3. It increases appetite and a sense of well-being.
4. Irradiation skin irritation and edema are reduced.

► 233. A prescription for predniSONE reads 10 mg four times per day. The dose for children is 2 mg/kg/day. How many pounds does the child weigh? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ pounds

234. A combination of drugs, including vinCRISTine and predniSONE, is prescribed for a child with leukemia. For what adverse effect should the nurse assess the child that indicates vinCRISTine toxicity?

1. Hemolytic anemia
2. Irreversible alopecia
3. Gastrointestinal problems
4. Neurologic complications

235. A young child with acute nonlymphoid leukemia is admitted to the pediatric unit with a fever and neutropenia. What are the **most** appropriate nursing interventions to minimize the complications associated with neutropenia?

1. Placing the child in a private room, restricting ill visitors, and using strict handwashing techniques
2. Encouraging a well-balanced diet, including iron-rich foods, and helping the child avoid overexertion
3. Avoiding rectal temperatures, limiting injections, and applying direct pressure for five minutes after venipuncture
4. Offering a moist, bland, soft diet; using toothettes rather than a toothbrush; and providing frequent saline mouthwashes

236. A nurse is teaching a class of nursing assistants about the differences in providing care among various age groups. Which age group of children does the nurse explain makes the provision of nursing care the **most** challenging?

1. From 1 to 4 years of age
2. Between 6 and 8 years old
3. Between 6 and 12 months old
4. From birth to 6 months of age

237. A nurse in the child life center encourages preschool children to engage in role-playing. The nurse considers this an important part of socialization because it:

1. helps children think about careers.
2. teaches children about stereotypes.
3. encourages expression of concerns.
4. provides guidelines for adult behavior.

238. The nurse observes that a 4-year-old child is having difficulty relating with some of the children in the playroom. What does the nurse identify is the reason that this problem is not unexpected with preschoolers?

1. At this age they engage only in parallel play.
  2. At this age they are extremely dependent on their parents.
  3. Fierce temper tantrums and negativism are typical behaviors.
  4. Exaggerating and boasting to impress others are typical behaviors.
239. Parents express concerns to the nurse that their 4-year-old child is spending a large amount of time playing with an imaginary playmate. How should the nurse respond?
1. "Perhaps your child needs more interaction with friends."
  2. "You have reason to be concerned. This is not typical behavior."
  3. "Imaginary playmates are an important part of a young child's life."
  4. "This is a sign of social immaturity. I recommend psychological counseling."
240. A nurse is caring for a preschooler on the pediatric unit. What does the nurse identify as the child's **greatest** fear at this age?
1. Death
  2. Mutilation
  3. Painful procedures
  4. Isolation from peers
241. A nurse is attempting to involve a hospitalized preschooler in therapeutic play. Why is this so important?
1. The child can work out ways of coping with fears.
  2. It provides an opportunity to accept the hospital situation.
  3. The child can forget the reality of the situation for a little while.
  4. It provides an opportunity to meet other children on the pediatric unit.
242. What nursing intervention is **most** effective in alleviating the fretfulness of a hospitalized 5-year-old child?
1. Reading a story to the child
  2. Giving a jigsaw puzzle to the child
  3. Supplying the child with videos to watch
  4. Offering the child crayons with drawing paper
243. A 5-year-old child is admitted to the pediatric intensive care unit with a diagnosis of acute asthma. A blood sample is obtained to measure the child's arterial blood gases. What finding does the nurse expect?
1. High oxygen level
  2. Elevated alkalinity
  3. Decreased bicarbonate
  4. Increased carbon dioxide level
244. When planning discharge teaching for the parents of a child with asthma, what information should the nurse include?
1. Avoid foods high in fat.
  2. Stay at home for two weeks.
  3. Increase the protein and calorie intake.
  4. Minimize exertion and exposure to cold.
- 245. When preparing a child with asthma for discharge, what must the nurse emphasize to the family? **Select all that apply.**

1. Eliminate allergens in the home.
  2. Maintain a dry home environment.
  3. Avoid placing limits on the child's behavior.
  4. Continue the medications even if the child is asymptomatic.
  5. Prevent exposure to infection by having the child tutored at home.
- 246. A child with a history of asthma is brought to the emergency department experiencing an acute exacerbation of asthma. Which nursing assessments support this conclusion? **Select all that apply.**
1. Fever
  2. Crackles
  3. Wheezing
  4. Tachycardia
  5. Hypotension
247. A child has been admitted to the pediatric unit with a severe asthma attack. What type of acid-base imbalance should the nurse expect the child to develop?
1. Metabolic alkalosis caused by excessive production of acid metabolites
  2. Respiratory alkalosis caused by accelerated respirations and loss of carbon dioxide
  3. Respiratory acidosis caused by impaired respirations and increased formation of carbonic acid
  4. Metabolic acidosis caused by the kidneys' inability to compensate for increased carbonic acid formation
248. After a tonsillectomy, which finding alerts the nurse to suspect the initial stage of hemorrhage?
1. Noisy snoring
  2. Asking for water
  3. Frequent swallowing
  4. Gradual onset of pallor
249. A child has a tonsillectomy and adenoidectomy for numerous recurrent respiratory tract infections. Postoperatively what should the nurse teach the parents to do?
1. Offer ice chips on which to suck.
  2. Encourage the intake of ice cream.
  3. Keep the child in the supine position.
  4. Gargle with a diluted mouthwash solution.
250. A 4-year-old child is diagnosed with mucocutaneous lymph node syndrome (Kawasaki disease). The child is admitted to the pediatric unit and the nurse performs an initial assessment. What clinical finding supports this diagnosis?
1. Strawberry tongue
  2. Copious discharges from the eyes
  3. Insidious onset of low-grade fever
  4. Maculopapular rash on the extremities
251. What is the **most** important nursing intervention for a 3-year-old child with a diagnosis of nephrotic syndrome?
1. Regulating diet

2. Encouraging fluids
3. Preventing infection
4. Maintaining bed rest

252. A child with nephrotic syndrome visits the clinic for a follow-up visit. During the visit the parent states that the child is always tired and has no appetite. The nurse observes that the child has a muddy, pale complexion. What problem does the nurse suspect?

1. Impending renal failure
2. Being too active in school
3. Developing a viral infection
4. Refusing the prescribed medications

253. A health care provider lists orders for a young child with a tentative diagnosis of Wilms tumor. Which order should the nurse question?

1. MRI
2. CT scan
3. Renal biopsy
4. Abdominal ultrasound

► 254. A child who has been receiving prolonged steroid therapy develops a cushingoid appearance. What will the nursing assessment probably reveal? **Select all that apply.**

1. Truncal obesity
2. Thin extremities
3. Increased linear growth
4. Loss of hair on the body
5. Decreased blood pressure

255. A 3-year-old preschooler has been hospitalized with nephrotic syndrome. What is the **best** way for the nurse to evaluate fluid retention or loss?

1. Weigh daily at the same time.
2. Have the child urinate in a bedpan.
3. Measure the abdominal girth daily.
4. Test the child's urine for proteinuria.

► 256. A nurse is caring for a child newly diagnosed with acute lymphoblastic leukemia (ALL). What clinical findings does the nurse anticipate when assessing the child? **Select all that apply.**

1. Pallor
2. Fatigue
3. Jaundice
4. Multiple bruises
5. Generalized edema

257. A 4-year-old child newly diagnosed with leukemia is admitted for chemotherapy. While assisting with morning care, the nurse observes bloody expectorant after the child has brushed the teeth. How should the nurse respond to this occurrence?

1. Secure a smaller toothbrush for the child to use.
2. Document the incident without alarming the child.

3. Tell the child to be more careful when brushing the teeth.
  4. Rinse the child's mouth with half-strength hydrogen peroxide.
258. A 3-year-old child who has acute lymphoblastic leukemia (ALL) is scheduled to receive cranial radiation. The nurse should explain to the parents that radiation will:
1. avoid the need for chemotherapy.
  2. reduce the risk for systemic infection.
  3. limit metastasis to the lymphatic system.
  4. prevent central nervous system involvement.

# Nursing Care of School-Age Children

259. A 6-year-old child begins thumb-sucking after surgery. This was not the child's behavior preoperatively. What is the **best** action for the nurse to take?

1. Accept the thumb-sucking.
2. Distract the child by playing checkers.
3. Report this behavior to the health care provider.
4. Tell the child that thumb-sucking causes buckteeth.

260. Two second-graders are brought to the school health office after a fight during gym class. What should the school nurse say to the children?

1. "Why did you do this?"
2. "Tell me what happened."
3. "You are both in a lot of trouble."
4. "How many fights have you two had?"

261. What should be a school nurse's **first** action when a child tells the nurse of a sore throat?

1. Examine the throat.
2. Have the child sent home.
3. Take the child's temperature.
4. Secure a prescription for an oral analgesic.

262. An 8-year-old child who has been receiving chemotherapy will soon return to school after a prolonged absence. Classmates are aware that the child is being treated for cancer. How should the school nurse prepare the class for the child's return to school?

1. Encourage the students to think about how they feel toward their classmate.
2. Explain to the students why it is important to tolerate those who are different.
3. Ask the students not to make fun of their classmate because of lost weight and having no hair.
4. Initiate a discussion with the students about cancer treatments and the side effects of chemotherapy.

► 263. A child who is known to have the human immunodeficiency virus (HIV) is admitted to the hospital with the diagnosis of *Pneumocystis jiroveci* pneumonia. The nurse administers the prescribed trimethoprim/sulfamethoxazole (Bactrim). Which common side effects should the nurse anticipate? **Select all that apply.**

1. Jaundice
2. Vomiting
3. Headache
4. Toxic nephrosis
5. Hypersensitivity reactions

264. A 10-year-old child is diagnosed with lymphocytic thyroiditis (Hashimoto disease). What should the nurse explain to the parents and child about this condition?

1. It is chronic.
2. Treatment is difficult.
3. It is an inherited disorder.

4. Regression occurs spontaneously.

265. A 7-year-old child is expressing fear concerning an uncomfortable sterile dressing change. What should the nurse say to be **most** therapeutic?

1. "Do you want some medicine so it won't hurt?"
2. "Will you help hold the package of bandages for me?"
3. "This won't hurt if you try to relax while closing your eyes."
4. "I'll put on television so you can watch it while I change the bandage."

► 266. A 6-year-old child is waiting with a family member in the pediatric clinic for a well-child visit. What are the **most** appropriate play activities for the office nurse to offer the child? **Select all that apply.**

1. Coloring book
2. Small metal cars
3. Simple card game
4. Large jigsaw puzzle
5. Children's magazines

267. What toy should a nurse offer two 6-year-old children in the playroom?

1. Clay
2. Checkers
3. Board game
4. Building set

268. A peripheral central venous catheter has just been inserted in the arm of a 7-year-old child on the pediatric unit. A peripheral IV line is still in place. An antibiotic is to be administered immediately. Which intravenous access line should the nurse use for the antibiotic infusion and why?

1. Central venous catheter, because this will help determine its patency
2. Peripheral line, because the central venous catheter is reserved for fluids
3. Central venous catheter, because the antibiotic must be given systemically as quickly as possible
4. Peripheral line, because the central venous catheter placement has not been confirmed by radiograph

► 269. A 9-year-old child who is receiving IV antibiotic therapy becomes bored and irritable. What activities for school-age children should the nurse suggest? **Select all that apply.**

1. Playing solitaire
2. Starting a collection
3. Making a model airplane
4. Doing arithmetic puzzles
5. Watching game shows on television

270. Which fifth-grader who needs help with social interaction should the school nurse appoint as a health office monitor?

1. One who is reserved, although strong academically
2. The child who has been identified as the class clown
3. One who comes to the health office daily for medication

4. The child who participates in a wide variety of school-related activities
271. What nursing intervention will be **most** effective to help relieve the anxiety of a young school-age child during the postoperative period?
1. Encouraging the child to talk about feelings
  2. Having the child and a parent room together
  3. Telling the child a story about a child with similar surgery
  4. Providing the child with sterile dressing equipment and a doll
272. The school nurse is planning to teach a class about nutrition. Which age group will be **most** receptive to this information?
1. 6-year-old children
  2. 8-year-old children
  3. 11-year-old children
  4. 15-year-old children
273. Obesity in children is an ever-increasing problem. What should a nurse consider before confronting the problem with individual children?
1. Enjoyment of specific foods is inherited.
  2. Childhood obesity is not usually a predictor of adult obesity.
  3. Children with obese parents and siblings are destined for obesity.
  4. Familial and cultural influences are deciding factors in eating habits.
274. An 11-year-old child has gained weight. The mother tells a nurse that she is concerned that her child, who loves sports, may become obese. What is the nurse's **most** appropriate response?
1. Suggest an increase in activity.
  2. Encourage a decreased caloric intake.
  3. Explain this is expected during preadolescence.
  4. Discuss the influence of genetics on weight gain.
275. A 7-year-old child is admitted for surgery. What is an **essential** preoperative nursing intervention?
1. Allow a favorite toy to remain with the child.
  2. Document the child's ASO titer and C-reactive protein level.
  3. Inspect the child's mouth for loose teeth and report the findings.
  4. Encourage a parent to stay until the child leaves for the operating room.
276. A 7-year-old child develops a urinary tract infection. A sulfonamide preparation is prescribed. What is a **major** nursing responsibility when administering this drug?
1. Weigh the child daily.
  2. Give the medication with milk.
  3. Monitor the child's temperature frequently.
  4. Administer the drug at the prescribed times.
- 277. A child is admitted with a diagnosis of acute post streptococcal glomerulonephritis (APSGN). When performing a physical assessment and reviewing the child's laboratory reports, what clinical findings does the nurse expect? **Select all that apply.**
1. Hematuria
  2. Proteinuria

3. Periorbital edema
4. Increased specific gravity
5. Slight increase in blood pressure

278. When planning nursing care for a 5-year-old child with acute post streptococcal glomerulonephritis (APSGN), what should the nurse emphasize that the child and family maintain?

1. A bland diet high in protein
2. Bed rest for at least four weeks
3. Isolation from children with infections
4. A daily intramuscular dose of penicillin

279. The parents of a child with acute post streptococcal glomerulonephritis (APSGN) tell the nurse that they are concerned about activity restrictions after discharge. How should the nurse respond?

1. Activity must be limited for 1 month.
2. The child should not play active games.
3. The child must remain in bed for 2 weeks.
4. Activity does not affect the course of the illness.

280. The nurse is providing instruction to a parent of a child with influenza. Which statement by the parent indicates the need for further instruction?

1. "I will manage the fever with baby aspirin."
2. "We will make sure to get a flu shot next season."
3. "Providing fluids will help relieve the symptoms."
4. "Staying home from school will prevent transmission."

281. The parents of a child with acute post streptococcal glomerulonephritis (APSGN) ask a nurse why their child is being weighed every morning. What is the nurse's **best** response?

1. "It is the best way to measure your child's fluid balance."
2. "It provides a measure of how much protein is being lost."
3. "The disease process usually is over when weight loss stops."
4. "Plans for the daily caloric intake are made according to the daily weight change."

► 282. A 7-year-old child is admitted for a diagnostic workup and is transferred from the emergency department to the pediatric unit. The nurse reviews the admission note and physical assessment. The nurse obtains the child's vital signs and talks with the parents. The parents ask the nurse why their child has severe headaches. What explanation should the nurse give for the cause of the headaches?

## History and Physical

7-year-old child

Reporting general malaise

Experiencing severe headaches

Hematuria

## Admission Note

Tentative diagnosis: acute post streptococcal glomerulonephritis (APSGN)

## Vital Signs

Temperature: 98.2° F

Pulse: 96 beats/min

Respirations: 26 breaths/min

Blood Pressure: 150/90 mmHg

1. Rapid respirations
2. Elevated blood pressure
3. Anemia associated with the hematuria
4. Autoimmune response associated with APSGN

283. A 7-year-old child has recently been diagnosed with juvenile idiopathic arthritis (JIA). The parents are concerned about the lifelong effects of the disorder and are investigating other therapies to use with the medications. What referral should the nurse recommend?

1. Physical therapy
2. Special education
3. Nutritional therapy
4. Herbal supplements

284. An 11-year-old child with juvenile idiopathic arthritis (JIA) will be receiving continued nonsteroidal antiinflammatory drug (NSAID) therapy at home. Which important toxic effect of NSAIDs must be included in the nurse's discharge instructions to the child and family?

1. Diarrhea
2. Hypothermia
3. Blood in the urine
4. Increased irritability

► 285. A nurse is teaching the parents of a child with juvenile idiopathic arthritis (JIA) how to prevent loss of joint function. Which activities should be encouraged? **Select all that apply.**

1. Riding a bicycle
2. Walking to school

3. Watching videos after school
4. Swimming in the community pool
5. Playing computer games after school

286. Range-of-motion exercises are prescribed for a child with juvenile idiopathic arthritis (JIA). What criterion should the nurse use to evaluate the effectiveness of the exercises?

1. Pain is relieved.
2. Affected joints can flex and extend.
3. Pedal and radial pulses are diminished.
4. Subcutaneous nodules at the joints recede.

287. The parents of a 12-year-old child with juvenile idiopathic arthritis (JIA) ask a nurse why their child is not receiving steroid therapy because it is so effective for adults with rheumatoid arthritis. The nurse responds that it is not used as the first-choice drug for a preadolescent. On what aspect of the child's development should the nurse explain it will have an adverse effect?

1. Growth
2. Sexuality
3. Emotions
4. Body image

288. A nurse is planning to teach about self-administration of insulin to a school-age child newly diagnosed with diabetes mellitus. What is the nurse's **first** action?

1. Assess the child's developmental level.
2. Determine the family's understanding of the procedure.
3. Discuss community resources for the child in the future.
4. Collaborate with the school nurse for ensuring continuity of care in school.

289. A nurse is planning a teaching program for a child who has recently been diagnosed with type 1 diabetes. What is the nurse's **first** concern relating to the child and parents?

1. Exploring their feelings about diabetes
2. Needing to restrict the child's activities
3. Learning to monitor blood glucose levels
4. Practicing administering insulin injections

290. A nurse is teaching a 12-year-old child with type 1 diabetes about the effects of Novolin N insulin. If the child receives the insulin at 7:30 AM, what time of day is an insulin reaction likely to occur?

1. 8:30 PM
2. 2:30 PM
3. 9:30 AM
4. 1:30 AM

291. A nurse is planning an evening snack for a child receiving Novolin N insulin. What is the reason for this nursing action?

1. It encourages the child to stay on the diet.
2. Energy is needed for immediate utilization.
3. Extra calories will help the child gain weight.
4. Nourishment helps to counteract late insulin activity.

292. A nurse is developing a teaching plan for an 8-year-old child who has recently been diagnosed with type 1 diabetes. What developmental characteristic of a child this age should the nurse consider?
1. Child is in the abstract level of cognition.
  2. Child's dependence on peer influence has reached its peak.
  3. Child will welcome opportunities for participation in self-care.
  4. Child's developmental stage involves achieving a sense of identity.
293. When teaching an adolescent with type 1 diabetes about dietary management, what should the nurse include?
1. Meals should be eaten at home.
  2. Foods should be weighed on a gram scale.
  3. Ready source of glucose should be available.
  4. Specific foods should be cooked for the adolescent.
294. At 7 AM, a nurse receives the information that an adolescent with diabetes has a 6:30 AM fasting blood glucose level of 180 mg/dL. What is the **priority** nursing action at this time?
1. Encourage the adolescent to start exercising.
  2. Ask the adolescent to obtain an immediate glucometer reading.
  3. Inform the adolescent that a complex carbohydrate such as cheese should be eaten.
  4. Tell the adolescent that the prescribed dose of rapid acting insulin should be administered.
295. What treatment should the nurse suggest to an adolescent with type 1 diabetes if an insulin reaction is experienced while at a basketball game?
1. "Call your parents immediately."
  2. "Buy a soda and hamburger to eat."
  3. "Administer insulin as soon as possible."
  4. "Leave the arena and rest until the symptoms subside."
296. One principle to be followed for children with type 1 diabetes is to provide for the variability of the child's activity. What should the nurse teach the child about how to compensate for increased physical activity?
1. Eat more food when planning to exercise more than usual.
  2. Take oral, not injectable insulin, on days of heavy exercise.
  3. Take insulin in the morning when extra exercise is anticipated.
  4. Eat foods that contain sugar to compensate for the extra exercise.
297. A parent receives a note from school that a student in class has head lice. The parent calls the school nurse to ask how to check for head lice. What instructions should the nurse provide?
1. "Ask the child where it itches."
  2. "Check to see if your dog has ear mites."
  3. "Look along the scalp line for white dots."
  4. "Observe between the fingers for red lines."
298. A 6-year-old child comes to the school nurse reporting a sore throat, and the nurse verifies that the child has a fever and a red, inflamed throat. When a parent of the child

arrives at school to take the child home, the nurse urges the parent to seek treatment. The nurse is aware that the causative agent may be beta-hemolytic streptococcus, and the illness may progress to inflamed joints and an infection in the heart. What illness is of **most** concern to the nurse?

1. Tetanus
2. Influenza
3. Scarlet fever
4. Rheumatic fever

299. Based on developmental norms for a 5-year-old child, a nurse decides to withhold a scheduled dose of digoxin (Lanoxin) elixir and notify the health care provider. Below what apical pulse did the nurse withhold the medication?

1. 60 beats/min
2. 70 beats/min
3. 90 beats/min
4. 100 beats/min

300. A child has been diagnosed with classic hemophilia. A nurse teaches the child's parents how to administer the plasma component factor VIII through a venous port. It is to be given 3 times a week. What should the nurse tell them about when to administer this therapy?

1. Whenever a bleed is suspected
2. In the morning on scheduled days
3. At bedtime while the child is lying quietly in bed
4. On a regular schedule at the parents' convenience

301. What medication does a nurse expect to administer to control bleeding in a child with hemophilia A?

1. Albumin
2. Fresh frozen plasma
3. Factor VIII concentrate
4. Factors II, VII, IX, X complex

302. A nurse is explaining how hemophilia is inherited to the parents of a recently diagnosed child. What is the **best** explanation of the genetic factor that is involved?

1. It follows the Mendelian law of inherited disorders.
2. The mother is the carrier of the disorder, but is not affected by it.
3. It is an autosomal dominant disorder in which the woman carries the trait.
4. A carrier can be male or female, but it occurs in the sex opposite that of the carrier.

303. The parent of a child with hemophilia asks the nurse, "If my son hurts himself, is it all right if I give him two baby aspirins?" How should the nurse respond?

1. "You seem concerned about giving drugs to your child."
2. "It is all right to give him baby aspirin when he hurts himself."
3. "Aspirin may cause more bleeding. Give him acetaminophen instead."
4. "He should be given acetaminophen every day. It will prevent bleeding."

► 304. A 12-year-old child with Down syndrome is admitted to the hospital for intravenous antibiotics for pneumonia. Which clinical findings associated with Down

syndrome should the nurse expect when performing a physical assessment? **Select all that apply.**

1. Saddle nose
2. Thin fingers
3. Inner epicanthic folds
4. Hypertonic musculature
5. Transverse palmar crease

305. An 8-year-old child is diagnosed with Legg-Calvé-Perthe disease. The health care provider orders an abduction brace 23 hours a day and non-weight-bearing activity. What should the nurse teach the parents to do?

1. Have the child transfer to a wheelchair using the unaffected leg.
2. Explain that kneeling, but not standing, on the affected leg is permitted.
3. Perform range-of-motion exercises to the lower extremities twice a day.
4. Crutches can be used as long as the four-point gait is used when walking.

# Nursing Care of Adolescents

► 306. An adolescent is admitted to the hospital in respiratory distress, and the health care provider orders oxygen at 40% via a Venturi mask. The instructions for the Venturi mask indicate 4 L/min: 24% to 28%; 8 L/min: 35% to 40%; and 12 L/min: 50% to 60%. Draw a circle where the ball of the flow meter should be raised to deliver the percent of oxygen ordered by the health care provider.

307. After orthopedic surgery, a 15-year-old adolescent reports a pain rating of 5 on a scale of 0 to 10. A nurse administers the prescribed 5 mg of oxycodone every 3 hours prn. Two hours after having been given this medication, the adolescent reports a pain rating of 10 out of 10. What action should the nurse take?

1. Administer another dose of oxycodone within 30 minutes.
2. Report that the adolescent has an apparent idiosyncrasy to oxycodone.
3. Tell the adolescent that additional medication cannot be given for 1 more hour.
4. Request that the health care provider evaluate the need for additional medication.

► 308. An adolescent is hospitalized for dehydration. An IV of 1000 mL of 0.9% sodium chloride with 20 mEq/L of potassium chloride is prescribed. A 500 mL bag of 0.9% sodium chloride is available. The potassium chloride label reads 2 mEq/mL. How many milliliters of potassium chloride should the nurse add to the 500 mL bag? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ mL

309. A 15-year-old adolescent who has type 1 diabetes arrives at the diabetic outpatient

clinic with a parent. The adolescent sits back in the chair with arms folded, frowns, and displays an “I don’t care” attitude. The adolescent and parent argue in front of the nurse. What is the **best** approach for the nurse to use?

1. Encourage the adolescent to take more interest in and responsibility for treatment.
2. Speak separately with each of them, encouraging them to recognize and vent their anger.
3. Try to persuade the two of them to work out their differences together before returning to the clinic.
4. Ask the parent to stay in the waiting room while the adolescent meets with the clinic’s staff members.

310. A nurse is teaching growth and development to a group of parents. When discussing puberty, one parent asks at what age a girl will get her first period. How should the nurse respond?

1. Before the pubic hair appears
2. About the same time the breasts develop
3. At the end of the prepubertal growth spurt
4. Near the age the mother had her first period

► 311. A 13-year-old female adolescent comes to the pediatric clinic, and her body mass index (BMI) is 21. Compare the adolescent’s BMI to the body mass index-for-age percentiles for girls, 2 to 20 years, graph and determine what percentile this adolescent falls under. **Record your answer using a whole number.**

Answer: \_\_\_\_\_%

312. A nurse is interviewing an adolescent who is to start on a chemotherapeutic drug regimen that includes vinCRISTine. For which side effect is it **most** important for the nurse to prepare the adolescent?

1. Alopecia
2. Constipation
3. Loss of appetite
4. Peripheral neuropathy

313. How can a nurse **best** accomplish therapeutic communication with an adolescent?

1. Using teen language
2. Relating on a peer level
3. Establishing a relationship over time
4. Interacting by using concrete concepts

314. A nurse is planning to discuss the importance of following the prescribed course of treatment with a group of adolescent clients. What should the nurse **first** consider about their approach to illness and treatment?

1. They are in touch with their feelings and concerns.
2. Their thinking is both concrete and reality oriented.
3. They are involved more with the present than the future.
4. Their developmental goal is striving for industry versus inferiority.

315. A nurse is teaching a group of parents about a developmental expectation that occurs in girls at about 10 years of age. What should the nurse explain about one of the earliest signs of sexual maturity?

1. Interest in the opposite sex
2. Paying attention to grooming
3. The first menstrual period or menarche
4. The appearance of axillary and pubic hair

316. An adolescent sustains a sports-related fracture of the femur, and an open reduction and internal fixation with a rod insertion is performed. After the surgery, a nurse identifies that the adolescent is very upset. Considering the developmental level, what does the nurse conclude is the **most** likely explanation for this distress?

1. The need to navigate in a wheelchair
2. The perception that the rod is a body intrusion
3. Inability to participate in sports for several years
4. Relief of pain will necessitate medication until the bone heals

317. A 13-year-old adolescent is diagnosed as having idiopathic scoliosis. Because exercise and avoidance of fatigue are essential components of care, which sport should the nurse suggest will be **most** therapeutic for this preadolescent?

1. Golf
2. Bowling
3. Swimming
4. Badminton

318. To slow the progression of the curvature, the preadolescent with scoliosis is fitted with a brace. How should the nurse respond to the parents' questions about when the brace will no longer be needed?

1. After cessation of bone growth
2. After the curvature has straightened
3. When the iliac crests are at equal levels
4. When pain-free after prolonged standing

▶ 319. An adolescent who is receiving chemotherapy for the treatment of bone cancer has stomatitis as a result of chemotherapy. What should the nurse include when teaching the child about self-care? **Select all that apply.**

1. Clean the teeth with a swab.
2. Drink fluids through a straw.
3. Brush the teeth three times a day.
4. Rinse frequently with a mouthwash.
5. Avoid food that has extremes in temperature.

320. A nurse on the adolescent unit is planning to discuss smoking prevention. What is the **most** effective approach for the nurse to use?

1. Share personal experiences with a smoking cessation program.
2. Show pictures of the effects of smoking on the cardiopulmonary system.
3. Present information on how smoking affects appearance and odor of the breath.
4. Cite statistics about the relationship between smoking and cardiopulmonary diseases.

321. An adolescent with a serious health problem refuses to wear a medical alert bracelet. How can a nurse foster wearing of the bracelet?

1. Recommend hiding the bracelet under long-sleeved clothes.
2. Suggest wearing the bracelet when engaging in contact sports.
3. Encourage the teenager to ask friends to wear similar bracelets.
4. Help the teenager select a bracelet that is similar to those worn by peers.

322. A 13-year-old boy tells the school nurse that he is getting breasts. How should the nurse respond?

1. "This is expected at your age; let's talk about it."
2. "You should get a physical; I'll talk with your parents about this."
3. "There is nothing to worry about; this happens to a lot of boys your age."
4. "Wear a tight undershirt inside a button-down shirt; that should hide them."

323. An adolescent arrives at the clinic reporting experiencing buzzing in the ears. What assessment data are **essential** for the nurse to obtain?

1. Music preferences
2. Childhood ear infections
3. Recent emotional trauma
4. Familial history of deafness

324. An adolescent with terminal cancer tells the home care nurse, "I would really like to get my high school equivalency diploma. Do you think this is possible?" What is the nurse's **best** approach in response to the adolescent's question?

1. Refocus the conversation on things the adolescent has already accomplished in life.

2. Try to help the adolescent understand that this wish is too taxing and slightly unrealistic.
  3. Arrange for a conference with the school and encourage the adolescent to prepare for the test.
  4. Suggest to the adolescent that this energy should be directed toward expressing feelings about the illness.
- 325. A 17-year-old adolescent with a history of asthma is brought to the emergency department in respiratory distress. A nurse immediately places the client in a bed with the head of the bed elevated and administers oxygen via a facemask. The health care provider performs a physical assessment, writes orders, and admits the adolescent to the pediatric unit. What is the nurse's **priority** intervention?

### **Physical Assessment**

Dyspnea; flaring of nares; productive cough; sputum is frothy, clear, and gelatinous; wheezing. Adolescent indicates shortness of breath, chest discomfort, headache, and feeling tired

### **Health Care Provider's Orders**

Bed rest

Complete blood count

SMA 12

Albuterol (Proventil) 2.5 mg via nebulizer, one dose

Chest physiotherapy bid

Incentive spirometer

Oxygen via mask at 8 liters

Referral to allergist

### **Vital Signs**

Temperature: 98.8° F

Pulse: 108 beats/min

Respirations: 30 breaths/min

Blood Pressure: 130/86

1. Administering the nebulizer treatment to facilitate breathing
2. Obtaining a blood specimen to send to the laboratory for tests
3. Notifying the respiratory therapist to perform chest physiotherapy
4. Sending a requisition to central supply for an incentive spirometer

## **Answers and Rationales**

# Nursing Care of Infants

1. Answer: 4.5 mL. To determine the dose, multiply  $15 \text{ mg} \times 9.6 \text{ kg} = 144 \text{ mg}$ . Use the "Desired over Have" formula of ratio and proportion to solve this problem.

$$\frac{\text{Desired}}{\text{Have}} \frac{144 \text{ mg}}{160 \text{ mg}} = \frac{x \text{ mL}}{5 \text{ mL}}$$

$$160 x = 720$$

$$x = 720 \div 160$$

$$x = 4.5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Basics of Nursing Practice, Medication Administration, Nursing Responsibilities Related to Medication Administration

2. **4 Based on the family's decision, extraordinary care does not have to be employed; the infant's basic needs are met, and nature is allowed to take its course.**

1 If the infant's physical needs are met and comfort is provided, the infant's rights are not ignored; "extraordinary," not "all," care is being withheld. 2 Euthanasia is a deliberate intervention to cause death. 3 It is not illegal to withhold extraordinary treatment; once such treatment is started, it may become a legal issue.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 29, Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs

3. **3 The family members are more inclined to share problems with the nurse if they are not feeling pressured; in addition, it aids in the development of a productive relationship.**

1 The father should be included in the visit if at all possible. 2 This may be an inconvenient time for the mother and interfere with productivity. 4 This may be at a time that is inconvenient for the family and thus interfere with productive interaction.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs

4. **2 A pacifier should be given during the feeding to help the infant associate sucking with feeding and to meet oral needs.**

- 1 This will cause complications if the tube is not in the stomach. 3 This should be done after placement of the tube and verification of a residual return. 4 Upright positioning is essential to prevent regurgitation or reflux and subsequent aspiration.  
**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hospitalization of Infants, General Nursing Care of Infants
5. 1 **This helps and encourages parents to put their fears and feelings into words. Once these sentiments are expressed, they can then be examined and addressed.**  
2 This will not assist the parents in coping with the problem, nor will it demonstrate the supportive, empathetic role of the nurse. 3 This response lacks insight. Parents will worry about their infant anyway. 4 This may or may not be helpful.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs
6. 3 **When taking a health history, all areas of concern should be explored fully before deciding how to address the problem.**  
1 The nurse should gather more data to determine the basis for the problem. 2 More data are needed before recommendations can be made. 4 The data are inadequate to focus on nutrition.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Age Related Responses to Pain, Infant
7. 3 **A respiratory rate of less than 30 breaths/min in a young infant is not within the expected range of 30 to 60 breaths/min; a drop to less than 30 breaths/min is a significant change and should be documented.**  
1 Respirations will accelerate when there is discomfort. 2 Any significant change should be reported immediately. 4 The respiratory tract is fully developed at birth, and the respiratory rate is a cardinal sign of the infant's well-being.  
**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 29, Characteristics of Growth, Respiratory System
8. **Answer: 1, 2, 3.**  
1 This may limit the occurrence of intestinal cramping. 2 This reduces the amount of air entering the intestine, which may limit the occurrence of intestinal cramping. 3 Providing warmth through a hot-water bottle or heating pad over the abdomen may be helpful for some infants because it helps to relax the abdominal muscles and limit intestinal cramping. 4 Although many people try this remedy, it rarely works. 5 A quiet environment may help prevent, not treat, the problem.  
**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Caring; Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Colic, Nursing Care
9. **Answer: 30 inches. This infant is 2 inches shorter than expected. At 1 year of age an infant should have increased the birth length by 50%; 50% of 20 inches is 10 inches; 10**

**inches added to the birth length of 20 inches equals 30 inches.**

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Growth and Development, Ten to Twelve Months

**10. 1 Sucking meets oral needs, which are primary during infancy.**

**2** An infant a few days old is too young to focus well on a mobile; in addition, the newborn will be placed in a side-lying position postoperatively and thus would not be able to see the mobile. **3** A 2-day-old infant is not developmentally capable of enjoying a soft, cuddly toy. **4** This is not a developmental need.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hospitalization of Infants, General Nursing Care of Infants

**11. Answer: 2, 4.**

**1** Infants who have failure to thrive usually are quiet and lethargic. **2** These children usually have developmental delays, including language, motor, social, and adaptive deficits. **3** Their weight usually is below the fifth percentile. **4** Infants who have failure to thrive usually are frail and are at risk for physical and emotional illnesses. **5** Responsiveness to stimuli is limited or nonexistent.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Failure to Thrive, Data Base

**12. 4 Excessively high temperatures can damage the delicate skin of an infant.**

**1** Although infants are capable of putting small things in their mouths, they are not yet able to crawl and probably will not be placed on the floor. **2** At 3 months of age infants are not yet able to explore the environment to the point that electric outlets pose a problem. **3** At 3 months of age infants are still too small and have not yet developed motor capabilities to get into containers of poison.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Injury Prevention during Infancy

**13. 2 Muscular coordination and perception are developed enough at 6 months for the infant to roll over. If unaware of this ability, the parent may leave the infant unattended for a moment to reach for something, and the infant could roll off an elevated surface.**

**1** Sitting up unsupported is accomplished by most infants at 7 to 8 months. **3** Crawling takes place at about 9 months of age. **4** Standing by holding on to furniture is accomplished by most infants between 8 and 10 months of age.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Injury Prevention during Infancy

**14. 4 The 7-month-old infant is accustomed to having the perineal area exposed and cared for and is not in a developmental stage where fears related to sexuality are present.**

**1** A "clean catch" at this age is often contaminated; a catheterization has been ordered. **2** The parents do have the right to refuse, but this concern is not realistic for

this age infant. **3** The parent's concern is not appropriate for the developmental age of the infant.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Hospitalization of Infants, Data Base

**15. 1 The bottom incisors are the first teeth to erupt at about 6 to 8 months of age.**

**2** The canine teeth appear at about 18 months. **3, 4** The first molars, both upper and lower, appear at about 20 months.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Growth and Development, Six to Seven Months

**16. 1 This position offers the lowest risk for sudden infant death syndrome (SIDS).**

**2, 3, 4** The American Academy of Pediatrics does not recommend the lateral position because the infant can fall forward into the prone position.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Sudden Infant Death Syndrome, Data Base

**17. 2 A common sign of shaken baby syndrome (SBS) is apnea without stridor or adventitious sounds, resulting from CNS trauma.**

**1** The age of the infant is beyond the time that respiratory distress caused by immaturity would occur. **3** Short periods of apnea of less than 15 seconds are expected at any age. **4** These findings are indicative of laryngotracheobronchitis, which is common in children younger than 5 years of age, but would not be expected at 3 months.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Shaken Baby Syndrome, Data Base

**18. 1 Grunting and rapid respirations are signs of respiratory distress in an infant.**

**Grunting is a compensatory mechanism whereby the infant attempts to keep air in the alveoli to increase arterial oxygenation; increased respirations increase oxygen and carbon dioxide exchange.**

**2** Sweating in infants usually is scant because of immature functioning of the exocrine glands; profuse sweating rarely is seen in a sick infant. **3** This is not necessarily a sign of illness. **4** This is not necessarily indicative of illness.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Respiratory Tract Infections, Data Base

**19. 2 Choanal atresia is a lack of an opening between one or both of the nasal passages and the nasopharynx.**

**1** Rectal atresia involves the rectum ending in a pouch and the anal canal opening into the other (nonconnected) end of the rectum. **3** Atresias associated with the gastrointestinal tract include esophageal and intestinal atresia involving the ileum, jejunum, or colon. **4** An atresia involving the pharynx and larynx is not commonly seen.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Nasopharyngeal and Tracheoesophageal

**20. 1 There is little or no opening between the nasal passages and the nasopharynx; therefore, the infant can breathe only through the mouth. When feeding, the infant cannot breathe without aspirating some of the fluid; this causes choking.**

**2** The swallowing reflex is present in these infants. **3** Because it is difficult if not impossible to suck, the infant will be hungry. **4** If choanal atresia is unilateral, there may be no symptoms, and the infant will be able to feed; if bilateral, sucking will be almost impossible.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Nasopharyngeal and Tracheoesophageal Anomalies, Data Base

**21. Answer: 4, 1, 5, 2, 3.**

**4** A patent airway and adequate pulmonary ventilation are always the priorities; inadequate oxygenation can result in cerebral anoxia. **1** Vital signs, including heart rate, are called vital because they reflect the cardiopulmonary and hemodynamic status of a person. **5** Replenishment of body fluids is a significant intervention after surgery; the patency of the catheter must be maintained and the flow rate monitored to ensure that an excessive amount is not instilled and affect the delicate fluid balance in an infant. **2** The operative site should be monitored for signs of hemorrhage but after the vital signs. An increase in the heart and respiratory rates and a decrease in blood pressure may indicate bleeding. **3** The urinary output should be monitored hourly. This comes after airway, breathing, and circulation, signs of bleeding, and interventions that can influence these vital signs are monitored.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Cardiac Malformations, General Nursing Care of Children with Cardiac Malformations

**22. 3 The priority is a patent airway; necessary equipment must be immediately available.**

**1** Although this is helpful, it is not the priority. **2** This is unnecessary; it may be done if the child has a high fever or a history of febrile seizures. **4** Although appropriate, this is not the priority.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

**23. 4 Laryngeal spasms can occur abruptly; patency of the airway is determined by constant assessment for signs of respiratory distress.**

**1, 2, 3** This is important, but is not the priority.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

**24. 2 Often the infant will have decreased pulmonary reserve, and the clustering of care is essential to provide for periods of rest.**

**1** Antiviral therapy is controversial for this age group and is not given unless there are

complications. **3** IV fluids are given during the acute phase to prevent dehydration. **4** Antitussive agents are not used; nasal secretions are aspirated with a bulb syringe whenever necessary.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

**25. Answer: 1.5 mL.** Use the “Desired over Have” formula of ratio and proportion to solve this problem.

$$\frac{\text{Desire}}{\text{Have}} \frac{375 \text{ mL}}{250 \text{ mL}} = \frac{x \text{ mL}}{1 \text{ mL}}$$

$$250 x = 375$$

$$x = 375 \div 250$$

$$x = 1.5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 2, Basics of Nursing Care, Medication Administration, Nursing Responsibilities Related to Medication Administration

**26. 1 Rest reduces the need for oxygen and minimizes metabolic needs during the acute, febrile stage of the disease.**

**2** The child requiring hospitalization for pneumonia usually is confined to bed and needs to reduce activity to conserve oxygen. **3** This is not a priority; the child is expected to be anorectic during the febrile phase. **4** Elimination usually is not a problem, except as a result of immobility.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

**27. 3 Respiratory syncytial virus (RSV) is highly contagious. The infant should be isolated or placed with other infants with RSV. Standard and contact precautions are instituted to limit the spread of pathogens to others.**

**1** The infant should receive cool, humidified oxygen either by nasal cannula, by mask, or in a croup tent. **2** Because RSV is extremely contagious, the number of visitors should be limited. Uninfected children should not be allowed near the infant, and as few personnel as possible should care for the infant. **4** Antibiotics are not effective and their use is contraindicated.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

**28. 3 The bladder membrane is exposed; it must remain moist and, as far as possible, sterile.**

**1, 2** This will allow the exposed membrane to dry and increase the risk for infection. **4** The jelly will adhere to the membrane, causing trauma.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Exstrophy of the Bladder, Nursing Care

**29. 4 The pubic bone and the bladder form during the same time of embryonic development.**

**1, 2, 3** This defect is not associated with exstrophy of the bladder.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Exstrophy of the Bladder, Data Base

**30. 1 The greatest problem facing this infant is infection of the bladder mucosa and excoriation of the surrounding tissue; meticulous hygiene is necessary both preoperatively and postoperatively.**

**2** Dehydration is not a problem because fluid intake and the amount of urinary output are not affected. **3** Urinary retention is not a problem because the urine drains continuously. **4** The congenital abnormality involves the genitourinary system, not the intestines.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Exstrophy of the Bladder, Nursing Care

**31. 1 This provides for collection of more data.**

**2** This implies that things are not well and that the mother may be to blame. **3** This may make the mother feel guilty about not meeting her baby's needs. **4** This is a negative comment that closes communication.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Exstrophy of the Bladder, Nursing Care

**32. 1 Mumps can cause orchitis (inflammation of the testes) in males and oophoritis (inflammation of the ovaries) in females. Although rare, both can render the postpubescent child sterile.**

**2, 3, 4** This is not associated with mumps.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Immunizations

**33. 3 Cardiac anomalies often accompany genetic problems such as Down syndrome; 30% to 40% of these infants have congenital heart defects.**

**1** These infants do not have increased intracranial pressure; the fontanelles should be flat. **2** The extremities will more likely be relaxed. **4** They have the usual pupillary

reactions to light.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Trisomy 21, Data Base

**34. 4 Touching the palms of the hands causes flexion of the fingers (grasp reflex); this usually lessens after 3 months of age. An unexpected loud noise causes abduction of the extremities and then flexion of the elbows (startle reflex); this usually disappears by 4 months of age. Persistence of primitive reflexes usually is indicative of a developmental delay.**

**1** It is not necessary to gather more data because these changes are consistent with expected growth and development. **2** The data do not support making this comment; this may cause needless concern. **3** Sensory stimulation at this age is directed toward experiences to add new motor, language, and social skills.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Growth and Development, Two to Three Months

**35. 4 The Hib vaccine may cause a low-grade fever.**

**1** Lethargy is not expected. **2** Urticaria is more likely to occur with the tetanus and pertussis vaccines. **3** There may be a mild reaction at the injection site, but a generalized rash is not expected.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Immunizations

**36. Answer: 50 mL. The correct rate is 50 mL/hr. Divide the total volume to be infused (400 mL) by the number of hours it is to be infused (8):  $400 \div 8 = 50$  mL.**

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 3, Fluid, Electrolyte, and Acid-Base Balance, General Nursing Care of Clients with Fluid and Electrolyte Problems

**37. 4 The extracellular body fluid represents 45% at birth, 25% at 2 years of age, and 20% at maturity. Another measurement is fluid's percentage of total body weight, which is 80% at birth, 63% at 3 years, and approximately 60% at 12 years.**

**1** Cellular metabolism in children is stable, but its rate is higher than that in adults. **2** The proportion of total body water in children (up to 2 years) is greater than it is in adults. **3** Renal function is immature through the second year of life, not until school age, which makes it more difficult to maintain fluid balance.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 29, Characteristics of Growth, Circulatory System

**38. 1 Febrile seizures usually are not associated with major neurologic problems. From 95% to 98% of these children do not develop epilepsy or other neurologic problems.**

**2** The cause of febrile seizures is still uncertain. **3** Most febrile seizures occur after 6 months of age and before age 3 years, with the average age of onset between 18 and 22 months. **4** Boys are affected about twice as frequently as girls.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 30, Febrile Seizures, Data Base

**39. 1 Shivering increases the metabolic rate, which intensifies the body's need for oxygen and increases the body temperature.**

**2** Restricting fluids is contraindicated because of the risk for dehydration; fluids should be offered. **3** Although monitoring output will provide information about the child's level of hydration, it is more important to take action to prevent increases in the fever. **4** Although monitoring vital signs is important, it is not the priority.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Febrile Seizures, Nursing Care

**40. 3 Because the child is in a crib, the nurse should remain, observe, and protect the child from injury to the head or extremities during seizure activity.**

**1** An individual should never be restrained during a seizure; fractured bones or torn muscles and ligaments can result. **2** This is useless until the seizure is over; the child is apneic during the seizure. **4** Attempts at inserting an airway are futile; this may damage the child's teeth and jaws.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Febrile Seizure, Nursing Care

**41. 2 This limits the danger of falling and striking the head.**

**1** This is unsafe; attempting to open the jaw may result in injury. **3** Protecting the child is the priority; assistance at this time is futile. **4** This may cause airway occlusion by forcing the chin onto the neck.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Febrile Seizure, Nursing Care

**42. Answer: 1, 2.**

**1** Irritability is a classic sign of increased intracranial pressure because of disruption of the central nervous system (CNS). **2** Bradycardia is a classic sign of increased intracranial pressure; it is a late sign. **3** With increased intracranial pressure, there is decreased alertness or loss of consciousness. **4** The pulse pressure increases with increased intracranial pressure. **5** The systolic blood pressure increases with increased intracranial pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

**43. 4 This is what occurs in communicating hydrocephalus.**

**1** This is often caused by a choroid plexus tumor and does not interfere with the flow of cerebrospinal fluid (CSF) through the ventricles. **2** This is an inaccurate answer; brain cells and the spinal cord are not involved. **3** This reflects the pathophysiologic process of noncommunicating hydrocephalus.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hydrocephalus, Data Base

**44. 2 The other children need to be involved with the grieving process and work through their own feelings.**

- 1** This is a long-term goal. **3** It is too early for this goal. **4** It is premature for this goal; also, they may never achieve this goal.  
**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Sudden Infant Death Syndrome, Nursing Care
- 45. 2 Elevation of the head helps decrease intracranial pressure by the use of gravity.**  
**1** This is done after the insertion of a shunt; if the infant is in the intensive care unit, this is done routinely. **3** This may be disturbing to the infant and impair the ability to rest. **4** Frequent stimulation may cause further irritability to an already traumatized central nervous system (CNS).  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hydrocephalus, Nursing Care
- 46. 2 Shunts are revised, and the length of the tubing is increased as the child grows.**  
**1** Although treatment of hydrocephalus by shunt replacement is quite successful, there is danger of malfunction and infection of the shunt. **3** Some brain damage may be reversible during the first year of life. **4** Hydrocephalus necessitates treatment for the life of the child.  
**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hydrocephalus, Nursing Care
- 47. 4 The shunt may obstruct and lead to an accumulation of cerebrospinal fluid (CSF) in the head; the accumulated fluid increases the intracranial pressure, which leads to brainstem hypoxia.**  
**1** Positioning the infant flat helps prevent complications resulting from too rapid reduction of intracranial fluid. **2** Although pain management is essential to minimize an increase in intracranial pressure, sedation is contraindicated because it will mask the infant's level of consciousness (LOC). **3** The infant is positioned on the opposite side from the shunt to prevent pressure on the valve and incisional area.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Hydrocephalus, Nursing Care
- 48. 3 The affected limbs should be exercised to promote circulation and prevent atrophy.**  
**1** Development should be encouraged; the infant's movements should not be restricted. **2** Fluids should be encouraged to provide adequate kidney function and prevent constipation. **4** The infant needs stimulation to develop mentally and socially.  
**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hydrocephalus, Nursing Care
- 49. Answer: 1, 3, 4.**  
**1** A low-grade fever progressing to a high fever occurs. **2** Irritability rather than lethargy results. **3** An infectious process that causes meningitis may result in rigidity and hyperextension of the neck (opisthotonos). **4** Central nervous system (CNS) irritation results in irritability and anorexia. **5** The fontanelles will be tense or bulging as increased intracranial pressure progresses.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

**50. 4 The anterior fontanel will be widened and tense because of the increased volume of cerebrospinal fluid (CSF).**

**1** The pulse rate will be decreased with increased intracranial pressure. **2** The reflexes will be hyperactive with increased intracranial pressure. **3** The blood pressure will be higher with increased intracranial pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Hydrocephalus, Nursing Care

**51. 1 These infants need follow-up care with a variety of health care providers (e.g., neurologist, physical therapist) to manage the child's condition during growth and development.**

**2** This is unnecessary. **3** Powder should be avoided; it will create a pastelike substance when mixed with urine and when aerosolized it is a respiratory irritant. **4** These children require more frequent perineal care than just routine cleansing and diaper changes.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Defects of Neural Tube Closure, Nursing Care

**52. 2 A meningocele is thinly covered and fragile; trauma to the sac can damage functioning neural tissue; an intact sac reduces a potential portal of entry for microorganisms.**

**1** Although extremely important, it is not the priority; care of the sac is even more important because an intact sac reduces a portal of entry for microorganisms. **3** Although observation for paralysis is an important nursing measure, it is not the priority. **4** The extent of a meningocele will influence the child's ability to control these functions, but control is not developed until the toddler and preschool years.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Defects of Neural Tube Closure, Nursing Care

**53. 2 This is the best position for preventing pressure on the sac.**

**1** Diapers should not be applied because they might irritate or contaminate the sac. **3** Assessment of the area below the defect is essential to determine motor and sensory function. **4** There is no indication for the use of an antiseptic.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Defects of Neural Tube Closure, Nursing Care

**54. 3 The surgical closure of the sac decreases the absorptive surface and eliminates a route by which the spinal fluid drains. Since the cranial sutures have not closed, the skull will expand if fluid increases, causing hydrocephalus.**

**1** The lower extremities of most infants with myelomeningocele are partially or completely paralyzed; performing careful range-of-motion exercise is an important

part of nursing care. **2** There is no reason to decrease environmental stimuli for infants who have had surgical correction of a myelomeningocele unless they also have seizures. **4** This is not expected, because damage to the meninges of the brain is not a factor in the surgical treatment of myelomeningocele.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Defects of Neural Tube Closure, Nursing Care

**55. 4 Infections of cranial structures can cause meningitis because bacteria travel by direct anatomic route to the meninges and cerebrospinal fluid (CSF).**

**1, 2, 3** This part of the body does not come into contact with CSF.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

**56. Answer: 1, 3, 2, 4, 5.**

**1** Bacterial meningitis is transmitted through respiratory droplets. The nurse should first ensure that all who come in contact with the child are appropriately gowned, gloved, and masked. **3** A circulatory access device provides an avenue to administer prescribed fluids and/or medications; also, it provides a circulatory access in case of an emergency. **2** The next priority is to obtain a sample of cerebral spinal fluid (CSF). This will help determine if the etiology is viral or bacterial, and the appropriate pharmacological therapy can be prescribed by the health care provider. **4** Once the CSF sample is obtained and the diagnosis is confirmed, the health care provider can prescribe the antibiotic that will most likely be appropriate for the causative microorganism. An antibiotic cannot be administered before it is prescribed. **5** Nuchal rigidity (neck stiffness) occurs as the disease progresses; it is not an initial sign of meningitis.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Meningitis, Nursing Care

**57. 4 Most children are no longer contagious after 24 to 48 hours of receiving IV antibiotics.**

**1** This time period is inadequate even if antibiotics are started immediately. **2, 3** This is an excessive time period and is unnecessary.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Meningitis, Nursing Care

**58. 2 The blood-brain barrier is affected, which permits the passage of protein into the cerebrospinal fluid (CSF).**

**1** The cell count will be increased. **3** Glucose levels are decreased in proportion to the duration of the disease. **4** Spinal fluid pressure will be increased.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

**59. 3 Meningococcal meningitis is identified by its epidemic nature and purpuric skin rash.**

**1, 4** This is not characteristic of meningococcal meningitis. **2** The fever of meningitis is usually high.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

60. **Answer: 1, 2, 5.**

1 Irritation of cerebral tissue can cause seizures. 2 Pressure on vital centers can cause vomiting. 3 A 2-year-old child's fontanelles are closed, so bulging fontanelles are not a sign of increased intracranial pressure. 4 The inflammatory process of meningitis causes an elevated temperature. 5 Pressure on the respiratory center results in a decreased respiratory rate.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

61. **3 Peripheral circulatory collapse (Waterhouse-Friderichsen syndrome) is a serious complication of meningococcal meningitis caused by bilateral adrenal hemorrhage. The resultant acute adrenocortical insufficiency causes profound shock, petechiae, ecchymotic lesions, vomiting, prostration, and hypotension.**

1 Although epilepsy may occur, it is controllable and not as serious as peripheral circulatory collapse. 2 Although blindness may occur, it is not as serious a complication as peripheral circulatory collapse. 4 Although hydrocephalus may occur, it is rare and not as serious as peripheral circulatory collapse.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Meningitis, Data Base

62. **4 Asymmetry of the gluteal dorsal surface of the thighs and inguinal folds indicates developmental dysplasia of the hip; folds on the affected side appear higher than those on the unaffected side.**

1 An inguinal hernia is evidenced by protrusion of the intestine into the inguinal sac. 2 Impaired reflex behavior and a shrill cry indicate central nervous system damage. 3 Peripheral nervous system damage is manifested by limpness or flaccidity of extremities.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Developmental Dysplasia of the Hip, Data Base

63. **4 A foul smell emanating from the cast indicates development of an infection and requires immediate treatment.**

1 Soiling of the cast with excreta, although problematic, is not a serious complication. 2 This is not necessary, nor is it desirable. 3 The infant's position should be changed frequently.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Developmental Dysplasia of the Hip, Nursing Care

64. **1 Standard seat belts and car seats are not readily adapted for use by children in spica casts; specially designed devices are available to meet safety requirements.**

2 Other strategies in addition to diapers will be necessary to keep the cast clean. 3 This is inadequate; the position should be changed at least every 2 hours. 4 Using the abduction bar for lifting or turning can weaken the cast; the bar is designed to keep the

hips in alignment.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Developmental Dysplasia of the Hip, Nursing Care

**65. 4 When elevation of the head is desired, the entire mattress or crib should be raised at the head of the crib.**

**1** There is no reason to place such a short time limit on this position. **2** Pillows under the head or shoulders of a child in a spica cast will thrust the chest forward against the cast, causing discomfort and respiratory distress. **3** This will not help elevate the infant's head.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Developmental Dysplasia of the Hip, Nursing Care

**66. 4 Congenital hypothyroidism is the result of insufficient secretion by the thyroid gland because of an embryonic defect. Decreased thyroid hormone affects the fetus before birth during cerebral development, so it is likely that there will be some cognitive impairments at birth. Treatment before 3 months will prevent further damage.**

**1** Congenital hypothyroidism does not become myxedema. **2** Thyrotoxicosis is another term for hyperthyroidism; it is not expected, but it can occur with an overdose of exogenous thyroid hormone; it is too soon to discuss this with the parents. **3** This occurs only if the infant has cerebral palsy.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Hypothyroidism, Data Base

**67. 2 Diaper dermatitis is caused by prolonged repetitive contact with an irritant (e.g., urine, feces, soaps, detergents, ointments, and friction).**

**1** Both cloth and disposable diapers can cause diaper dermatitis if not changed frequently. **3** An increased pH or alkaline urine can contribute to diaper dermatitis. **4** A change in diet may contribute, but there is no evidence that this is directly related.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Diarrhea, Data Base

**68. 1 Chalasias allows a reflux of gastric contents into the esophagus and eventual regurgitation. Placing the infant in an upright position keeps the gastric contents in the stomach by gravity and limits the pressure against the cardiac sphincter.**

**2** This probably will have little effect on chalasias. **3** This will promote regurgitation; it is an unsafe position because of the danger of SIDS. **4** This will promote vomiting; the infant should be allowed to stop feeding when satiated, not when the bottle is empty.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Nasopharyngeal and Tracheoesophageal Anomalies, Nursing Care

**69. 4 Offering a new food after giving some formula associates this activity with eating and takes advantage of the infant's unsatisfied hunger.**

**1** Solid food should be introduced by spoon to acquaint the infant with new tastes and

textures, as well as the use of the spoon. **2** Offering food after the regular feeding decreases the chance of success because the infant's hunger is already satisfied. **3** New foods should be initiated one at a time and continued for 4 to 5 days to assess for an allergic reaction.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Nutrition during Infancy, Guidelines for Infant Nutrition

**70. 1 Crying should be prevented because it places tension on the suture line. A metal appliance or adhesive strips are secured to the cheeks to keep the operative site relaxed, which helps prevent trauma.**

**2** The infant may be positioned on the side and on the back with surveillance. **3** This is not necessary or desirable. **4** The feeding method of choice is by a rubber-tipped syringe or dropper.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 30, Cleft Lip and Cleft Palate,

Nursing Care

**71. 4 Infants with a cleft lip breathe through their mouths, bypassing the natural humidification provided by the nose. As a result, the mucous membranes become dry and cracked and are easily infected.**

**1** The area can be kept clean by washing with water after each feeding. **2** Circulation in the area is unimpaired. **3** Feeding can be adequate with special equipment and a patient approach.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 30, Cleft Lip and Cleft Palate, Data Base

**72. 4 Because the infant with a cleft lip and palate is unable to form the vacuum needed for sucking, a rubber-tipped syringe or dropper is used. This allows formula to flow along the sides to the back of the mouth, minimizing the danger of aspiration.**

**1** A spoon is ineffective because the infant's extrusion reflex will prevent fluid from entering the mouth. **2** A cross-cut nipple may be used with some infants, but a rapid flow is dangerous because it can cause aspiration. **3** Feeding can be accomplished with special equipment; IV fluids are not necessary.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 30, Cleft Lip and Cleft Palate, Data Base

**73. 4 A child with a cleft palate has distinctive speech because the airflow required for speech cannot be controlled; although speech therapy usually is needed after surgery, surgery is scheduled before the child starts to speak because correct speech is easier to achieve.**

**1** This is not the reason the surgery is done at this age. **2** Children with a cleft palate require orthodontic and prosthodontic treatment for many years because of the malformed palate and the malposition of the teeth; the eruption of the teeth may be considered relative to the timing of surgery throughout childhood, but the 2-year molars are of little importance when considering the overall problem. **3** Although this may be true, this is not the reason why the repair is made at this age; these children

may need multiple surgeries as the palate develops.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Cleft Lip and Cleft Palate, Data Base

74. **Answer: 2, 1, 4, 5, 3.**

2 These infants frequently have difficulty swallowing secretions as well as difficulty breathing after surgery. Nursing measures, such as placing the infant in a partial side-lying position or gently aspirating secretions from the mouth or nasopharynx, may be necessary to prevent aspiration and respiratory complications. 1 Vomiting may compromise the airway and should be prevented. 4 Infants have a delicate fluid and electrolyte balance; parenteral fluid administration should be monitored to ensure that excessive fluids are not administered. These children are transitioned to oral fluids quickly. 5 This eventually will be done after the initial safety needs of the infant are met and the infant is ready for oral fluids. 3 Of the interventions listed, this is the least important in relation to the infant's immediate needs postoperatively.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Cleft Lip and Cleft Palate, Nursing Care

75. **3 The olive-like mass is caused by the thickened muscle (hypertrophy) of the pyloric sphincter.**

1 The obstruction is above the intestinal area; the colon is not involved. 2 There is no significant tenderness in the abdomen. 4 There is little or no peristalsis in the intestines.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Hypertrophic Pyloric Stenosis, Data Base

76. **2 Hypertrophy of the pyloric sphincter (HPS) causes partial and then complete obstruction. Nonprojectile vomiting progresses to projectile vomiting, which rapidly leads to dehydration.**

1 The infant's cry is not affected by HPS; there does not appear to be pain associated with this condition, except for the pain of hunger. 3 This can be expected with a tracheoesophageal fistula, but not with HPS. 4 The characteristics of the stool are not relevant when assessing an infant with HPS.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Hypertrophic Pyloric Stenosis, Nursing Care

77. **3 Initial feedings of glucose and electrolytes in water or breast milk are given 4 to 6 hours after surgery. When clear fluids are retained, formula feedings are begun within 24 hours.**

1 This is not necessary. Regular formula should be started within 24 hours after surgery in an attempt to gradually return the infant to a full feeding schedule. 2, 4 This is not necessary.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hypertrophic Pyloric Stenosis, Nursing Care

78. **3 Assessment of the IV site is a priority. The infant will need IV fluids until able to**

**feed orally.**

**1** Restraints are not needed. **2, 4** This is not the priority action.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hypertrophic Pyloric Stenosis, Nursing Care

**79. 2 An elevated position allows gravity to aid in preventing vomiting.**

**1** Movement increases the chance of vomiting. **3** This will not prevent reflux and may result in aspiration. **4** Activity increases the chance of vomiting.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hypertrophic Pyloric Stenosis, Nursing Care

**80. 2 Human milk has a laxative effect that promotes a soft stool; breastfed infants rarely become constipated.**

**1** There are no data to indicate that this infant has an allergy to milk. **3, 4** This is unnecessary.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Anorectal Anomalies, Data Base

**81. 4 Because phenylalanine is an essential amino acid, it must be provided in quantities sufficient for promoting growth while maintaining safe blood levels.**

**1** Phenylalanine is derived from protein, not fat. **2** An enriched protein diet contains increased amount of proteins, including phenylalanine, which should be ingested in limited amounts. **3** Phenylalanine is an essential amino acid and cannot be totally removed from the diet.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 30, Phenylketonuria (PKU), Data Base

**82. 1 In phenylketonuria, the absence of the hepatic enzyme phenylalanine hydroxylase prevents metabolism (hydroxylation to tyrosine) of the amino acid phenylalanine. The increased fluid levels of phenylalanine in the body and the alternate metabolic by-products (phenylketones) are associated with severe mental retardation if not identified and treated early.**

**2** Testing for PKU cannot be done until after several days of milk ingestion. **3** Medications are not part of therapy for PKU. **4** PKU is transmitted by an autosomal recessive gene.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Phenylketonuria, Data Base

**83. 4 To achieve optimal metabolic control, it is recommended that people with classic phenylketonuria (PKU) remain on a low-phenylalanine diet for life.**

**1, 2** The nurse should respond truthfully and provide clients with up-to-date information; dietary restrictions are recommended for life. **3** This is no longer recommended; dietary restrictions are recommended for life.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Phenylketonuria, Data Base

**84. 2 Obesity is a common nutritional problem of children with Down syndrome. It is thought to be related to excessive caloric intake and impaired growth.**

**1** This is a nutritional disorder related to vitamin D deficiency; it usually is not encountered in these children. **3** This is the most common nutritional problem in children with an iron deficiency. **4** This is an eating disorder of infancy characterized by repeated regurgitation without a gastrointestinal illness.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Trisomy 21, Data Base

**85. Answer: 3, 5.**

**1** Weak pulse is unrelated to intestinal obstruction. **2** Hypotonicity is unrelated to intestinal obstruction. **3** Paroxysmal pain is related to the peristaltic action associated with intestinal obstruction. **4** A high-pitched cry is unrelated to intestinal obstruction; it is related to neurological problems. **5** Abdominal distention pushes the diaphragm upward, causing respiratory distress characterized by grunting respirations.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Intestinal Obstruction, Data Base

**86. 2 The traditional efforts to explain and treat colic center on the paroxysmal abdominal pain; multiple factors appear to be involved, such as immaturity of the intestinal nervous system and lack of normal intestinal flora.**

**1** Peristalsis is effective because these infants thrive physically and gain weight. **3, 4** The etiology of colic is unknown at this time.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Colic, Data Base

**87. 2 A full thickness rectal biopsy removes some rectal tissue, which is examined microscopically for the absence of ganglion cells.**

**1** A colonoscopy is not necessary to obtain a rectal biopsy. **3** Saline enemas may relieve the obstruction, but they are not a definitive diagnostic tool; a barium enema may be used for diagnosis after the age of 2 months. **4** This is not used to diagnose the cause of an intestinal obstruction in infants.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Hirschsprung Disease, Data Base

**88. 2 Tap water enemas are hypotonic and are contraindicated; they may cause increased absorption of fluid via the bowel and may upset the balance of fluid in the body. There also is interference with potassium ion balance; this electrolyte can be lost via the large intestine.**

**1** The enema removes waste products from the bowel, not nutrients. **3** Fear of intrusive procedures is typical of preschoolers, not infants. **4** The temperature of the water is regulated, so this is not a concern.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Hirschsprung Disease, Data Base

**89. 3 Unless ordered, no more than 360 mL of solution should be administered to a young child because fluid and electrolyte balance in infants and children is easily disturbed.**

**1** This quantity may be ordered for a small infant. **2** This quantity may be ordered for an older or larger infant. **4** This quantity is too much for a toddler.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Knowledge; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hirschsprung Disease, Data Base

**90. 4 If the circulation is overloaded with too much fluid or the rate is too rapid, the stress on the heart becomes too great and cardiac overload may occur.**

**1** Increased output is not the primary concern. **2** Although fluid replacement is important, prevention of cardiac problems from fluid overload is critical. **3** This is important, but an infiltrated IV is not as serious as a cardiac complication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Diarrhea, Nursing Care

**91. 2 Weight is the best indicator of fluid loss or gain if measured each day at the same time, on the same scale, and with the same amount of clothing; 1 liter of fluid weighs 2.2 pounds.**

**1** Oral rehydration therapy (ORT) is employed first; IV therapy is instituted only if there is severe dehydration. **3** Nutrition is not a concern at this time. **4** Although important, this is not the priority.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Diarrhea, Nursing Care

**92. 2 Excessive vomiting causes an increased loss of hydrogen ions (hydrochloric acid), which leads to metabolic alkalosis, an excess of base bicarbonate.**

**1** Acidosis is caused by retention of hydrogen ions and a loss of base bicarbonate, which is more likely to occur with diarrhea. **3** Hypokalemia, not hyperkalemia, will occur. **4** With the loss of chloride ions, hyponatremia is more likely to occur.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Vomiting, Data Base

**93. 1 An infant's intravascular compartment is limited and cannot accommodate a large volume of fluid administered in a short time. Equipment such as an infusion pump with a volume-control chamber should be used because it controls the prescribed amount of fluid to be infused.**

**2** IV fluids for an infant are administered via an infusion pump, not through intravenous tubing via gravity. **3** This is the health care provider's role. **4** IV fluids are administered at room temperature.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Diarrhea, Nursing Care

**94. 4 The average respiratory rate for infants is 35 breaths/min. Tachypnea requires further investigation.**

**1** This temperature is within the expected range for infants. **2** This blood pressure is within the expected range for infants. **3** This heart rate is within the expected range for infants.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Cardiac Malformations, Data Base

**95. 3 Heart failure is characterized by a decrease in the blood flow to the kidneys, causing sodium and water reabsorption, resulting in peripheral edema. The peripheral edema indicates severe cardiac decompensation.**

**1, 2** This is an early attempt by the body to compensate for decreased cardiac output. **4** This occurs most noticeably in children with acute post streptococcal glomerulonephritis (APSGN), not heart failure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Cardiac Malformations, Data Base

**96. 3 Children with cardiac malformations often require more energy to achieve the activities of daily living; decreased oxygen utilization and increased energy output in the developing child result in a slow growth rate.**

**1** Mental retardation is not a common finding in children with congenital heart disease. **2** Cardiac anomalies are more often a result of prenatal, rather than genetic, factors. **4** Clubbing is not characteristic of most children with cardiac anomalies, only of those with more severe hypoxia.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Cardiac Malformations, Data Base

**97. 3 Polycythemia, reflected in an elevated hematocrit, is a direct attempt of the body to compensate for the decrease in oxygen to all body cells caused by the mixture of oxygenated and deoxygenated circulating blood.**

**1** This is not characteristic of heart malformations that cause a right-to-left shunting of blood. **2** Edema is not a common finding with heart malformations associated with a right-to-left shunting of blood. **4** This is characteristic of coarctation of the aorta, an obstructive malformation.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Cardiac Malformations, Data Base

**98. 2 The intrapleural space must be drained of fluid and air to facilitate the reestablishment of negative pressure in the intrapleural space.**

**1** The tidal volume increases as the lung reexpands, but it is not the reason for the insertion of chest tubes. **3** Intrapleural pressure should be negative, not positive; positive intrapleural pressure causes collapse of the lung. **4** Closed chest drainage is related to intrapleural pressure, not pericardial and chest wall pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Cardiac Malformations, General Nursing Care of Children with Cardiac Malformations

**99. 4 Before birth, fetal oxygenated blood is shunted directly into the systemic circulation via the ductus arteriosus, a connection between the pulmonary artery and the aorta. After birth, the increased oxygen tension causes a functional closure of the ductus arteriosus. Occasionally, particularly in preterm infants, this vessel remains open and is**

**known as patent ductus arteriosus.**

**1** This is not the problem in patent ductus arteriosus. **2** This describes a ventricular septal defect. **3** This describes pulmonic stenosis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Defects with Increased Pulmonary Blood Flow, Patent Ductus Arteriosus (PDA)

**100. 4 With a left-to-right shunt, blood flows through a defect in the ventricular wall of the heart and is shunted from the higher-pressure left side to the lower-pressure right side. The increased blood flow from the right ventricle results in an increased blood flow to the lungs.**

**1** Polycythemia and an increased hematocrit are not common in children with a left-to-right shunt. **2** This is not common in children with a left-to-right shunt. **3** Clubbing is a more common finding in children with a right-to-left shunt.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Cardiac Malformations, Data Base

**101. 4 Coarctation of the aorta is a narrowing of the aorta, usually in the thoracic segment, causing decreased blood flow below the constriction and increased blood volume above it.**

**1** The radial pulses are bounding. **2** This is not related to coarctation of the aorta. **3** The femoral pulses are weak or absent.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Obstructive Defects, Coarctation of the Aorta

**102. 3 Compromised heart functioning causes decreased cardiac output; this often results in cyanosis and fatigue from ineffective sucking and swallowing.**

**1** When a feeding problem persists in a neonate, it generally is an indication of some pathology. **2** Inadequate sucking is never insignificant; it may be indicative of many problems, such as central nervous system involvement or immaturity as well as heart disease. **4** Healthy newborns are free from mucus within 24 to 48 hours after birth.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Defects with Increased Pulmonary Blood Flow, Ventricular Septal Defect (VSD)

**103. 2 Hemorrhage is a major life-threatening complication because arterial blood is under pressure and a catheter has been inserted into an artery.**

**1** The child is kept in bed for 6 to 8 hours after an arterial catheterization. **3** Fluids may be given as soon as tolerated. **4** Pulses, not blood pressure, must be compared for quality and symmetry.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Cardiac Malformations, General Nursing Care of Children with Cardiac Malformations

**104. 3 Circumoral cyanosis is not a specific characteristic of Down syndrome. It is a clinical finding associated with congenital heart disease, which these infants may have**

**as a concurrent problem.**

**1** A flat occiput and a broad nose with a depressed bridge (saddle nose) are head and facial features of children with Down syndrome. **2** Small, misshapen, low-set ears are a clinical manifestation of Down syndrome. **4** Children with Down syndrome often keep their mouths open and their tongue protrudes; the surface of the tongue is often wrinkled.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 30, Trisomy 21, Data Base

**105. 3 Tetralogy of Fallot consists of four defects. Three of them are anatomic: ventricular septal defect, pulmonic stenosis, and overriding aorta. The fourth defect, right ventricular hypertrophy, is secondary to increased resistance to blood flow in that ventricle.**

**1, 4** Although there is right ventricular hypertrophy, the other defects are not associated with tetralogy of Fallot. **2** These are the characteristics of transposition of the great vessels.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 30, Defects with Decreased Pulmonary Blood Flow, Tetralogy of Fallot

**106. 2 Decreased tissue oxygenation stimulates erythropoiesis, resulting in excessive production RBCs.**

**1, 4** This is not a direct cause of polycythemia. **3** This may or may not affect the production of RBCs.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 30, Defects with Decreased Pulmonary Blood Flow, Tetralogy of Fallot

**107. 2 Hypoxia leads to poor peripheral oxygenation of tissues; clubbing develops over time as a result of tissue hypertrophy and additional capillary development in the fingers.**

**1** The respirations generally are rapid to compensate for oxygen deprivation. **3** These children have polycythemia. **4** These do not occur in children with tetralogy of Fallot.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

**Assessment/Analysis; Reference:** Ch 30, Defects with Decreased Pulmonary Blood Flow, Tetralogy of Fallot

**108. 3 Forceful evacuation results in taking a deep breath, holding it, and straining (Valsalva maneuver). This increases intrathoracic pressure, which puts excessive strain on the heart sutures.**

**1** Crying is not a problem after cardiac surgery; it may, in fact, help prevent respiratory complications. **2** Coughing and deep breathing are essential for the prevention of postoperative respiratory complications. **4** Activity is gradually increased.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 30, Cardiac Malformations, Data Base

**109. 2 This is a priority because inadequate antibiotic therapy may predispose the infant**

**to the development of bacterial endocarditis.**

**1, 3, 4** This is not a priority because instructions usually are printed on the label.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Cardiac Malformations, Data Base

**110. 3** Gavage feeding is preferred for weak infants, those with respiratory distress or ineffective sucking-swallowing coordination, and those who are easily fatigued. It conserves energy and reduces the workload of the heart.

**1** This is not a reason for instituting gavage feedings; however, vomiting may be lessened because the amount and rapidity of the feeding can be controlled. **2** Feeding the infant quickly is not desirable; vomiting with aspiration may occur. **4** The amount can be regulated with oral formula feeding as well.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Cardiac Malformations, Data Base

**111. 3** Antibodies received in utero through the placenta and in the newborn via the mother's breast milk provide the infant with immunity against most viral, bacterial, and fungal infections during the first several weeks after birth. Then, as the titer of maternal antibodies drops and is not replaced by the infant's own antibodies, prolonged and repeated infections occur.

**1** This is not enough to prevent infections in these infants. **2** Bacteria do not produce antibodies. **4** This probably does not occur in infants born without an immune system.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis, **Reference:** Ch 30, Immunizations

**112. 2** This is the expected hematocrit range for a 1-year-old infant.

**1** This is too low; it occurs with problems such as prolonged blood loss. **3** This is too high; this is the expected hematocrit for an adult female. **4** This is too high; this is the expected hematocrit for a newborn.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Growth and Development, Ten to Twelve Months

**113. 2** Toxoids are modified toxins that stimulate the body to form antibodies that last up to 10 years against the specific disease.

**1** Passive immunity, even the natural type derived from the mother, does not last longer than the first year of life. **3** Only having had the disease can provide lifelong natural immunity. **4** This is provided by tetanus immune globulin.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Immunizations

**114. Answer: 2, 4, 5.**

**1** Rubeola (measles) vaccine is made from a live attenuated virus. **2** Pertussis (whooping cough) vaccine is made from inactivated toxins. **3** Varicella (chicken pox) vaccine is made from a live attenuated virus. **4** It is safe to receive the inactivated poliovirus

vaccine; it is not a live attenuated virus vaccine. 5 Tetanus immune globulin is an antitoxin that provides transient passive immunity; tetanus toxoid is contraindicated.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 30, Immunizations

**115. 1 Varicella (chickenpox) is caused by a virus and may be followed by encephalitis. It is characterized by skin lesions.**

**2** Scarlet fever is caused by a bacterium and does not result in encephalitis. **3** Although poliomyelitis is caused by a virus, it does not result in encephalitis. **4** Whooping cough (pertussis) is caused by a bacterium and does not result in encephalitis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 30, Immunizations

**116. 1 The signs and symptoms of rubeola (measles) include a high fever, photophobia, Koplik spots (white patches on mucous membranes of the oral cavity), and a rash.**

**Rubella (German measles) usually does not cause a high fever, runs a 3- to 6-day course, and never causes Koplik spots.**

**2** The rash of rubeola (measles) spreads over most of the body. **3** These clinical findings are vague and occur with many illnesses. **4** Some signs and symptoms may be similar to those of a severe cold, but rubeola is associated with high fever.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 30, Immunizations

**117. 1 The American Academy of Pediatrics and the Centers for Disease Control and Prevention are not recommending the IM polio vaccine because of the danger of acquiring vaccine-associated polio paralysis (VAPP) with the oral vaccine.**

**2** Both vaccines are not equally safe; the intramuscular one is safer. **3** Cost is not the issue; safety is. The oral vaccine is less expensive. **4** If the infant is immunocompromised, the health care provider will discuss with the parents whether the vaccine should be administered.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Immunizations

**118. 2 Steroids have an immunosuppressive effect. It is thought that resistance to certain viral diseases, including varicella, is greatly decreased when a child takes steroids regularly.**

**1** There is no known correlation between varicella and insulin. **3** Because varicella is a viral disease, antibiotics will have no effect. **4** There is no known correlation between varicella and anticonvulsants.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Immunizations

**119. 3 Varicella (chickenpox) begins with a slight fever, malaise, and anorexia. After 24**

hours a highly pruritic rash begins with a macule, progressing to papules, and then vesicles that break easily. The rash spreads in a centripetal manner from the trunk to the face and proximal extremities. Secondary bacterial complications (e.g., encephalitis, pneumonia, and hemorrhagic varicella) are potential complications.

**1** This is a benign childhood communicable disease; complications are rare; women of childbearing age should be vaccinated because rubella, if contracted in early pregnancy, can cause congenital anomalies in the newborn. **2** Rubeola (measles) produces coldlike respiratory symptoms and, after 3 or 4 days, a dark-red macular or maculopapular skin rash. **4** Scarlet fever is a bacterial infection that responds to antibiotic therapy and does not cause major complications.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Immunizations

**120. 4 Scheduled immunizations for preschool children include DTaP, IPV, and MMR at 4 to 6 years (usually required by law).**

**1** Hepatitis immunization is given in three doses between birth and 9 months; tetanus/diphtheria vaccine is given at 7 to 10 years of age, with subsequent doses based on the age when the vaccine was first received. **2** Hepatitis B immunization is not required once immunity is established; a subsequent dose of tetanus/diphtheria vaccine is given based on the age when first received. **3** *Haemophilus influenzae* vaccine is given at 12 to 15 months.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Immunizations

**121. 2 The recommended immunization schedule for infants is administration of the combined diphtheria, tetanus, acellular pertussis (DTaP), and inactivated poliovirus (IPV) vaccines at ages 2, 4, and 6 months.**

**1** Measles vaccine is not usually administered until the infant is a minimum of 12 months old. **3** Rubella vaccine is not usually administered until a minimum of 12 months of age; there is no tuberculosis vaccine. **4** Measles, mumps, and rubella vaccines are not given until a minimum of 12 months; there is no tuberculosis vaccine.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Knowledge; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 30, Immunizations

**122. 2 The protocol of the Centers for Disease Control and Prevention (CDC) for administering parenteral medications requires standard precautions, which include the use of gloves.**

**1** It is the nurse's responsibility to maintain standard precautions within the clinic environment. **3** Gloves are needed and must be worn when children receive parenteral medications. **4** The child's appearance is not a factor; the CDC protocol for administering parenteral medications requires standard precautions.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

**123. 2 The MMR vaccine is composed of live attenuated viruses, and its administration**

**could be life-threatening for an immunosuppressed child.**

**1** When the infant reaches 12 to 15 months of age and if the blood values have returned to normal, the MMR vaccine should be given. **3** Because the MMR vaccine is composed of live viruses, giving it while the infant is immunosuppressed can be as life-threatening as having the disease. **4** It is the nurse's responsibility to provide this information at the time of discharge.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 30, Immunization

**124. 1** The blue-white spots in the mouth are Koplik spots, which appear before the rash and subside about 2 days after the rash is visible. They are a cardinal sign of rubeola (measles).

**2** The rash of varicella (chickenpox) is distinctive because the papules become vesicles. There are no Koplik spots. **3** Erythema infectiosum (fifth disease) has a characteristic erythematous rash that appears first on the face and then spreads to the extremities. There are no Koplik spots. **4** Scarlet fever is caused by group A beta-hemolytic streptococcus bacteria. Although the mouth is affected, as evidenced by the typical "strawberry tongue," there are no Koplik spots.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Immunizations

# Care of Toddlers

125. Answer: 9.5 mg. Since there are 2.2 pounds per kilogram, the child's weight of 28 lb is equal to 12.7 kg. The safe dose is determined by multiplying the child's weight in kilograms by 35 ( $12.7 \times 35$ ), which is 444.5 mg/24 hours. To calculate the child's dose in 24 hours, multiply the prescribed dose (145 mg) by 3, which equals 435 mg in 24 hours. Subtract 435 from 444.5, which equals 9.5 mg. Because the daily dose is 9.5 mg less than the maximum safe daily dose of 444.5 mg, it is safe to administer this amount of medication.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

126. 4 A specific dose per kilogram of body weight prevents overdose; there is a large range in weight for specific ages, and a uniform dose based on age could be unsafe or ineffective.

1 This may result in an inadequate dose. 2 Medication is important; the child has a fever. 3 This is unsafe because of the wide range of weights for a specific age group.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

127. 2 When unexplained injuries are found, further assessment is required because it is the nurse's legal responsibility to report suspected child abuse.

1 This is just one aspect of assessment for child abuse. 3 This is not related to scars on the child's back. 4 Although chickenpox may leave scars, there are no welts.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Child Maltreatment, Nursing Care

128. 2 The nurse should obtain clarification as to the parent's specific concerns regarding the child's behavior.

1 Although this may be true, it cuts off communication; further communication should be encouraged. 3 This response assumes the parents have been inconsistent; the nurse needs more information. 4 This is inappropriate because the nurse is explaining a developmental factor without exploring what the parent means.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Growth and Development, Developmental Timetable

129. 3 It is the nurse's legal responsibility to report child abuse to the appropriate agency.

1 Although the police may be notified, this is not the nurse's responsibility at this time. 2 This may be done later, but it is not the priority. 4 The girl's pregnancy has not been confirmed; at this time it is most important to protect her and her sisters.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 31, Child Maltreatment, Data Base

**130. 4 A child who exhibits signs of abuse needs close supervision, especially when members of the family visit.**

**1** The child needs close monitoring and should not be left alone. **2** An older child who exhibits signs of friendliness may be threatening to this child. **3** This may be desirable from a developmental level, but it does not meet the child's safety needs.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Child Maltreatment, Nursing Care

**131. 2 If able to handle personal anxiety and give comfort to the toddler, parents can be helpful to the staff as well as the child. If, however, the parents have moderate to severe anxiety, their anxiety can be transmitted to the child.**

**1** It is how the parents cope with the situation, rather than the situation itself, that helps determine how helpful their presence may be. **3** Developmentally, toddlers fear separation from their parents; also they are cognitively unable to make decisions of this nature. **4** Parents usually want to participate in their child's care despite the child's response to pain.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:**

Caring; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**132. 4 A 2-year-old toddler is still attached to and dependent on the parents. Fear of separation is a great stress.**

**1** This is neither possible nor desirable. **2** This probably will not be remembered accurately. **3** This is not possible in a health care setting.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**133. 2 The second stage of separation anxiety is despair, in which the child is depressed, lonely, and disinterested in the surroundings.**

**1** The third stage of separation, denial or detachment, occurs later as hospitalization becomes prolonged. **3** The child is suffering from separation anxiety, which does not include a stage of mistrust. **4** The child is suffering from separation anxiety, which does not include a stage of rejection.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 31, Hospitalization of Toddlers, Data Base

**134. 1 Superficial interest in the environment and friendly interactions with strangers are typical responses of a toddler who has experienced prolonged separation from parents because of illness. It is the third stage of separation anxiety known as detachment.**

**2, 4** This behavior is typical of the second stage of separation anxiety known as despair. **3** This behavior is typical of the first stage of separation anxiety known as

protest.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 31, Hospitalization of Toddlers, Data Base

**135. 1 Detachment is the result of trying to escape the emotional pain of desiring the mother by repressing feelings for her.**

**2** This interpretation is not appropriate to the situation. **3** This conclusion cannot be drawn from this situation. **4** This response lacks insight.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 31, Hospitalization of Toddlers, Data Base

**136. Answer: 1, 2, 3.**

**1** Toddlers are entering the developmental stage of creative and imaginative play. Having an imaginary tea party is a safe, appropriate activity for a toddler. **2** Using clay to make shapes, both with and without a mold, enhances toddlers' creativity and improves their fine motor coordination. **3** Creative, imaginative, and imitative play is associated with toddlers. **4** A 3-year-old child is too young to manipulate a pen or pencil and may cause self-injury or an injury to others. **5** A 3-year-old child does not have the cognitive ability or the fine motor coordination to play simple video games.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Play during Toddlerhood

**137. 1 The medicine cabinet is not a safe place for medications; toddlers are curious, and capable of climbing and opening cabinets.**

**2** Toddlers are curious and love to climb. They must be protected from dangerous areas such as stairs. Secured gates at the top and bottom of stairs provide a barrier. **3** At a height of 36 inches a toddler is ready to use a bed; the average toddler reaches this height at age  $2\frac{1}{2}$  years. **4** Shoes with Velcro can be secured without leaving trailing shoelaces that can untie and cause falls.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 31, Health Promotion of Toddlers, Injury Prevention during Toddlerhood

**138. Answer: 3, 1, 4, 2, 5.**

**3** A compromised airway may occur with burns to the face and chest due to inhalation of hot gases and smoke; they cause mucosal damage and edema. **1** Deep partial thickness burns are painful; pain management is a priority after maintenance of a patent airway and promotion of gas exchange. **4** Because of the fluid and electrolyte losses within the first 24 to 36 hours and the resulting shift of electrolytes after the first 24 to 36 hours, fluid and electrolyte balance become a priority after airway maintenance and pain management. **2** Prevention of infection becomes a priority after airway maintenance, pain management, and maintenance of fluid and electrolyte balance; the potential for infection increases as the postinjury time frame progresses because of the damaged dermis. **5** Body image becomes more of a priority after immediate physiological needs

are met.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 31, Burns, Nursing Care

**139. 2 The poison control center has the most current and up-to-date information on how to treat any poison. Also, the center can advise whether to bring the child to the hospital and what data to collect to bring with them if they go to the hospital.**

**1** The administration of syrup of ipecac is no longer recommended by the American Academy of Pediatrics. It is contraindicated if the ingested poison is a corrosive substance or a hydrocarbon; also, it is contraindicated if the child is comatose or having seizures. In addition, prescribing medication is outside the legal role of the nurse. **3** A potential poisoning may or may not require emergency intervention; with expert advice the child may be treated in the home. Also, the experts at the poison control center can provide advice about initial interventions at home before going to the hospital. **4** This is unsafe. No treatment should begin before obtaining information about the amount and kind of substance ingested and the advice of a health care provider.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 31, Poisoning, Nursing Care

**140. Answer: 2, 4, 5.**

**1** At 15 months, children do not have the emotional ability to share toys; this begins during the preschool years. **2** At 15 months, children have the dexterity and swallowing ability to drink from a cup and use a spoon. **3** This ability usually occurs when the child is 2 years old. **4** At 15 months, strength and balance have improved, and the toddler can stand and walk alone. **5** At 15 months, children enjoy throwing objects and picking them up.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Growth and Development, Fifteen Months

**141. 2 The psychosocial need during the early toddler age is the development of autonomy. The toddler objects strongly to discipline.**

**1** Excessive discipline leads to feelings of shame and self-doubt, the major crisis at this stage of development. **3** It is frightening for a toddler to be left alone; it leaves the child with feelings of rejection, isolation, and insecurity because toddlers do not understand the reason for the punishment. **4** The development of initiative is attained during the preschool age, not during the toddler age.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 31, Growth and Development, Eighteen Months

**142. 1 Children who are expressing negativism need to have a feeling of control. One way of achieving this within reasonable limits is for the parent or caregiver to provide a choice of two items, rather than force one on the child.**

**2** This will not achieve the goal of giving fluids. **3** This probably will not be successful with a toddler. **4** This will complicate the situation and further inhibit the child's willingness to take fluids.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Childhood Nutrition

**143. 3 The nurse should try to comfort the child by staying near until the child feels more relaxed. The bathing can be postponed until the child has had time to test the environment and is less anxious.**

**1** This may frighten the child more because the nurse is a stranger. **2** This action does not attempt to relieve the child's anxiety and will probably cause it to increase. **4** Basic physiological needs must be met and postponing the bath for a day would be negligent. However, the nurse should attempt to reduce the child's anxiety first.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**144. 3 Appropriate limit setting and discipline are necessary for children to develop self-control while learning the boundaries of their abilities.**

**1** Learning to share occurs during the preschool years. **2** Roles within society are learned by the school-age child. **4** Internal controls begin in the preschool years.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Growth and Development, Major Learning Events

**145. Answer: 1, 2.**

**1** Common developmental norms of the toddler, who is struggling for independence, are an inability to share easily, egotism, egocentrism, and possessiveness. **2** Toddlers have a basic understanding of language and the cognitive ability to follow simple directions. **3** This task is too advanced for toddlers. **4, 5** This is true of preschool-age children.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Growth and Development, Two Years

**146. 2 The child should be taken to the dentist between 2 and 3 years of age, when most of the 20 deciduous teeth have erupted.**

**1, 3** This is too late. **4** This is too indefinite.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Growth and Development, Thirty Months

**147. 4 The toddler is in Erikson's stage of acquiring a sense of autonomy. The negativism is the result of the child's need for self-expression and for testing the environment.**

**1** This is the developmental goal achieved in infancy. **2** Although this is a factor, toddlers assert themselves in an attempt to attain more autonomy. **3** Children do not assert themselves to obtain discipline.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Growth and Development, Two Years

**148. 2 Ignoring the tantrum while staying close by provides security while not giving attention to and reinforcing the behavior.**

**1** Although toddlers may be easily distracted, offering a toy will reinforce the negative behavior.

**3** It is unreasonable to tell the parent to find someone to baby-sit the child; this may not be a viable option. **4** Giving the child the item acknowledges the tantrum and reinforces the behavior.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**149. 4 These are foods that a toddler enjoys and can handle; in addition, they are nutritious.**

**1** Grapes are dangerous because toddlers may choke on the skins and shape of the grape. **2** These fried foods have a high fat content and if eaten regularly can lead to obesity. **3** The skin and shape of a hot dog may cause choking, and potato chips are not nutritious.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Childhood Nutrition

**150. 3 Bed-wetting accidents are not uncommon in this age group, especially during hospitalization when regression may occur. Therefore, the best approach is to ignore the event.**

**1** The child may interpret this as punishment; punishment for regressive behavior is inappropriate. **2** Because skin breakdown is a concern, rubber sheets are contraindicated; they hold moisture close to the skin. **4** This may make the child feel guilty for the behavior.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**151. 4 This is a task expected of 3-year-old children.**

**1** This is a task expected of 4- or 5-year-old children. **2, 3** This is a task expected of 4-year-old children.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Growth and Development, Thirty Months

**152. Answer: 3, 5.**

**1** This is unsafe; a toddler may choke because of the shape of the grape and its skin. **2** Cold food and fluids may precipitate bronchospasms and should be avoided. **3** Apple slices are easy to handle and chew and provide excellent nutrition for a toddler. **4** Cookies are high in fat and sugar and are not as healthy as fruit. **5** Vegetables cut up into small pieces can be handled and chewed effectively by a

2-year-old child; also, they are nutritious and prevent constipation. **6** Cold fluid may cause bronchospasms.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Childhood Nutrition

**153. 1 The toddler is still dependent on the primary care giver, is narcissistic, and plays alone, but is aware of others playing nearby.**

**2** Solitary play or onlookers' play is characteristic of infants. **3** Cooperative play starts in the preschool years. **4** Competitive play is seen in school-age children.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Play during Toddlerhood

**154. 3 It is not until 2 years of age that toddlers are able to use their feet to walk upstairs instead of crawling.**

**1** Talipes equinovarus is identified using other criteria. **2** At 18 months of age the inability of the toddler to use the feet to go upstairs is not a problem; it is expected. **4** Developmental dysplasia of the hip (DDH) is identified using other criteria.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Growth and Development, Eighteen Months

**155. Answer: 3, 4.**

**1** An infant will enjoy a mobile. **2** This is too advanced for a 2-year-old child. **3** A pounding toy allows for gross motor movements as well as an avenue to expend energy and feelings. **4** Clay (Play-Doh) is age-appropriate and nontoxic; manipulating, rolling, and pounding it may help work out feelings about being hospitalized. **5** This may be too complicated for a toddler.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Play during Toddlerhood

**156. 2 More information is needed; developmental delays suggest some milestones for age are not being met at the average time; it is not synonymous with cognitive impairment.**

**1** This is inappropriate; more information must be obtained. **3** Although the health care provider may help, it is not yet known if such a program is needed. **4** The nurse does not know this without more information.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 31, Cognitive Impairment, Nursing Care

**157. 3 Echolalia in a 2-year-old child may be a sign of autism; imitation of sounds begins at about 6 months of age and may continue for several more months. The average 2-year-old child has a 300-word vocabulary and uses 2- to 3-word phrases.**

**1** It is not until 30 months of age that the toddler is able to stand on one foot. **2** Building a tower of 5 to 6 blocks is expected at the age of 2 years. **4** Although the pincer grasp is achieved at 11 months, it is not until age 30 months that the toddler is expected to hold

crayons with the fingers rather than the fists and be able to color within the lines of a picture.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Growth and Development, Two Years

**158. 1 The parents' attitude, approach, and understanding of the child's physical and psychologic readiness are essential to letting the child proceed at his or her own pace with appropriate parental intervention.**

**2** This is not the major motivation for toilet training. **3** Although this is definitely a factor, it is not a major one. **4** This, of course, is a factor, but the major factor is the child, who is strongly influenced by the parents' attitudes and approach.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 31, Growth and Development, Major Learning Events

**159. 4 A pounding board with pegs to hammer into holes is a safe toy for toddlers because it is fairly large, easy to manipulate, and sturdy. A pounding board provides an acceptable way for anger to be expressed.**

**1** The child's motor and hand-eye coordination are too immature for using these. **2** This is not as effective for releasing anger; it may be thrown about, causing injury or damage. **3** This is appropriate for an older child with more mature motor coordination to compensate for a moving object.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**160. 4 Until trust has been reestablished, the child will be unable to develop an emotional tie to the mother.**

**1** After trust has been reestablished, the child may then test the parent's love by being very demanding. **2** At this stage of separation anxiety, the child is too detached to be hostile. **3** The child will be despairing and withdrawn, not cheerful.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 31, Hospitalization of Toddlers, Data Base

**161. 3 A 15-month-old toddler will have difficulty complying with directions to remain still and may be extremely frightened by the equipment. Sedatives usually are prescribed.**

**1** This is not necessary; the head must remain still but need not be shaved. **2** This is not necessary unless a contrast medium is being used. **4** The child is too young to understand even a simple explanation of the procedure.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 31, Hospitalization of Toddlers, General Nursing Care of Toddlers

**162. 2 Braces are worn to enable the spastic child to control movement. They also prevent deformities that can occur from misalignment.**

- 1** Early ambulation is promoted by maintaining muscle strength and tone, but it is not the reason for applying braces. **3** Exercises, not braces, are used to stretch ligaments and improve muscle strength and tone. **4** This is not the purpose of braces and shoes. The child is in Erikson's stage of industry versus inferiority, and the braces and shoes will promote independence.
- Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Cerebral Palsy, Nursing Care
- 163. 1 Individuals whose thermoreceptive senses are impaired are unable to detect changes or degrees of temperature. They must be taught to first test the temperature in any water-related activity to prevent scalding and burning.**
- 2** Overtightening brace straps may lead to circulatory impairment and/or skin breakdown. **3** The child with cerebral palsy has uncontrolled movement of voluntary muscles and does not need to change positions at night to prevent skin breakdown. **4** This is dangerous because this action alters the center of gravity; with practice the child will be able to place the legs in the appropriate position for walking without looking down.
- Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Cerebral Palsy, Nursing Care
- 164. 1 The damage is fixed. It does not progressively worsen.**
- 2** Cerebral palsy (CP) is a nonprogressive chronic condition, and its effects are predictable. **3** Although mental retardation may be present in some children with cerebral palsy, all children with this disorder are not mentally retarded. **4** A variety of prenatal, perinatal, and postnatal factors contribute to the development of CP. It is estimated that the cause of CP is unknown in as many as 80% of people with the disorder.
- Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Cerebral Palsy, Data Base
- 165. 3 Lead poisoning is caused by lead in the environment. Sources of lead may be deteriorating paint in a home (inhaled or ingested); lead in products that are used daily, such as batteries, pottery, and glass (ingested); and lead in the atmosphere (which can be inhaled or fall on food that is then ingested).**
- 1** Unless the fat has been exposed to lead, it is not a causative factor. **2** The role of parents is not an identified factor. **4** This is just one causative factor; there are many others.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Lead Poisoning, Data Base
- 166. 3 Damaged nerve cells do not regenerate. Once mental retardation has occurred, it is not reversible.**
- 1** Damage to kidneys is reversible with treatment. **2** Skeletal changes are not significant and are reversible as lead leaves the body. **4** Effects of lead in bone marrow are reversible when lead is mobilized for excretion in urine or deposition in bone by chelation therapy.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Lead Poisoning, Data Base

**167. 2 Irreversible neurologic and intellectual damages are the most serious consequences of lead poisoning because of cortical atrophy and encephalopathy.**

**1** Although there may be a nutritional deficit, it is not the priority. **3, 4** These do occur, but they are reversible.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Lead Poisoning, Data Base

**168. 4 The child should be given an outlet for tension, and therapeutic play using the equipment needed for the injections is the most appropriate activity.**

**1** This may ease discomfort, but an outlet for feelings takes priority. **2** Fear is not directed at unfamiliar adults but at the painful treatments. **3** This is part of the preparation, but it is not the most important; the child must be encouraged to express feelings.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Lead Poisoning, Nursing Care

**169. 4 Amblyopia is reduced visual acuity that may occur when an eye weakened by strabismus is not forced to function.**

**1** The lack of binocularity may result in impaired depth and spatial perceptions, not dyslexia. **2** Depth and spatial perceptions are impaired when vision in one eye is severely impaired. **3** Only vision in the affected eye will be diminished.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Visual Impairment, Data Base

**170. 4 In children younger than 3 years old the eustachian tube is shorter, wider, and straighter. Pulling the pinna down and back straightens the ear canal facilitating passage of fluid to the eardrum.**

**1** Pulling the pinna forward does not straighten the canal. **2** Pulling the pinna up and back is the technique used for older children and adults. **3** Pulling the pinna straight back does not help to straighten the canal.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

**171. 4 If the strabismus is not corrected, sight in the affected eye will be lost because of lack of use.**

**1** Cataracts do not result from strabismus. **2** Glaucoma is caused by increased intraocular pressure, not strabismus. **3** Refractive errors are related to visual acuity rather than strabismus.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Visual Impairment, Data Base

**172. 2 By 3 to 4 months of age, an infant should localize sound by looking in the direction of the sound.**

**1** The nurse's observation does not provide information about the infant's ability to see. **3** This response is not within the norm for this age group. **4** This response indicates that the infant's hearing is not developmentally appropriate.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Hearing Impairment, Data Base

**173. 2 Water in the ears after a myringotomy may be a source of infection.**

**1** There is no reason that the child cannot be around other children because there is no infectious process. **3** This will clog the ear canal and serves no purpose. **4** These may be used occasionally in the outer ear but should not be inserted into the ear.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Otitis Media, Nursing Care

**174. 4 This degree of hearing loss causes the child to miss approximately 25% to 40% of conversations. This loss may result in speech deficits if not corrected. Hearing aids usually help improve functioning.**

**1** There is no evidence that this hearing loss is progressive. **2** The child is missing approximately 25% to 40% of conversations, which may interfere with the educational process unless corrected. **3** The significance of the hearing loss requires further analysis and intervention.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Hearing Impairment, Data Base

**175. The posterior tibial artery is posterior to the medial malleolus on the inner aspect of the ankle. The blood pressure cuff should be positioned 1 inch above the ankle.**

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Fractures throughout Childhood, Nursing Care

**176. 4 Abusive parents may “shop” for hospitals that do not have a previous record of their child; the skeletal survey will provide a revealing injury history if there were abuse.**

**1** Pinpointing the exact location of a fracture is necessary to plan appropriate treatment

and can be done by a single x-ray film of the area; a skeletal survey is more extensive and helpful when abuse is suspected. **2** A CT scan and MRI are not required unless internal injuries are suspected. **3** Cost-effectiveness is not the primary concern if abuse is suspected.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Child Maltreatment, Nursing Care

177. **Answer: 2, 4, 5.**

**1** This is not significant; it may be related to increased fluid intake. **2** A cast is not flexible and can inhibit circulation. Cold toes, loss of sensation in toes, pain, and inability to move the toes should be reported immediately. **3** The expected pulse rate for a 9-year-old child ranges from 70 to 110 beats/min. **4** A tingling sensation in the foot may indicate excessive pressure on the nerves and circulatory system in the casted extremity. **5** A fiberglass cast dries within minutes; if it remains damp, it should be reported before 4 hours have elapsed.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 31, Fractures Throughout Childhood, Nursing Care

178. **3 This is the safest way to dry the cast evenly.**

**1** Besides the danger of burning the child, the cast may dry on the outside and remain damp within. **2** This may create a draft and be uncomfortable for the child. **4** This will impede the circulation of air and delay drying.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Fractures Throughout Childhood, Nursing Care

179. **Answer: 2, 3.**

**1** Rest with elevation of the extremity is recommended; strenuous activity should be avoided for several days. **2** When swelling of the fingers occurs, the cast can become too tight, resulting in neurovascular damage; permanent damage can occur in 6 to 8 hours. **3** The casted arm should be in a sling when the child is upright to promote venous return. **4** Joints above and below the cast should be moved to maintain flexibility. **5** The casted arm should be elevated when resting to promote venous return.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Fractures Throughout Childhood, Nursing Care

180. **1 The immediate postburn period is marked by dramatic changes in fluid and electrolyte balance. Alterations in electrolyte balance can produce confusion, weakness, cardiac irregularities, and seizures. Secondary to large fluid losses through the denuded skin, vasodilation, and edema formation, hypovolemic shock may develop.**

**2** Pneumonia is a later complication associated with immobility. **3** Contractures are a later complication associated with scarring and aggravated by improper positioning and splinting. **4** Hypotension, not hypertension, occurs with hypovolemic shock.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 31, Burns, Data Base

**181. 2 Inhalation burns usually are present with facial burns, regardless of the depth; the immediate threat to life is asphyxia from irritation and edema of the respiratory passages and lungs.**

**1** Although wound sepsis is a possible complication, it will not be evident until the third to fifth day. **3** Although the child is probably fearful, maintaining a patent airway is the priority. This child is too old for separation anxiety; however, complications related to stress can occur later. **4** Fluid losses can be extremely high but reach their maximum about the fourth day; the initial priority is maintaining a patent airway.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Burns, Nursing Care

**182. Answer: 3, 4.**

**1** This is a generalization that is not necessarily true. **2** This is not a consideration in this situation. **3** The medication begins to work in minutes; doses can be controlled. **4** Intramuscular medications are avoided when possible to prevent inadequate absorption of the medication because of damaged tissue. **5** The length of effectiveness of an analgesic is based on its therapeutic level in the body regardless of what route is used.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Burns, Nursing Care

**183. 4 The early school-age child has become a cooperative member of the family and will mimic parents' attitudes and food habits readily.**

**1** This does not have a major influence on eating habits. **2** This certainly has some influence, though not major, on eating habits. **3** The peer group does not become influential until a later school age and during adolescence.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Childhood Nutrition

**184. 4 Positioning on the right side after feeding facilitates digestion because the pyloric sphincter is on this side and gravity aids in emptying the stomach.**

**1** The feeding may begin immediately after opening the tube. **2** This may result in aspiration; the child's head and torso should be elevated. **3** If the gastrostomy tube is flushed before or after a feeding, water, not normal saline, is used.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Burns, Nursing Care

**185. 2 It is the nurse's responsibility to assess tube placement before each feeding; withdrawing gastric contents before each feeding ensures that the tip of the tube is in the stomach.**

**1, 3, 4** This is not frequent enough; the tube could be displaced between feedings.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Burns, Nursing Care

**186. 3 Children with celiac disease have a gluten-induced enteropathy and are unable to absorb fats from the intestinal tract, resulting in the typical characteristics of their**

**stools.**

**1** The stools are large and fatty or frothy, not mucoid. **2** Although the stools are large and frothy, they are pale in color because of their high fat content. **4** The stools are large and foul-smelling and have little color.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Celiac Disease, Data Base

**187. 2 Products composed of corn, rice, and millet do not contain gluten and are permitted on a low-gluten diet; tortilla chips are made from corn flour.**

**1** Pretzels contain wheat flour, which is not permitted on a low-gluten diet; products containing rye, oats, and barley are also restricted. **3** Oatmeal cookies contain oats, which are not permitted on a low-gluten diet. **4** Peanut butter crackers contain wheat flour, which is not permitted on a low-gluten diet.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Celiac Disease, Nursing Care

**188. 3 Both parents are carriers; the gene for cystic fibrosis is recessive and the parents do not have the disease.**

**1** The gene for cystic fibrosis is not a mutant gene. **2** The gene for cystic fibrosis is not located on the X or Y chromosome. **4** The gene for cystic fibrosis is inherited as a recessive, not dominant, gene.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Cystic Fibrosis, Data Base

**189. 3 Mucous secretions increase in viscosity and precipitate or coagulate to form concentrations in glands and ducts, which in turn cause obstructions. Decreased amounts of pancreatic enzymes cause impairment in the digestion and absorption of nutrients.**

**1** The eccrine (sweat) glands are not hyperactive, but there is an increased concentration of sweat electrolytes (e.g., sodium and chloride). **2** The autonomic nervous system does not play a role in the pathology of cystic fibrosis. **4** There is no alteration in the mucosal lining of the intestines.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Cystic Fibrosis, Data Base

**190. 1 Because of a lack of the pancreatic enzyme lipase, fats remain unabsorbed and are excreted in excessive amounts in the stool.**

**2, 4** This does not cause the typical characteristics of the stools. **3** These are the pancreatic enzymes, whose passage into the intestine is prevented by blocked pancreatic ducts.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Knowledge; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Cystic Fibrosis, Data Base

**191. 2 When the causative organism is isolated, it is tested for antimicrobial susceptibility (sensitivity) to various antimicrobial agents. When a microorganism is sensitive to a medication, the medication is capable of destroying the microorganism.**

**1** The tolerance of the child to the particular antibiotic is unknown, since up to this time

the child has not developed any allergies. **3** Bacteria are not selective. **4** Although the health care provider may have a preference for a particular antibiotic, it first must be determined if the bacteria have exhibited sensitivity to it.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Respiratory Tract Infections, Data Base

**192. 2 Rectal prolapse is a common gastrointestinal complication of cystic fibrosis and results from wasting of perirectal supporting tissues, secondary to malnutrition.**

**1** Anal fissures may or may not occur with cystic fibrosis. **3** Intussusception is not associated with cystic fibrosis. **4** Meconium ileus is associated with cystic fibrosis in newborns; it prevents the passage of meconium.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Cystic Fibrosis; Data Base

**193. 2 The nurse can best evaluate teaching by asking the learner for a return demonstration. Behavior, rather than words, more readily shows what has been learned.**

**1** The child may be too young to know if there are any questions. **3** A demonstration rather than an explanation can be evaluated more readily. **4** This is difficult for a 5-year-old child; the ability to articulate a concept is not that advanced, nor is the vocabulary.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

**194. Answer: 250 mL/hr. Volume control devices function on the concept of mL/hr; since the 125 mL must infuse in 30 minutes, the rate should be set at 250 mL/hr to infuse 125 mL in 30 minutes.**

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

**195. 2 Because the mucous glands secrete thick mucoid secretions that accumulate, reducing ciliary action and mucus flow, the nurse should perform postural drainage, which promotes the removal of mucopurulent secretions by means of gravity.**

**1** Coughing should be encouraged; it helps bring up secretions from the respiratory tract. **3** Although the nurse should encourage activities appropriate for the child's physical capacity, the child's energy should be conserved during acute phases of illness. **4** This is not necessary; the child with cystic fibrosis can eat regular meals at the usual times.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Cystic Fibrosis, Nursing Care

**196. 3 This regimen will give the child an opportunity to rest before eating.**

**1** The child should be encouraged to cough; if it is not effective, suctioning can be done after chest percussion and postural drainage. **2** Chest percussion and drainage should be done after aerosol therapy. **4** This may cause the child to vomit.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Planning/Implementation; **Reference:** Ch 31, Cystic Fibrosis, Nursing Care

**197. 3 Cystic fibrosis is characterized by an overproduction of viscous mucus by exocrine glands in the lungs. The mucus traps bacteria and foreign debris that adhere to the lining and cannot be expelled by the cilia, thus obstructing the airway and favoring growth of microorganisms and infection.**

**1** Cardiac defects are not associated with cystic fibrosis. **2** Neuromuscular irritability of the bronchi does not occur in cystic fibrosis. **4** Although there is increased sodium and chloride in the saliva, these do not irritate or inflame the mucous membranes.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Cystic Fibrosis, Data Base

**198. 1 Because children with cystic fibrosis do not absorb the fat-soluble vitamins effectively, they should be given in a water-miscible form.**

**2** These vitamins can be given with other vitamins once a day; pancreatic enzymes are administered with meals and snacks. **3** The nurse does not have to calibrate a dose of these vitamins based on the child's height and weight. **4** There is no reason to select juice over milk when administering these vitamins.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Cystic Fibrosis, Data Base

**199. Answer: 2, 4, 5.**

**1** Steroids are not indicated in the treatment of cystic fibrosis. **2** Antibiotics are prescribed to treat recurrent respiratory tract infections. **3** Antihistamines are not used because of the drying effect on the already tenacious mucus secretions. **4** Thick secretions obstruct the pancreatic ducts, and essential pancreatic enzymes are blocked from reaching the duodenum; therefore, pancreatic enzymes are administered with meals to assist with digestion. **5** Fat-soluble vitamins are necessary secondary to the decreased absorption of fat.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Cystic Fibrosis, Nursing Care

**200. 1 Pinworms emerge nocturnally to lay eggs in the perianal area; eggs are transferred onto transparent tape in the morning before toileting.**

**2** A culture will not reveal the presence of parasites. **3** Ova cannot be seen with the naked eye; the parasite is rarely observed in the stool. **4** This is not a test to diagnose pinworms.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Pinworms, Data Base

**201. 4 The adult pinworm lives in the rectum or colon and emerges onto the perirectal skin during the hours of sleep, depositing its eggs during this time.**

**1, 2, 3** Pinworms attach to the bowel wall and do not emerge from the rectum at this time.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

**202. 4 Pinworms attach to the bowel wall in the cecum and appendix and can damage the mucosa, causing appendicitis.**

**1** Pinworms do not migrate to the liver. **2** Although pinworms (and their ova) are ingested by mouth, they do not attach there; inflammation of the mouth is not a complication of pinworm infestation. **3** Pinworms do not migrate to the respiratory system.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Assessment/Analysis; **Reference:** Ch 31, Pinworms, Data Base

**203. 4 All household members should be treated at the same time unless they are younger than 2 years of age or pregnant.**

**1** This drug is not recommended for children under the age of 2 years. **2** This is not a significant criterion for administration of medication because the eggs are airborne. **3** Positive testing is not a criterion for administration to family members.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Pinworms, Nursing Care

**204. 4 This is the expected response because the medication causes death of the worms.**

**1** Neither the drug nor the worms cause intestinal bleeding. **2** Transient diarrhea, not constipation, may occur. **3** The medication can color the stool red, not yellow.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes;

**Reference:** Ch 31, Pinworms, Nursing Care

**205. 1 As the mite burrows into skin folds (e.g., interdigital, axillary, inguinal), it creates threadlike burrows that are intensely pruritic.**

**2** Grayish white particles adhering to hair shafts are nits, an indicator of pediculosis capitis, not scabies. **3** This is not an indicator of scabies; the bite of a brown recluse spider causes a lesion that progresses to necrotic ulceration in 7 to 14 days. **4** Reddened areas of alopecia are consistent with ringworm, not scabies.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

**Planning/Implementation; Reference:** Ch. 33, Scabies, Data Base

**206. 2 A potty chair allows the child to display its contents with pride; sitting on top of a toilet seat is frightening for many children. Potty chairs also allow the child to place feet on the floor for an effective Valsalva maneuver for bowel evacuation.**

**1** Sitting on a toilet seat can be frightening for a toddler; timing of bowel training should coincide with the gastrocolic reflex. **3** Bowel training should begin when the child shows readiness. **4** A diet consisting mainly of solid foods will make stools more bulky and easier to control.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 31, Growth and Development, Major Learning Events

**207. 3 Dehydration promotes the sickling of erythrocytes. Increased fluid intake minimizes the chance that a sickle cell pain episode will reoccur.**

**1** This is not necessary or helpful for a child with sickle cell anemia. **2** Rigorous exercise is contraindicated because the decrease in oxygenation may cause sickling. **4** This is not necessary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Sickle Cell Anemia, Nursing Care

**208. 1 The child is having an allergic reaction, and the infusion must be stopped immediately to prevent serious complications.**

**2** Slowing the rate of infusion will not halt the allergic reaction to the transfused blood. **3** This is dangerous as an initial action because the degree of allergic reaction cannot be determined at this time. Also, it requires a health care provider's prescription. **4** The health care provider should be notified after the infusion has been stopped.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31,  $\beta$ -Thalassemia, Nursing Care

**209. 3 Folic acid acts as a necessary coenzyme in the formation of heme, the iron-containing protein in hemoglobin.**

**1** Calcium is not involved in the production of RBCs. **2** Thiamine is a coenzyme in carbohydrate metabolism. **4** Riboflavin is a control agent for energy production and tissue formation.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Knowledge; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Iron Deficiency Anemia, Nursing Care

**210. Answer: 1, 3.**

**1** Protein is essential for the synthesis of the blood proteins, albumin, fibrinogen, and hemoglobin. **2** Calcium is not involved in the synthesis of red blood cells. **3** Vitamin C (ascorbic acid) influences the removal of iron from ferritin (making more iron available for the production of heme) and influences the conversion of folic acid to folinic acid. **4** Vitamin D is not involved in the synthesis of red blood cells. **5** Carbohydrates are not involved in the synthesis of red blood cells.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Iron Deficiency Anemia, Nursing Care

**211. 3 A diet of only milk is not sufficient to meet the infant's iron needs. Meat and fortified cereals are high in iron. Finger foods are appropriate for older infants.**

**1** At this age weaning from the bottle is not the issue; supplementary iron intake is. **2** Although health care and monitoring will be required, the metabolic clinic is not the appropriate referral. **4** Although this will increase iron intake, it is not appropriate for a 1-year-old infant, nor is it desirable.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Iron Deficiency Anemia, Nursing Care

**212. 1  $\beta$ -Thalassemia is common in children who are black or of Mediterranean descent**

(Italian, Greek, Syrian); an enlarged abdomen may be due to hepatomegaly or splenomegaly.

**2** Pale skin is expected in children of Irish descent; children with  $\beta$ -Thalassemia may have a bronze skin color from hemosiderosis if not chelated. **3** Defective hemoglobin leads to damaged RBCs and a decreased hematocrit. **4** Asian descent is not a risk factor for  $\beta$ -Thalassemia.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch. 31,  $\beta$ -Thalassemia, Nursing Care

**213. 3 Children with a chronic illness, such as hemolytic anemia, should not be exposed to the additional stress of infection.**

**1** A regular intake of fluid is recommended. **2** Activity is not restricted, although the child may self-restrict activity because of anemia-induced fatigue. **4** Regular meals with the family should be encouraged.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31,  $\beta$ -Thalassemia, Nursing Care

**214. 2 In this type of episode there is a pooling of blood in the liver and spleen, with a decreased circulating blood volume and subsequent shock.**

**1** These are the characteristics of a vaso-occlusive crisis. **3** Decreased RBC production and the profound anemia that ensues are characteristics of aplastic crisis. **4** Increased RBC destruction and a concomitant anemia, jaundice, and reticulocytosis are characteristics of hyperhemolytic crisis.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 31, Sickle Cell Anemia, Data Base

**215. 1 Dehydration, stress, infection, and electrolyte imbalance can cause the sickling process. Red blood cells change to the sickle shape when deoxygenated because of polymerization of the abnormal hemoglobin. This process damages the RBC membrane, which causes the cells to become entangled in the blood vessels. This deprives the tissues that are distal to the occlusion of oxygen, resulting in ischemia and infarction, which can result in organ damage.**

**2** The child's condition determines the activity level; although bed rest may be required during a pain episode, at other times it is rarely necessary. **3** This will not prevent thrombus formation. **4** Anticoagulants do not help prevent thrombus formation in sickle cell anemia.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 31, Sickle Cell Anemia, Nursing Care

**216. 4 Cardiac decompensation results because the heart attempts to maintain tissue oxygenation by increasing its workload.**

**1** Shock occurs with hemorrhage because the body does not have time to adapt to the sudden loss of blood. With chronic anemia, compensatory mechanisms take over. **2** An elevated WBC count indicates that there is an infection; however, the data do not

indicate the presence of an infection. **3** Hemoglobin in the urine suggests hemolytic anemia. Although it is important to assess for the cause of the anemia, it is not the priority.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Iron Deficiency Anemia, Data Base

**217. 2 Warmth causes vasodilation, which will lessen the pain of the vaso-occlusive crisis.**

**1** Cold will cause more vasoconstriction and increase pain. **3** This is an inadequate dose for an adolescent. **4** IV fluids should be increased to dilute the blood and prevent further sickling.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Sickle Cell Anemia, Nursing Care

**218. 2 Children with both illnesses have inadequate resistance to infection. Sickling results from low oxygen levels; celiac crisis results from malnourishment and immunologic defects.**

**1** Activity need not be limited in celiac disease; strenuous activity should be limited in sickle cell anemia. **3** This is important for children with celiac disease; it is not necessary for children with sickle cell anemia. **4** This diet is not particularly helpful for children with sickle cell anemia or celiac disease.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Sickle Cell Anemia, Nursing Care

**219. Answer: 2, 3.**

**1** Although nutrition is important, it is not a major concern during a crisis. **2** Hydration is necessary to promote and maintain hemodilution. **3** Pain in the area of involvement is a major problem and demands priority care. **4** Although important for these children, during a crisis prevention of infection is not the major concern. **5** Oxygen may be helpful to prevent further sickling, but it is not effective in reversing sickling because it cannot penetrate the sickled RBCs in the clogged blood vessels

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 31, Sickle Cell Anemia, Nursing Care

# Nursing Care of Preschoolers

**220. 2 The child will self-move the hand over the abdomen; the nurse can then engage the child's cooperation and do a general assessment.**

**1** Further assessment is necessary; it should be determined whether the crying is due to pain or fear. **3** The parents may hold, but not restrain, the child, because this may increase anxiety. **4** This is not an initial intervention; the child's cooperation will be needed for this procedure.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**221. 3 Preschoolers generally have learned to cope with parents' absence; however, emotions associated with separation are difficult to hide when parents arrive or leave. Anger at being left also may account for the emotional outburst.**

**1** Preschoolers enjoy social interaction and probably will be cooperative. **2** Preschoolers have learned to cope with their parents' absence. **4** Preschoolers have developed social skills with peers and will be able to interact with them even when the other children's parents are present.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**222. 4 Referring the parent back to the health care provider with a suggestion that addresses the need for more information is an appropriate initial intervention. The health care provider can coordinate the referral to the appropriate specialists (e.g., oncologist, hematologist).**

**1** Although this is a true statement, it minimizes the parent's concern. **2** Although this may be done eventually, it does not address the parent's need for information. **3** The Leukemia Society may disseminate information, but it does not give advice on a personal level. This referral may be done eventually.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**223. 1 Children with nephrotic syndrome are treated with immunosuppressive agents, including steroids. During exacerbations they may have a characteristic pale, overweight appearance from edema. Steroid side effects include growth retardation, cataracts, obesity, and hirsutism. Children may become very sensitive about these changes as they grow older.**

**2** Although this may be indicated, body-image problems pose a greater threat. **3** Engaging in usual childhood activities between attacks should promote the development of fine muscle coordination. **4** Sterility is not associated with nephrotic syndrome.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Nephrotic

**224. 4 A classic sign of nephrotic syndrome is gross proteinuria; a decrease indicates that treatment is successful.**

**1** A child with nephrotic syndrome has gross edema and oliguria; increased urine output is the desired outcome. **2** Children with glomerulonephritis have hematuria; it is not expected in children with nephrotic syndrome. **3** Children with diabetes mellitus have glycosuria; it is not expected in children with nephrotic syndrome.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 32, Nephrotic Syndrome, Data Base

**225. 3 This focuses on the child's feelings and a familiar object of security.**

**1** The child may experience pain as part of the treatment, so the statement is untruthful.

**2, 4** Diverting the child's attention will not alleviate fear and anxiety.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Hospitalization of Preschoolers, General Nursing Care of Preschoolers

**226. 2 Fear of mutilation is typical of the preschooler because they have vague views of body boundaries.**

**1** Toddlers are more likely to fear separation from parents. **3** Preschoolers do not view death as final. **4** Although preschoolers do indulge in magical thinking, they have not yet developed the concept of supernatural beliefs.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**227. 2 The anxiety that occurs in a 4-year-old child regarding invasive procedures will be lessened when the child holds the scope and realizes how it will be used.**

**1** This is suggesting an unsafe activity. **3** This request will more likely be accepted after the child has handled the scope and recognizes what to expect. **4** Stating the word "hurt" may increase anxiety; a 4-year-old child thinks in concrete terms and probably will not believe the nurse until experiencing the procedure.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**228. 3 A few minutes will be enough time for the child to begin self-feeding. The nurse should provide both physical and emotional support because the child's request for help indicates regression and the need for dependence during a period of stress.**

**1** This does not provide the child with the help that may be needed. **2** It may be a while until the child feels better; in the meantime, adequate nourishment to provide for healing is needed. **4** This can cause stress, feelings of guilt, and embarrassment to a sick child.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**229. 1 The child may be fearful of the examining room experience. If the nurse greets the**

**child while in the safety of the waiting room, it might help to make the experience less threatening.**

**2** Calling the child without entering the room is an authoritarian approach that will not limit the child's anxiety. **3** Having someone else bring the child into the examining room is an authoritarian approach that may make the child more fearful. **4** Standing at the examining room door while the child walks down the hall is an authoritarian approach that may increase the child's anxiety.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Hospitalization of Preschoolers, General Nursing Care of Preschoolers

**230. 1 PredniSONE reduces the child's resistance to certain infectious processes. Also predniSONE is an antiinflammatory drug that masks infection.**

**2** The child will self-limit activity based on the respiratory status. **3** Eosinophil counts are often consistently elevated in children with asthma. **4** The child will need adequate hydration to assist with loosening and removing mucus.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Asthma, Nursing Care

**231. 4 Euphoria and mood swings may result from steroid therapy.**

**1** Alopecia does not result from steroid therapy. **2** An increased appetite, not anorexia, results from steroid therapy. **3** Weight gain, not weight loss, results from steroid therapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 32, Leukemia, Nursing Care

**232. 1 PredniSONE is a synthetic glucocorticoid that has an active antiinflammatory effect by stabilizing lysosomal membranes and thus inhibiting proteolytic enzyme release.**

**2** PredniSONE does not affect the lymphocytes. **3** Although predniSONE increases the appetite and creates a sense of well-being, these are not the reasons it is administered. **4** There is no indication the child is receiving radiation.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Leukemia, Data Base

**233. Answer: 44 pounds. The child's daily dose is 40 mg (10 mg  $\times$  4 times a day). Divide the daily dose of 40 mg by 2 mg/kg/day, which equals 20 kg. Since 1 kg is equal to 2.2 lb, multiply 20  $\times$  2.2, which equals 44 lb.**

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

**234. 4 VinCRISTine is highly neurotoxic, causing paresthesias, muscle weakness, ptosis, diplopia, paralytic ileus, vocal cord paralysis, and loss of deep tendon reflexes.**

**1** Hematologic effects are rare. **2** Alopecia is reversible with cessation of the drug. **3** There are no severe gastrointestinal effects.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 32, Leukemia, Nursing Care

**235. 1 Children with leukemia most often die of infection; a low neutrophil count is associated with myelosuppressant therapy.**

**2** These measures are not appropriate to prevent infection resulting from neutropenia; they are appropriate for treating the anemia. **3** These measures are not appropriate to prevent infection resulting from neutropenia; they are more appropriate for preventing bleeding. **4** These measures are not appropriate to prevent infection resulting from neutropenia; they are used to treat stomatitis.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Leukemia, Nursing Care

**236. 1 The child from 1 to 4 years of age is learning to use the body and manipulate and experiment with all aspects of the environment; these abilities may challenge the nursing assistant, especially when taking vital signs.**

**2** The school-age child is able to cooperate and understand when receiving care; however, modesty should be respected. **3** From 6 to 12 months of age, it usually is helpful while giving care to have the infant held on the parent's lap to limit stranger anxiety or to allow the parent to provide basic care (e.g., changing diapers, bathing). **4** Infants usually are not a challenge to care for. The infant usually is easily distracted with sounds and smiles.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**237. 3 Role-playing encourages expression of concerns through behavior, since children's ability to verbalize feelings is limited.**

**1** The preschooler is too young to think about careers. **2** This may occur, but it is not a purpose of role-playing. **4** Although preschoolers try to imitate adults, providing guidelines for adult behavior is premature.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Health Promotion of Preschoolers Play

**238. 4 It is common for 4-year-old children to boast and exaggerate and to be impatient, noisy, and selfish.**

**1** More advanced, cooperative play is expected of 4-year-old children. **2** This is unusual for 4-year-old children, since they are striving toward more initiative and less dependence. **3** The toddler's tendency toward tantrums and negativism should have waned by 4 years of age.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Health Promotion of Preschoolers Play

**239. 3 Most 4-year-old children are imaginative; because the line between fantasy and reality is blurred, imaginary playmates are common at this age. Generally, they are given up when the child starts school.**

**1** This assumption is not relevant at this age; it becomes a concern when the child reaches school age. **2, 4** This response may cause unnecessary concern; it provides false

information.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 32, Health Promotion of Preschoolers, Play

**240. 2 Fear of mutilation and intrusive procedures is most common at this age because of fantasies and active imagination. These children also connect illness with being bad and view intrusion as punishment.**

**1** Death is seen as reversible and not final. **3** A child this age usually has little previous contact with pain and therefore little experience on which to base fear. **4** Fear of isolation from peers is a problem for school-age children and adolescents.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension;

**Integrated Process:** Caring; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**241. 1 Because their ability to express feelings verbally is limited, preschool children act out their feelings via play.**

**2** Acceptance of hospitalization will not occur until the child has coped with fears. **3** The child needs to cope with feelings rather than forget them. **4** Therapeutic play does not necessarily involve other children.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Hospitalization of Preschoolers, General Nursing Care of Preschoolers

**242. 1 Nonstrenuous, diversional activities involving interpersonal relationships with another person provide better support and resting conditions than does more active play.**

**2** A jigsaw puzzle is too complicated for a 5-year-old child and does not provide the human contact needed. **3, 4** Although this is an age-appropriate distraction, it does not provide the human contact needed.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Hospitalization of Preschoolers, General Nursing Care of Preschoolers

**243. 4 Gas exchange is limited because of narrowing and swelling of the bronchi; the carbon dioxide level increases.**

**1** The oxygen level will be decreased, not increased. **2** The pH will decrease; the child is in respiratory acidosis, not alkalosis. **3** The bicarbonate level will be increased to compensate for acidosis.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Asthma, Data Base

**244. 4 Cold and exercise can precipitate bronchospasm, and increased exercise depletes oxygen.**

**1** Treatment of asthma does not involve a low-fat diet. **2** Asthma is a chronic condition. Return to usual activities after the acute stage is essential for growth and development. **3** Although increased protein and calories may be needed to support the child during a coexisting bacterial infection in the acute stage, a return to usual eating

habits is indicated by the time of discharge.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 32, Asthma, Nursing Care

245. **Answer: 1, 4.**

**1** Parents should be taught to limit allergens in the home that can precipitate asthma attacks (e.g., no carpets, no down pillows, wet-mop floors, vacuum when the child is not in the home, no scented household products). **2** Environmental moisture is necessary for these children; in addition, cold environments should be avoided. **3** Consistent limits should be placed on the child's behavior regardless of the illness; a chronic illness does not eliminate the need for limit setting. **4** Medications to control inflammation, including inhaled corticosteroids and long-acting beta 2-agonists, must be continued to suppress exacerbations of asthma. **5** The child should return to school and continue to interact with schoolmates and friends.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 32, Asthma, Nursing Care

246. **Answer: 3, 4.**

**1** An elevated temperature is a characteristic of sepsis, not asthma. **2** Crackles are associated with pulmonary edema, not asthma. **3** Bronchial constriction with mucus production causes wheezing. **4** With the decrease in arterial oxygenation associated with asthma, the heart rate will increase. **5** Hypertension, not hypotension, may occur with asthma.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Asthma, Data Base

247. **3 The restricted ventilation accompanying an asthma attack limits the body's ability to blow off carbon dioxide. As carbon dioxide accumulates in the body fluids, it reacts with water to produce carbonic acid; the result is respiratory acidosis.**

**1** The problem basic to asthma is respiratory, not metabolic. **2** Respiratory alkalosis is caused by exhaling large amounts of carbon dioxide; asthma attacks cause carbon dioxide retention. **4** Asthma is a respiratory problem, not a metabolic one; metabolic acidosis can result from an increase of nonvolatile acids or a loss of base bicarbonate.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 32, Asthma, Data Base

248. **3 The seepage of blood from the operative site drains into the oral cavity, causing the child to swallow.**

**1** Snoring can be expected after a tonsillectomy because of edema. **2** Because the child has been NPO for an extended time and is not able to swallow fluids easily, the child will probably ask for fluids. **4** This may be a later sign of hemorrhage.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 32, Tonsillectomy and Adenoidectomy, Nursing Care

249. **1 Ice chips are soothing and promote vasoconstriction.**

**2** Milk and milk products coat the mouth, causing the child to clear the throat, which may

precipitate bleeding. **3** The supine position promotes edema and does not allow oral secretions to drain from the mouth. The head of the bed should be elevated, and the child should be positioned on the side. **4** Mouthwash solution is too caustic; a warm saltwater solution is preferred.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 32, Tonsillectomy and Adenoidectomy, Nursing Care

**250. 1** The characteristic “strawberry tongue” is due to sloughing of the normal coating of the tongue, leaving the papillae exposed.

**2** There is bilateral congestion of the ocular conjunctiva without an exudate. **3** The fever associated with Kawasaki disease is high and has an abrupt onset; it is unresponsive to antibiotics and antipyretics. **4** A maculopapular rash on the extremities does not occur; peripheral edema and erythema occur with desquamation of the palms of the hands and soles of the feet.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 32, Mucocutaneous Lymph Node Syndrome, Data Base

**251. 3** Infection is a constant threat because of a poor general state of nutrition, a tendency toward skin breakdown in edematous areas, corticosteroid therapy, and lowered immunoglobulin levels.

**1** Although intake of foods with high nutritional value should be encouraged, this is not the priority. **2** Fluid monitoring is important in determining whether a fluid restriction is indicated. **4** Bed rest may be needed for severe edema, but ambulation is preferred.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 32, Nephrotic Syndrome, Nursing Care

**252. 1** Poor appetite and decreased energy are associated with the accumulation of toxic waste; anemia accounts for the pallor.

**2** Activity does not cause these signs and symptoms. **3** An elevated temperature probably will be present, but an infection will not cause a muddy pallor. **4** Discontinuing the corticosteroids and diuretics that usually are prescribed will probably result in recurrence of edema in steroid-dependent children.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 32, Nephrotic Syndrome, Nursing Care

**253. 3** A renal biopsy is an invasive procedure. In the early stages, Wilms tumor is encapsulated. Any disruption of the tumor capsule may precipitate metastasis.

**1** An MRI is helpful in making the diagnosis. **2** A CT scan is helpful in making the diagnosis. **4** An abdominal ultrasound is helpful in making the diagnosis.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 32, Wilms Tumor, Nursing Care

**254. Answer: 1, 2.**

**1** There is an increase in appetite that results in deposition of fat on the abdomen and

trunk. **2** Muscle wasting results in thin extremities. **3** Increased excretion of calcium causes a retarded linear growth with a short stature. **4** Because of the excess production of androgens, virilization and hirsutism occur. **5** Increased salt and water retention cause hypertension and hypernatremia.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;

**Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 32, Nephrotic Syndrome, Nursing Care

**255. 1 Comparison of daily weights is the most accurate way to assess fluid retention or loss.**

**2** This is difficult for a child this age and will not be accurate. **3** This is a measure for the degree of ascites; it indirectly measures fluid retention. **4** Assessment of urine for protein gives information about the disease process but not about the amount of fluid retention.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 32, Nephrotic Syndrome, Nursing Care

**256. Answer: 1, 2, 4.**

**1** Pallor is the result of anemia associated with leukemia. **2** Fatigue is the result of anemia associated with leukemia. **3** Jaundice usually indicates liver damage or excessive hemolysis and is not an early sign of leukemia. **4** Multiple bruises are the result of thrombocytopenia associated with leukemia. **5** Edema is not a manifestation of the disease because the pathophysiology does not involve transport of fluids.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 32, Leukemia, Data Base

**257. 2 Because of the increased capillary fragility and decreased platelet count that accompany leukemia, even the slightest trauma can cause hemorrhage. Brushing the teeth has caused gingival bleeding, and the incident should be documented; this information may also assist in defining the treatment plan.**

**1** It is wiser to eliminate a toothbrush and use a sponge-type applicator. **3** It cannot be assumed that a 4-year-old child will or can follow such a direction. **4** This can irritate the gums, causing more trauma. If oral ulcers develop, the mouth should be rinsed with an isotonic solution such as normal saline.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Communication/Documentation; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 32, Leukemia, Nursing Care

**258. 4 Radiation is used to destroy leukemic cells in the brain because chemotherapeutic agents are inadequately absorbed through the blood-brain barrier.**

**1** Chemotherapy is required to treat the systemic leukemic process. **2** Radiation does not reduce the risk for infection. **3** Cranial radiation has no effect on the systemic leukemic process.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 32, Leukemia, Data Base

# Nursing Care of School-Age Children

259. **1 Regression is expected in times of stress. It is a transient need that should be accepted because it helps reduce anxiety.**

**2** Distraction works only as long as it is employed. **3** It is the nurse's responsibility to identify the child's response to hospitalization and address the child's needs at this time. **4** Cause (thumb-sucking) and future effect (buckteeth) will not be meaningful to a 6-year-old child; furthermore, thumb-sucking may or may not cause malocclusion.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;  
**Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Hospitalization of School-Age Children, General Nursing Care of School-Age Children

260. **2 The nurse is seeking clarification while encouraging each child to communicate verbally, rather than expressing their differences physically.**

**1** This is accusatory and nontherapeutic. **3** This is a threatening response. **4** This is not relevant; the nurse should be concerned with the present situation.  
**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;  
**Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Health Promotion of School-Age Children, Play

261. **1 The priority is to assess the throat to determine the extent of inflammation. Significant swelling can create the potential for airway obstruction.**

**2, 3, 4** Assessment of the child's problem must be done before initiating any other actions.  
**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

262. **4 According to Piaget's cognitive development theory, school-age children use concrete operational thinking; a general discussion in concrete terms will be understood and transferred to the actual situation.**

**1, 2** This requires conceptual thinking, which is just beginning to develop during the school-age years; 8-year-old children are not ready for this thought process. **3** These children are capable of understanding a concrete explanation; this request belittles them.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;  
**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 33, Growth and Development, Developmental Timetable

263. **Answer: 2, 5.**

**1** Hepatic side effects, such as jaundice, may occur but are not common. **2** Nausea and vomiting may occur due to gastrointestinal irritation. **3** CNS side effects, such as headache, are rare adverse reactions. **4** This is a rare side effect. **5** Hypersensitivity reactions such as skin rash, erythema, fever, and pruritus occur with much greater frequency in children and adults with AIDS.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 3, Infection, Related Pharmacology, Sulfonamides

**264. 4 The goiter associated with Hashimoto disease usually is transient and regresses spontaneously in 1 or 2 years. The child usually is euthyroid but may show signs of hypothyroidism or hyperthyroidism.**

**1** This is not a chronic disease. **2** This is not an untreatable or fatal disorder; it can be controlled with a medical regimen. **3** There seems to be a strong genetic predisposition, but no mode of inheritance has been identified.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 30, Hypothyroidism, Data Base

**265. 2 Allowing the child to participate in the procedure provides the child with some control over a frightening experience.**

**1** Offering medication and using the word “hurt” may increase anxiety. **3** Using the word “hurt” may increase anxiety. The child will be hypervigilant and will not follow the directions to close the eyes. **4** Distraction will be unsuccessful in this situation; the child is afraid, and a passive activity will be insufficient to reduce anxiety.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Hospitalization of School-Age Children, General Nursing Care of School-Age Children

**266. Answer: 1, 2, 3.**

**1** School-age children are creative and have the manipulative skills to color in coloring books. **2** School-age children enjoy collections, and many 6-year-old children collect small metal cars; it also supports imaginative play. **3** School-age children enjoy competition and have manipulative skills necessary to manipulate cards. **4** This is more appropriate for the toddler or preschooler, who is developing fine motor skills. **5** This activity is too passive and ignores the 6-year-old child’s developmental needs.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Health Promotion of School-Age Children, Play

**267. 4 Six-year-old children are aware of their hands as tools and enjoy building simple structures.**

**1** This is more appropriate for preschoolers. **2, 3** This is more useful for an older school-age child, who has a longer attention span and a better ability to follow instructions.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Health Promotion of School-Age Children, Play

**268. 4 The peripheral line must be used until the placement of the central venous line is confirmed by radiography or fluoroscopy; this prevents fluid from entering the lung or interstitial space if the catheter is misplaced.**

**1, 3** The central line should not be used until placement is confirmed. **2** Drugs and fluids

can be administered through central venous lines; most devices have multiple ports.  
**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Analysis;  
**Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

269. **Answer: 2, 3.**

**1** This is a solitary activity that will increase the child's boredom. **2** School-age children have an interest in hobbies or collections of various kinds as a means of gathering information and knowledge about the world in which they live. **3** School-age children are industrious, and making a model airplane is an appropriate age-related activity. **4** This will not interest the average 9-year-old child. **5** These probably will not interest a 9-year-old child.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Health Promotion of School-Age Children, Play

270. **1 The reserved student should be given the opportunity to interact with peers.**

**2** The class clown may not be able to accept the responsibility needed for a leadership role. **3** The child who has an established nurse-client relationship may have difficulty interacting with the nurse in a new role. **4** Although the outgoing child probably will be able to take on added responsibility, the child does not need help with social interaction.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Health Promotion of School-Age Children, Play

271. **4 Because young children have difficulty verbalizing their fears or anxiety, therapeutic play helps them express these feelings.**

**1** A child this age is unable to express feelings entirely through words. **2** This may be helpful for a toddler or preschooler; school-age children need to act out their fears. **3** Young school-age children are still somewhat egocentric and therefore interested in their own experiences and sensations.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Hospitalization of School-Age Children, General Nursing Care of School-Age Children

272. **2 Eight-year-old children are beginning to achieve a sense of industry and accomplishment. They are in Piaget's stage of concrete operations wherein they are able to use their thought processes to experience actions. Their growing independence enables them to make decisions based on what they have learned.**

**1** Six-year-old children are just beginning to experience the developmental goals of the school-age child. They are not ready to make choices based upon what they have learned. **3** Preadolescents are beginning to assert their independence and probably will rebel if taught what they should eat. **4** Adolescents need to conform to their peer group. What is learned in a nutrition class probably will be ignored in favor of preestablished preferences.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 33, Growth and Development, Developmental Timetable

**273. 4 Studies have shown that culture and family eating habits have an impact on a child's eating habits.**

**1** Inheritance is not known to influence eating habits, although it is believed that there may be hereditary factors associated with obesity. **2** Childhood obesity is a known predictor of adult obesity. **3** Although there is a trend toward this, with intervention it can be prevented.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 33, Obesity, Nursing Care

**274. 3 There may be a weight gain caused by the influence of hormones before the growth spurt. Most 10- to 12-year-old children can eat an adult-size meal without becoming obese, especially if they are active.**

**1** Before advising increased activity, the nurse should assess the child's present activity level. **2** An adequate caloric intake is needed for the growth spurt that will occur during adolescence. **4** Family eating patterns appear to have more effect on weight than do genetics.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 33, Growth and Development, Developmental Timetable

**275. 3 School-age children lose their primary teeth, which may be aspirated during surgery. Special precautions must be taken to maintain safety.**

**1** This is a comforting gesture, but it is not essential. **2** There is no reason to obtain an antistreptolysin O (ASO) titer or a C-reactive protein level. **4** This is important but not always possible.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated**

**Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 33, Hospitalization of School-Age Children, General Nursing Care of School-Age Children

**276. 4 To maintain the desired blood level, the medication must be administered in the exact amount at the times directed. If the blood level of the drug falls, the microorganisms have an opportunity to build resistance to the drug.**

**1** Weighing is important with drugs that affect fluid balance. **2** Sulfa medications should be given on an empty stomach to promote absorption. **3** Monitoring the temperature is important with antipyretic drugs.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to

Medications for Children, Nursing Care

**277. Answer: 1, 2, 3, 4, 5.**

**1** The inflammatory process in the kidney allows red blood cells to enter the urine, which manifests as hematuria. **2** Capillary permeability in the kidney allows protein to pass into the urine. **3** The glomerular filtration rate is reduced, resulting in sodium retention; fluid accumulation is evidenced by periorbital edema in the morning, which

spreads to the rest of the body as the day progresses. **4** When the glomerular filtration rate is reduced, fluid is retained as evidenced by a decreased urinary output; with a decreased urinary output the specific gravity will increase (1.030). **5** The retention of fluid causes an increase in the intravascular volume, resulting in an increased blood pressure.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Data Base

**278. 3 During the acute stage, anorexia and general malaise lower the child's resistance to infection.**

**1** A bland diet is not necessary, but high-protein and high-sodium foods should be avoided. **2** Bed rest is not a necessary restriction. It is encouraged when the child is easily fatigued. **4** Antibiotics are not necessary for all children with acute glomerulonephritis, only those with persistent streptococcal infections. The intramuscular route is not used.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Nursing Care

**279. 4 When urinary findings are within the expected range (e.g., no hematuria or proteinuria), the child may resume preillness activities.**

**1, 2** This restriction is unnecessary. **3** Bed rest is unnecessary.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Nursing Care

**280. 1 The use of aspirin to treat the fever associated with influenza is contraindicated; it is associated with Reye syndrome, a syndrome that involves a toxic encephalopathy and hepatic dysfunction.**

**2** Inactivated influenza viral vaccines are effective in prevention of influenza. **3** Fever may lead to dehydration; fluids help maintain hydration. **4** The influenza virus can be spread by direct contact or contact with surfaces contaminated with the virus; staying home prevents the spread of the disease to other students.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcome; **Reference:** Ch. 33, Reye Syndrome, Nursing Care

**281. 1 Daily changes in weight are indicators of fluid changes; loss or gain of muscle and fat does not cause daily fluctuations in weight.**

**2** Protein molecules do not weigh enough to be reflected in the child's weight on a daily basis. **3** When fluid weight gain, not loss, stops, the disease is being controlled. **4** It is not beneficial to plan the child's daily caloric intake on fluid weight loss or gain.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Nursing Care

**282. 2 The child has an elevated blood pressure that can cause hypertensive**

**encephalopathy, resulting in hyperperfusion of the brain and cerebral edema; one of the early signs of encephalopathy is a severe headache.**

**1** Rapid respirations do not cause a severe headache. **3** Anemia does not cause a severe headache. **4** The autoimmune response associated with APSGN is not the cause of the severe headache.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Data Base

**283. 1 A physical therapist can prescribe an exercise protocol to keep the joints as mobile as possible; a routine can be developed to help the child alleviate morning stiffness.**

**2** Although this might be necessary in the future, there is no evidence that it is needed at this time. **3** Although nutrition is an appropriate part of therapy, it is the physical therapy program that can most directly influence movement. **4** Over-the-counter medications should not be used without the supervision of a health care provider.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Juvenile Idiopathic Arthritis, Nursing Care

**284. 3 Hematuria may result from the use of nonsteroidal antiinflammatory drugs (NSAIDs) because they may cause nephrotoxicity.**

**1** This can occur but is not a sign of toxicity. **2** This does not occur with NSAIDs. **4** Drowsiness, not hyperactivity, may occur.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 33, Juvenile Idiopathic Arthritis, Nursing Care

**285. Answer: 1, 2, 4.**

**1** This helps maintain joint mobility while not creating weight-bearing on the joints. **2** This promotes functional movement. It is a low-impact activity compared to most outdoor activities that may employ running or jumping. **3** Prolonged sitting or lying in one position can lead to stiffness and flexion contractures. **4** This helps maintain muscle tone while providing freedom of movement without weight-bearing on the joints. **5** Prolonged sitting in one position can lead to stiffness and flexion contractures.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Juvenile Idiopathic Arthritis, Nursing Care

**286. 2 The exercises are done to preserve joint function.**

**1** Exercises do not necessarily relieve pain. **3** Circulation is not affected by the arthritic process. **4** Exercising does not affect the subcutaneous nodules.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Evaluation/Outcomes; **Reference:** Ch 33, Juvenile Idiopathic Arthritis, Nursing Care

**287. 1 Preadolescence is a critical period of growth, and steroids could lead to growth retardation.**

**2** The effect of steroids on sexuality is unclear. **3** Although mood changes have been

documented, this is not the reason why steroids are avoided during preadolescence. **4** Impaired body image is a result of many variables, not just medications.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:**

Assessment/Analysis; **Reference:** Ch 33, Juvenile Idiopathic Arthritis, Data Base

**288. 1 Teaching methods in each age group are different depending on the children's cognitive ability; individual differences depend on a variety of factors, including intelligence and emotional status. The child's readiness to learn must be assessed before developing a teaching plan that will bring success.**

**2, 3, 4** This will be important later, but not initially.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 29, Growth and Development of the Child, Principles of Growth

**289. 1 Helping families understand their feelings about diabetes is essential in assisting them to develop positive attitudes; these attitudes will motivate them to achieve optimal control of the disease and promote a healthy lifestyle for the child.**

**2** The child should participate in age-appropriate activities; adequate exercise is an important part of the treatment regimen for children who have diabetes. **3** This is important; however, if feelings are not addressed first, compliance with glucose monitoring is less likely. Also, the age and developmental level of the child must be considered before teaching can begin. **4** This is important; however, if feelings are not addressed first, compliance with insulin administration is less likely. Also, the age and developmental level of the child must be considered before teaching can begin.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Diabetes Mellitus, Nursing Care

**290. 2 Novolin N is an intermediate acting insulin; its peak action is 4 to 12 hours.**

**1, 4** The peak action of Novolin N insulin is 4 to 12 hours; this is too late. **3** This is the peak time for regular insulin, not Novolin N insulin.

**Client Need:** Pharmacological and Parenteral Therapies; **Integrated Process;**

Teaching/Learning; **Cognitive Level:** Comprehension; **Nursing Process:**

Evaluation/Outcomes; **Reference:** Ch 33, Diabetes Mellitus, Nursing Care

**291. 4 A bedtime snack is needed for the evening. Novolin N insulin is intermediate-acting insulin, which peaks 4 to 12 hours later and lasts for 18 to 24 hours. Protein and carbohydrate ingestion before sleep prevents hypoglycemia during the night when the Novolin N is still active.**

**1** The snack is important for diet/insulin balance during the night, not encouragement. **2** There are no data to indicate such a need; a bedtime snack is routinely provided to help cover intermediate-acting insulin during sleep. **3** The snack must contain mainly protein-rich foods, not simple carbohydrates, to help cover the intermediate-acting insulin during sleep.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Assessment/Analysis; **Reference:** Ch 33, Diabetes Mellitus, Nursing Care

**292. 3 An 8-year-old child is in the stage of industry vs inferiority and strives to complete assigned tasks.**

**1** This is true of an older child (adolescent). **2** Peer influences increase as the child enters the preadolescent and adolescent years. **4** This stage occurs during adolescence.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Assessment/Analysis;

**Reference:** Ch 33, Growth and Development, Developmental Timetable

**293. 3 An adolescent with type 1 diabetes must carry a source of simple sugar (e.g., glucose tablets, Insta-Glucose, sugar-containing candy such as Life Savers) to rapidly counteract the effects of hypoglycemia. This should be followed by a complex carbohydrate and a protein.**

**1** This is an unrealistic and unnatural pattern for an adolescent. **2** This is an unnecessary and time-consuming procedure. **4** The adolescent should be made to feel a part of the family; the recommended diet is nutritious and no different from that of the rest of the family. The timing of when food is eaten in relation to insulin administration is important.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 33, Diabetes Mellitus, Nursing Care

**294. 4 A blood glucose level of 180 mg/dL is above the average range, and the prescribed rapid acting insulin, is needed.**

**1** Although exercise does decrease insulin requirements and does lower blood glucose levels, the immediate action of insulin is needed. **2** This action will not correct the problem; the blood glucose level is already known. **3** Food intake at this time will increase the level of blood glucose.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Diabetes Mellitus,

Nursing Care

**295. 2 The adolescent needs immediate and easily absorbable glucose, such as soda, and long-lasting complex carbohydrates and protein, which are supplied by the bun and hamburger.**

**1** This can be done after some glucose has been ingested; otherwise, the adolescent's hypoglycemia can become severe. **3** Extra insulin will further aggravate the problem. **4** This is unsafe; appropriate intervention is necessary.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Analysis; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 33, Diabetes Mellitus, Data Base

**296. 1 By increasing the caloric intake, thereby increasing the protein and carbohydrate intake, a hypoglycemic reaction caused by exercise is less likely to occur.**

**2** An oral hypoglycemic is an inappropriate treatment for individuals with type 1 diabetes. **3** This will not prevent a hypoglycemic reaction when the child exercises

more vigorously than usual. **4** This type of intake is less effective than other nutrients, such as protein, that are absorbed more slowly and provide a more consistent blood glucose level.

**Client Need:** Reduction of Risk Potential; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Diabetes Mellitus, Nursing Care

**297. 3 The white dots are nits, the eggs of head lice (*Pediculosis capitis*); they can be seen on the shaft of hair along the scalp line, behind the ears, and at the nape of the neck.**

**1** This is too vague; objective visualization will confirm the presence of nits. **2** Canine ear mites are not transferable to humans. **4** This is a sign of scabies, which is the *Sarcoptes scabiei* mite.

**Client Need:** Safety and Infection Control; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Pediculosis Capitis, Data Base

**298. 4 Rheumatic fever is an inflammatory disease involving the joints, heart, central nervous system (CNS), and subcutaneous tissue. It is thought to be an autoimmune process that causes connective tissue damage.**

**1** Tetanus is not caused by a streptococcal infection. **2** The disorder described is not influenza. **3** The disorder described is not scarlet fever.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 33, Rheumatic Fever, Data Base

**299. 2 The purpose of digoxin (Lanoxin) is to slow and strengthen the apical rate. The apical rate for a healthy child of 5 years is 70 to 110 beats/min. If the apical rate is slow, administration of the drug may lower the apical rate to an unsafe level. Many health care providers set individual parameters to be followed.**

**1** This rate is too far below that which necessitates withholding digoxin for children; it is the correct rate for withholding digoxin in adults. **3, 4** This is within the expected heart rate range of 5-year-old children and does not necessitate withholding digoxin.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Characteristics of Growth, Circulatory System

**300. 2 Factor VIII has a short half-life; therefore, prophylactic treatment involves administering the factor on the scheduled days in the morning so that the child will get the most benefit during the day when most active.**

**1** Prophylactic treatment is done on a scheduled basis to prevent a bleed from occurring. **3** Administering the drug at bedtime will limit its effectiveness, since bleeds are more common when the child is active. **4** This does not take into consideration the properties of the drug.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Hemophilia, Nursing Care

**301. 3 Factor VIII is the missing plasma component necessary to control bleeding in a**

**child with hemophilia A.**

**1, 4** Factor VIII, the missing component, is not provided by this blood derivative. **2** Although fresh frozen plasma does contain factor VIII, there is an insufficient amount in a plasma transfusion; a higher volume is required.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Knowledge;

**Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Hemophilia, Data Base

**302. 2 The hemophilia gene is carried on the X chromosome but is recessive. Therefore, the female is the carrier (an unaffected XO and an affected XH). If the male receives the affected XH (XHYO), the disorder is manifested.**

**1** Hemophilia is carried by the female; the Mendelian laws of inheritance are not sex-specific. **3** Hemophilia is a sex-linked recessive disorder. **4** Females only carry the trait; males usually are affected.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Comprehension; **Nursing**

**Process:** Planning/Implementation; **Reference:** Ch 33, Hemophilia, Data Base

**303. 3 Aspirin has an anticoagulant effect, and it may harm a child with bleeding problems; in addition, aspirin is contraindicated for all children because of its relationship to Reye syndrome.**

**1** This response does not answer the mother's question; it may cause the mother to feel defensive. **2** Aspirin is contraindicated because of its anticoagulant effect. **4** Acetaminophen cannot prevent bleeding episodes; it is an analgesic.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 33, Hemophilia, Nursing Care

**304. Answer: 1, 3, 5.**

**1** Children with Down syndrome have a broad nose with a depressed bridge (saddle nose). **2** Children with Down syndrome have broad, short, stubby hands and feet. **3** Children with Down syndrome have inner epicanthic folds and oblique palpebral fissures; they also have speckling of the iris (Brushfield spots). **4** Children with Down syndrome have hypotonic, not hypertonic, musculature. **5** Children with Down syndrome have a transverse palmar crease (simian crease) formed by fusion of the proximal and distal palmar creases.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Analysis; **Nursing Process:**

**Planning/Implementation; Reference:** Ch 30, Trisomy 21, Data Base

**305. 1 A wheelchair must be used when there is an order for non-weight-bearing activity; a transfer using the unaffected leg prevents weight-bearing on the affected leg.**

**2** Kneeling applies pressure to the acetabulum and is considered a weight-bearing activity; it is contraindicated. **3** Range-of-motion exercises are contraindicated; an abduction brace is to be used 23 hours a day; the other hour is for bathing and toileting. **4** Using a four-point gait with crutches equally distributes the weight-bearing to all four extremities.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated**

**Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:**

Ch 33, Legg-Calvé-Perthes Disease, Nursing Care

# Nursing Care of Adolescents

306. The ball of the oxygen flowmeter should be set at 8 to deliver 40% oxygen when using the Venturi mask.

**Client Need:** Physiological Adaptation; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

307. **4 The nurse made the assessment that the medication was ineffective in relieving the adolescent's pain for the duration prescribed. This information should be communicated to the health care provider for evaluation.**

**1** The prescription is for administration every 3 hours; legally it can be given only within these guidelines. **2** There are no data to support this; the amount of medication was probably inadequate for the adolescent's pain tolerance level. **3** The nurse should not ignore the adolescent's need for pain relief.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation;  
**Reference:** Ch 29, Age-Related Responses to Pain, Nursing Care Related to Pain Assessment

308. **Answer: 5 mL.** For a 500 mL bag, 10 mEq of potassium chloride is needed to equal a concentration of 20 mEq/L. Use the "Desired over Have" formula of ratio and proportion to solve this problem.

$$\frac{\text{Desired}}{\text{Have}} \frac{10 \text{ mg}}{2 \text{ mg}} = \frac{x \text{ mL}}{1 \text{ mL}}$$

$$2x = 10$$

$$x = 10 \div 2$$

$$x = 5 \text{ mL}$$

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 29, Principles Related to Medications for Children, Nursing Care

**309. 2 Anger interferes with communication; recognition and ventilation of anger help to resolve it and can help increase productive communication.**

**1** Anger is interfering with the acceptance of responsibility and must be addressed first. **3** They are too angry with each other to work this out alone; they may continue to express anger toward each other, which probably will escalate the conflict in their relationship. **4** The parent should be involved with the therapy and therefore must be present when treatment is discussed.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Analysis; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Hospitalization of Adolescents, General Nursing Care of Adolescents

**310. 3 The menarche occurs when the prepubertal growth spurt is almost completed and after the primary and secondary sexual characteristics are almost fully developed.**

**1** Pubic hair is apparent about 6 months after the breasts begin to develop and before menarche occurs. **2** The breasts are the first secondary sexual characteristics to develop early during the prepubertal growth and development period. **4** Although there may be a familial tendency to reach the menarche at the same age, there are too many variables to use this as a guideline.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Growth and Development, Developmental Timetable

**311. Answer: 75th percentile. Find the age of 13 along the horizontal scale at the bottom of the graph. Follow the line vertically up the graph to the student's BMI of 21. The two lines bifurcate on the line for the 75th percentile.**

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Nursing Process:** Planning/Implementation; **Reference:** Ch 33, Obesity, Nursing Care

312. **1 A side effect of vinCRISTine is alopecia. To adolescents, who are very concerned with identity, this represents a tremendous threat to their self-image.**

**2** Constipation, although very serious, is not as important to the adolescent as a side effect that affects appearance. **3** Although anorexia will be a concern while undergoing chemotherapy, it is not as important before the start of the regimen. **4** Although neurologic side effects are serious, they are not as important to the adolescent before the start of chemotherapy.

**Client Need:** Pharmacological and Parenteral Therapies; **Cognitive Level:** Application;

**Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation;

**Reference:** Ch 34, Bone Tumors, Nursing Care

313. **3 Several meetings with an adolescent provide an opportunity to develop trust and establish a relationship.**

**1** This is not necessary and may not help in establishing a relationship. **2** This is not realistic because the nurse is not the teenager's peer. **4** It is not necessary to

communicate in concrete terms because the average adolescent is past this cognitive level.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Hospitalization of Adolescents, General Nursing Care of Adolescents

**314. 3 The future seems far away; immediate gratification takes priority.**

**1** Adolescents are often confused about their feelings. **2** School-age children (7 to 11 years) use concrete operational reasoning; adolescents are learning to think in abstract terms and use formal operational reasoning. **4** This is the developmental stage of children 6 to 12 years of age; identity versus role confusion is the developmental stage of the adolescent.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 34, Growth and Development, Developmental Timetable

**315. 4 The hypothalamic-pituitary-gonadal-adrenal mechanism is responsible for the physiologic and structural changes that occur at puberty. In girls the adrenal glands secrete androgens that are responsible for the appearance of axillary and pubic hair.**

**1** This is not an indicator of sexual maturity. **2** This is not a reliable indicator of sexual maturity. **3** Menarche usually occurs about 2 years after initial pubescent changes; ovulation usually begins within a year after the first menstrual period.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Comprehension; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Growth and Development, Developmental Timetable

**316. 2 Adolescents are concerned about body image and fitting in with a peer group; the stabilizing rod may be viewed as an insult to the intactness of the body. The nurse should obtain additional information to confirm this assumption.**

**1** Weight-bearing can be prevented with crutches, which provide greater mobility than a wheelchair. **3** After open reduction and internal fixation with a rod insertion, adolescents generally return to activities after several months. **4** Although pain may be a concern, an adolescent is old enough to understand that analgesics are available; this probably is not the reason the adolescent is upset.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 34, Hospitalization of Adolescents, Data Base

**317. 3 The hyperextension required in swimming aids in strengthening back muscles and increases deeper respirations, both of which are necessary before surgery and/or before wearing a brace or cast.**

**1, 2, 4** This involves twisting the back muscles, which is not therapeutic for a child with this condition.

**Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Scoliosis, Nursing Care

- 318. 1 Continuing growth causes changes in muscle, bone structure, and position. The brace is worn for 6 months after physical maturity, which is confirmed by radiographic examination showing cessation of bone growth.**
- 2** The brace is used to halt the progression of the curvature, not correct it. **3** This is not an appropriate criterion for removal of the brace. **4** Pain is not usually a symptom of scoliosis.
- Client Need:** Basic Care and Comfort; **Cognitive Level:** Application; **Integrated Process:** Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Scoliosis, Data Base
- 319. Answer: 1, 2, 5.**
- 1** A soft-tipped applicator should be used to reduce trauma to the oral mucosa. **2** This allows the fluid to bypass the sores in the mouth and may be less irritating to the mucosa; it provides for comfort. **3** This will injure the oral mucosa and should be avoided. **4** This may irritate the oral mucosa and should be avoided; if prescribed, it should be diluted. **5** Extremes in temperature may injure the oral mucosa and cause discomfort.
- Client Need:** Safety and Infection Control; **Cognitive Level:** Analysis; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Bone Tumors, Nursing Care
- 320. 3 Establishing an identity is the major developmental task of the adolescent; to achieve this task, there is a need to conform to group norms that include appearance and acceptance. Appealing to this need may achieve more success than other teaching strategies.**
- 1** This teaching strategy may be successful with an older, more secure group of people. **2** Adolescents tend to believe that they are invincible and probably will not relate to this teaching strategy. They are also concerned about the present, not the future. **4** Because adolescents believe they are invincible, they would not relate to this teaching strategy.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Growth and Development, Developmental Timetable
- 321. 4 Because adolescents have a developmental need to conform to their peers, the adolescent should be able to select a bracelet with a similar configuration to those worn by peers.**
- 1** Hiding the bracelet under long-sleeved clothes might be acceptable in cool weather, but not when it is warm and friends are wearing T-shirts. **2** The bracelet should be worn at all times when not with responsible family members. The rules of contact sports may not permit the players to wear jewelry that could harm themselves or others. **3** This is unrealistic, especially if the adolescent does not want to tell friends why the bracelet is needed.
- Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Application; **Integrated Process:** Caring; Teaching/Learning; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Hospitalization of Adolescents, General

**322. 1 Although the adolescent should be told that this is a common occurrence at this age, to relieve his anxiety he should be helped to understand and expect both this and other changes that occur during puberty.**

**2, 4** This response may increase the adolescent's anxiety because it implies that he has a problem. **3** This response is not sensitive to the adolescent's concern; it does not offer follow-up discussion, education, or counseling.

**Client Need:** Psychosocial Integrity; **Cognitive Level:** Application; **Integrated Process:** Teaching/Learning; Caring; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Growth and Development, Developmental Timetable

**323. 1 Tinnitus in adolescents is usually related to hearing loud music, especially via headphones.**

**2** Long-resolved ear infections usually have no sequelae, such as buzzing in the ears. **3** Tinnitus is a concrete occurrence; it is doubtful that it will emerge when there is emotional trauma. **4** Familial deafness is not related to the recent development of an adolescent's tinnitus.

**Client Need:** Health Promotion and Maintenance; **Cognitive Level:** Analysis; **Nursing Process:** Assessment/Analysis; **Reference:** Ch 31, Hearing Impairment, Data Base

**324. 3 Passing the high school equivalency test is the client's desire, and the nurse should do everything possible to assist the client to achieve the goal.**

**1** This response is not therapeutic; the client has an unmet need, and the nurse should not try to refocus the client away from the stated objective. **2** The client should be encouraged, not discouraged; mental activity is not too taxing and is not unrealistic if the client wishes to do it. **4** There are no data that support the conclusion that the client needs to work through feelings about the illness.

**Client Need:** Management of Care; **Cognitive Level:** Application; **Integrated Process:** Caring; Communication/Documentation; **Nursing Process:** Planning/Implementation; **Reference:** Ch 34, Hospitalization of Adolescents, General Nursing Care of Adolescents

**325. 1 Albuterol (Proventil) relaxes smooth muscles in the respiratory tract, resulting in bronchodilation. The priority is to facilitate respirations. This intervention follows the ABCs of emergency care—Airway, Breathing, Circulation.**

**2** This is not the priority. The results will not influence the priority intervention. **3** This is not the priority. Chest physiotherapy is performed after the respiratory airways are opened. In many facilities, chest physiotherapy is the responsibility of the nurse, not a respiratory therapist. **4** The use of an incentive spirometer can be taught after the acute episode of respiratory distress. It will take time to receive the device and teach the adolescent.

**Client Need:** Management of Care; **Cognitive Level:** Analysis; **Nursing Process:** Planning/Implementation; **Reference:** Ch 32, Asthma, Nursing Care

---

## UNIT 6

# NCLEX Preparation Toolkit

# CHAPTER 36

# Comprehensive Examination 1

---

# Review Questions: Part A

1. What should the nurse do to assess the neurovascular status of an extremity casted from the ankle to the thigh?

1. Palpate the femoral artery.
2. Assess for a positive Homan sign.
3. Compress and release the client's toenails.
4. Instruct the client to flex and extend the knee.

► 2. A nurse is assessing a client who is experiencing postmenopausal bleeding. The tentative diagnosis is endometrial cancer. Which findings in the client's history are risk factors associated with endometrial cancer? **Select all that apply.**

1. Obesity
2. Multiparity
3. Cigarette smoking
4. Early onset of menopause
5. Family history of endometrial cancer
6. Previous hormone replacement therapy

3. A client who has breast cancer had postlumpectomy chemotherapy and is now scheduled for radiation on an outpatient basis. What is an important nursing intervention while the client is receiving radiation?

1. Assess the radiated site daily for redness or irritation.
2. Rinse the radiated site with an antibacterial solution after each treatment.
3. Instruct the client to apply lotion twice daily to the skin on the radiated area.
4. Encourage the client to wear a snug-fitting bra between radiation treatments.

4. A client's problem with ineffective control of type 1 diabetes is identified when a sudden decrease in blood glucose level is followed by rebound hyperglycemia. What should the nurse do when this event occurs?

1. Give the client a glass of orange juice.
2. Seek an order to increase the insulin dose at bedtime.
3. Encourage the client to eat smaller, more frequent meals.
4. Collaborate with the health care provider to alter the insulin prescription.

5. A client with the diagnosis of personality disorder with antisocial behavior is hospitalized. The client is openly discussing interpersonal difficulties with family members and the boss at work from whom money has been stolen. The client presently is facing criminal charges. Which behavior indicates that the client is meeting treatment goals?

1. Expression of feelings of resentment toward the employer
2. Discussion of plans for each of the possible outcomes of a trial
3. Expression of resignation about difficult spousal and children relationships
4. Discussion of the decision to file a grievance against the employer after discharge from the hospital

6. A client with severe preeclampsia is hospitalized. What should a nurse do **first** to ensure her physical safety?

1. Decrease environmental stimuli.
  2. Place her on seizure precautions.
  3. Administer the prescribed sedatives.
  4. Strictly monitor her intake and output.
7. Which statement by a client with type 2 diabetes indicates to the nurse that additional teaching about the diet is needed?
1. "I can eat as much dietetic fruit as I want."
  2. "I can have a lettuce salad whenever I want it."
  3. "I know that half of my diet should be carbohydrates."
  4. "I need to reduce the amounts of saturated fats in my diet."
8. A child is found to be allergic to dust. The nurse is preparing a teaching plan for the parents. What should the nurse include in the plan?
1. Housework must be done by professional house cleaners.
  2. Damp-dusting the house will help limit dust particles in the air.
  3. The condition must be accepted because dust in a house cannot be limited.
  4. The house must be redecorated because the environment must be dust-free.
9. A client who has just started on a regimen of haloperidol (Haldol) is observed pacing and shifting weight from one foot to another. What side effect does the nurse document in the client's chart?
1. Akathisia
  2. Parkinsonism
  3. Tardive dyskinesia
  4. Acute dystonic reaction
10. A client who has been on a psychiatric unit for several weeks continually talks about delusional material. What response by the nurse is **most** therapeutic?
1. Ask the client to explain the delusion.
  2. Allow the client to maintain the delusion.
  3. Encourage the client to focus on reality issues.
  4. Explain to the client why the thoughts are not true.
11. A client has a tonic-clonic seizure. What is the **priority** nursing intervention during the tonic-clonic stage of the seizure?
1. Go for additional help.
  2. Establish a patent airway.
  3. Turn the client on the side.
  4. Protect the client from injury.
12. A nurse admits an adolescent to the psychiatric unit with the diagnosis of anorexia nervosa. What is the **primary** gain a client with anorexia achieves from this disorder?
1. Reduction of anxiety through control over food
  2. Separation from parents secondary to hospitalization
  3. Release from school responsibilities because of illness
  4. Increased parental attentiveness related to massive weight loss
13. A nurse is caring for a newborn with a myelomeningocele. What should immediate nursing care for this infant include?

1. Changing diapers immediately when moist
  2. Placing the infant in the reverse Trendelenburg position
  3. Applying sterile, moist, nonadherent dressings to the sac
  4. Positioning the infant prone with the legs slightly adducted
- 14. Oxytocin (Pitocin) augmentation via IV piggyback (IVPB) is prescribed for a client in labor after a period of ineffective uterine contractions. What nursing interventions are most important if strong contractions that last 90 seconds or longer occur? **Select all that apply.**
1. Stop the infusion.
  2. Turn the client on her side.
  3. Notify the health care provider.
  4. Verify the length of contractions.
  5. Administer oxygen via a face mask.
15. The cervix of a client in labor is dilated 8 cm. She tells a nurse that she has a desire to push and is becoming increasingly uncomfortable. She requests pain medication. How should the nurse respond?
1. Help her to take panting breaths.
  2. Prepare the birthing bed for the birth.
  3. Assist her out of bed to the bathroom.
  4. Administer the prescribed butorphanol (Stadol).
16. A nurse administers an intramuscular injection of vitamin K to a newborn. What is the purpose of the injection?
1. Maintains the intestinal floral count
  2. Promotes proliferation of intestinal flora
  3. Stimulates vitamin K production in the baby
  4. Provides protection until intestinal flora is established
17. A child with acute poststreptococcal glomerulonephritis requests a snack. Which is the **most** therapeutic selection of food the nurse can provide?
1. Peanuts
  2. Pretzels
  3. Bananas
  4. Applesauce
18. A client reports experiencing nausea, dyspnea, and right upper quadrant pain unrelieved by antacids. The pain occurs most often after eating in fast-food restaurants. Which diet should the nurse instruct the client to follow?
1. Low fat
  2. Low carbohydrate
  3. Soft-textured and bland
  4. High protein and kilocalories
19. A person sustains deep partial-thickness burns while working on a boat in a town marina and seeks advice from the nurse in the first aid station. The nurse encourages the client to seek medical attention, but the client refuses. The nurse advises the person to go to a health care provider if:

1. blisters appear.
  2. urinary output decreases.
  3. edema and redness occur.
  4. low-grade fever develops.
20. A client with a history of gambling has legal difficulties for embezzling money and is required to obtain counseling. During an intake interview, the client says, "I never would have done this if I had been paid what I am worth." What factor will create the greatest difficulty when assisting this client to develop insight?
1. Feelings of boredom and emptiness
  2. Grandiosity related to personal abilities
  3. Projection of reasons for difficulties onto others
  4. Anger toward those who are in authority positions
- 21. A nurse is working with a client who has the diagnosis of borderline personality disorder with antisocial behavior. What personality traits should the nurse expect the client to exhibit? **Select all that apply.**
1. Engaging
  2. Indecisive
  3. Withdrawn
  4. Manipulative
  5. Perfectionistic
22. A client has a urinary retention catheter in place after surgery. What should the nurse do when planning for the client's safety needs in relation to this device?
1. Empty the bag every six hours.
  2. Maintain the tension on the tubing.
  3. Keep the system closed at all times.
  4. Attach the bag to the side rail of the bed.
23. What is the **most** important test the nurse should check to determine whether a transplanted kidney is functioning?
1. Renal ultrasound
  2. Serum creatinine level
  3. White blood cell count
  4. Twenty-four-hour urinary output
24. A pregnant adolescent at 10 weeks' gestation visits the prenatal clinic for the first time. The nutrition interview indicates that her dietary intake consists mainly of soft drinks, candy, French fries, and potato chips. Why does the nurse consider this diet inadequate?
1. Caloric content will result in too great a weight gain.
  2. Ingredients in soft drinks and candy can be teratogenic in early pregnancy.
  3. Salt in this diet will contribute to the development of gestational hypertension.
  4. Nutritional composition of the diet places her at risk for a low-birth-weight infant.
25. A nurse in the prenatal clinic is assessing a woman at 34 weeks' gestation. The client's blood pressure is 166/100 mm Hg and her urine is +3 for protein. She states that she has a severe headache and occasional blurred vision. Her baseline blood pressure was

100/62 mm Hg. What is the **priority** nursing action?

1. Arrange transportation to the hospital.
2. Obtain a prescription for an antihypertensive.
3. Recheck the blood pressure within half an hour.
4. Obtain a prescription for acetaminophen to relieve the headache.

26. A child has cystic fibrosis. Which statement by the parents about their plan for the child's dietary regimen provides evidence that they understand the nurse's instructions?

1. "I will restrict fluids during mealtimes."
2. "I will discontinue the use of salt when cooking."
3. "I should provide high-calorie foods between meals."
4. "I should eliminate whole-milk products from the diet."

27. A nurse is caring for a client with glaucoma. What rationale associated with the need for treatment of this condition should the nurse include in a teaching program?

1. Total blindness is inevitable.
2. Lost vision cannot be restored.
3. Use of both eyes usually is restricted.
4. Surgery will help the problem only temporarily.

28. A nurse is caring for a client with a below-the-knee amputation. What should the nurse encourage the client to do to prepare the residual limb for a prosthesis?

1. Abduct the residual limb when ambulating.
2. Dangle the residual limb off the bed frequently.
3. Soak the residual limb in warm water twice a day.
4. Press the end of the residual limb against a pillow periodically.

29. A client is admitted to the hospital with a diagnosis of an exacerbation of asthma. What should the nurse plan to do to **best** help this client?

1. Determine the client's emotional state.
2. Give prescribed drugs to promote bronchiolar dilation.
3. Provide education about the impact of a family history.
4. Encourage the client to use an incentive spirometer routinely.

30. A health care provider orders daily sputum specimens to be collected from a client. When is the **most** appropriate time for the nurse to collect these specimens?

1. After activity
2. Before meals
3. On awakening
4. Before a respiratory treatment

31. Which factor is essential to consider when a nurse evaluates whether a unit environment is conducive to psychologic safety for a confused client with dementia?

1. Needs are met entirely.
2. Nursing care is flexible.
3. Realistic limits and controls are set.
4. Physical surroundings are clean and orderly.

32. A client is extubated in the postanesthesia care unit after surgery. For which common response should the nurse be alert when monitoring the client for acute respiratory

distress?

1. Restlessness
2. Bradycardia
3. Constricted pupils
4. Clubbing of the fingers

► 33. What clinical findings does a nurse expect when assessing a child with acute laryngotracheobronchitis. **Select all that apply.**

1. Fever
2. Crackles
3. Hoarseness
4. Barking cough
5. Inspiratory stridor

34. An IV infusion of magnesium sulfate is prescribed for a client with severe preeclampsia. The dose is twice the usual adult dose. When a nurse questions the dosage, the health care provider insists that it is the desired dose and directs the nurse to administer the medication. How should the nurse respond to this directive?

1. Administer the dose and monitor the client.
2. Withhold the dose and notify the nurse manager.
3. Administer the dose and document it on the client's record.
4. Withhold the dose and notify the director of the obstetric department.

► 35. A client who is lying in the supine position while in active labor has an IV oxytocin (Pitocin) infusion and external monitors in place. Using the monitoring strips below, identify the appropriate nursing interventions. **Select all that apply.**

1. Administer oxygen.
2. Turn the client on the side.
3. Increase the rate of infusion.
4. Discontinue the oxytocin infusion.
5. Request a prescription for an antibiotic.

36. Which nursing action should be included in the plan of care for a child with acute

poststreptococcal glomerulonephritis?

1. Encouraging fluids
2. Monitoring for seizures
3. Measuring abdominal girth
4. Checking for pupillary reactions

37. A nurse is caring for an older adult who is taking acetaminophen (Tylenol) for the relief of chronic pain. Which substance is **most** important for the nurse to determine the client is taking because it intensifies the most serious adverse effect of acetaminophen?

1. Alcohol
2. Caffeine
3. Saw palmetto
4. St. John's wort

38. The parents of a child who is dying of cancer ask the nurse whether they should tell their 7-year-old son that his sister is dying. What is the **most** appropriate response by the nurse?

1. "Your child cannot comprehend the real meaning of death, so don't tell him until the last moment."
2. "Your son probably fears separation most and wants to know that you will care for him, rather than what will happen to his sister."
3. "You should talk this over with your health care provider, who probably knows best what is happening in terms of your daughter's prognosis."
4. "Your son probably doesn't understand death as we do but fears it just the same. He should be told the truth to let him prepare for his sister's possible death."

▶ 39. A nurse is caring for an underweight adolescent girl who is diagnosed with anorexia nervosa. What are common characteristics of girls with this disorder that the nurse should identify when obtaining a health history and performing a physical assessment? **Select all that apply.**

1. Fatigue
2. Pyrexia
3. Tachycardia
4. Heat intolerance
5. Secondary amenorrhea

40. A client with major depression is admitted to the hospital. What is the **most** therapeutic initial nursing intervention?

1. Introducing the client to one other client
2. Requiring participation in therapy sessions
3. Encouraging interaction with others in small groups
4. Conveying an attitude of concern that is not intrusive

41. During the first trimester, a client tells a nurse at the prenatal clinic that she frequently feels nauseated. What should the nurse teach her about reducing the nausea?

1. Eat small, frequent meals.
2. Take an antacid between meals.
3. Drink cinnamon tincture before rising.

4. Take dimenhyDRINATE (Dramamine) at bedtime.
42. A nurse is caring for a client with a history of chronic obstructive pulmonary disease (COPD). What complications are most commonly associated with COPD?
1. Cardiac problems
  2. Joint inflammation
  3. Kidney dysfunction
  4. Peripheral neuropathy
43. A new parent asks a nurse how to care for the baby's umbilical cord stump. What should the nurse include in the teaching?
1. Expect a moderate amount of drainage.
  2. Keep the area moist with sterile normal saline.
  3. Provide sponge baths until the stump falls off.
  4. Cover the site with a small sterile dressing twice a day.
44. After resection of a lower lobe of the lung, a client has excessive respiratory secretions. Which independent nursing action should the nurse implement?
1. Postural drainage
  2. Turning and positioning
  3. Administration of an expectorant
  4. Percussion and vibration techniques
45. A health care provider explains a cystectomy and an ileal conduit to a client with invasive carcinoma of the bladder. Later the client expresses concerns about the possibility of offensive odors associated with this procedure. What is the **best** response by the nurse?
1. "Tell me more about what you are thinking."
  2. "Products are available to limit this problem."
  3. "This is a problem, but the surgery is necessary."
  4. "Most people who have this surgery share this same concern."
46. Using Piaget's theory of cognitive development, what should the nurse expect a 6-month-old infant to demonstrate?
1. Early traces of memory
  2. Beginning sense of time
  3. Repetitious reflex responses
  4. Beginning of object permanence
47. An internal fetal monitor is applied while a client is in labor. What should the nurse explain about positioning while the monitor is in place?
1. The most comfortable position can be assumed.
  2. Monitoring is more accurate in the side-lying position.
  3. The monitor leads can be detached when sitting on the bedpan.
  4. Maintaining a supine position holds the internal electrode in place.
48. During a newborn assessment a nurse reports a sign of respiratory distress. What clinical manifestation did the nurse identify?
1. Flaring nares
  2. Rapid heart rate

3. Abdominal respirations
4. Decreased respiratory rate
49. On the third postpartum day, a woman who is breastfeeding calls the nurse at the clinic and asks why her breasts are tight and swollen. What should the nurse consider before explaining why her breasts are engorged?
  1. There is an overabundance of milk.
  2. Breastfeeding probably is ineffective.
  3. The breasts have been inadequately supported.
  4. The lymphatic system in the breasts is congested.
50. A person on the beach sustains a deep partial-thickness burn because of a severe sunburn. What is the **best** first-aid measure that a nurse should instruct the person to apply before seeking health care?
  1. Cool, moist towels
  2. Dry, sterile dressings
  3. Analgesic sunburn spray
  4. Vitamin A and D ointment
51. A nurse is assessing a newborn. What finding indicates the need for follow-up care?
  1. Babinski reflex is positive.
  2. Head circumference is 33 cm.
  3. Hips are abducted at 30 degrees.
  4. Umbilical cord has three vessels.
52. A nurse is assessing a group of older adults. Which should the nurse consider to be **least** likely to be affected by aging?
  1. Sense of taste or smell
  2. Gastrointestinal motility
  3. Muscle or motor strength
  4. Strategies to handle stress
- 53. Nurses who care for the terminally ill apply the theories of Kübler-Ross in planning care. According to Kübler-Ross, individuals who experience a terminal illness go through a grieving process. Place the stages of this process in the order identified by Kübler-Ross.
  1. \_\_\_\_\_ Anger
  2. \_\_\_\_\_ Denial
  3. \_\_\_\_\_ Bargaining
  4. \_\_\_\_\_ Depression
  5. \_\_\_\_\_ Acceptance
54. What should be the **initial** nursing action after the birth of a preterm infant with an Apgar score of 6?
  1. Check and clamp the umbilical cord.
  2. Dry the infant and place in a warm environment.
  3. Obtain a footprint and apply an identification band.
  4. Get resuscitative equipment and assist the health care provider.
55. Which is **most** important for the nurse to do when providing care to a client who has had a transurethral resection of the prostate?

1. Maintain patency of the cystostomy tube.
2. Ensure patency of the indwelling catheter.
3. Keep the abdominal dressing clean and dry.
4. Observe the wound for hemorrhage and infection.

► 56. A client is to receive 125 mL of IV fluid every hour. The drop factor of the IV tubing is 10 gtt/mL. How many drops per minute should the nurse administer? **Record your answer using a whole number.**

Answer: \_\_\_\_\_ gtt/min

57. A client on a psychiatric unit who has been hearing voices is receiving a neuroleptic medication for the first time. The client takes the cup of water and the pill and stares at them. What is the **most** therapeutic statement the nurse can make?

1. "You have to take your medicine."
2. "Your doctor wants you to have this medicine. Swallow it."
3. "There must be a reason why you don't want to take your medicine."
4. "This is the medication that your doctor ordered for you to make you well."

58. After a therapy session with a health care provider in the mental health clinic, a client tells the nurse that the therapist is uncaring and impersonal. What is the nurse's **best** response?

1. "Your therapist is really very good."
2. "I hope that the rest of the staff is caring."
3. "The therapist is there to help you; try to cooperate."
4. "You have strong feelings about your therapy session and your therapist."

59. A client who has just had a kidney transplant is transferred from the postanesthesia care unit (PACU) to the intensive care unit (ICU). How often should the nurse in the ICU monitor the client's urinary output?

1. Every hour.
2. Every 2 hours.
3. Every half hour.
4. Every 15 minutes.

60. A client who uses ritualistic behavior taps other clients on the shoulders three times while going through the ritual. The nurse infers that this client has a:

1. blurred personal identity.
2. poor control of sudden urges.
3. disturbance in spatial boundaries.
4. reduced ability to adapt to life's stresses.

61. A pregnant client with severe preeclampsia is receiving IV magnesium sulfate. What should the nurse keep at the bedside to prepare for the possibility of magnesium sulfate toxicity?

1. Oxygen
2. Naloxone
3. Calcium gluconate
4. Suction equipment

62. A person who is hospitalized for alcoholism becomes boisterous and belligerent and

verbally threatens the nurse. What is the **most** appropriate response by the nurse?

1. Place the client in restraints.
2. Sedate and place the client in a controlled environment.
3. Encourage the client to play Ping Pong with another client.
4. Set firm limits on the client's behavior and enforce adherence to them.

63. A family of a client with myasthenia gravis asks the nurse whether the client will be an invalid. What is the nurse's **best** response?

1. "Medications will mask the signs of the disease."
2. "With continuous treatment, the progression of the disease usually can be controlled."
3. "There will be periods when bed rest will be necessary and times when regular activity will be possible."
4. "The progression generally is slow, so people with myasthenia will spend their younger life with few problems."

64. A parent of a 2-year-old child who was just diagnosed with cystic fibrosis expresses concern about the child's frailty and low weight. What is the nurse's **most** appropriate reply?

1. "Digestive enzymes will be given to help your child digest food."
2. "Your child's appetite will improve once respiratory therapy is initiated."
3. "Your child's coughing and shortness of breath prevent adequate chewing of food."
4. "I suggest that you offer baby foods to your child because they are more easily digested."

65. During the first well-baby visit after discharge from the hospital, the parents inform the nurse that their baby has difficulty sucking and swallowing and tires easily. What should the nurse consider when assessing this infant?

1. Newborns tend to tire easily, especially when feeding.
2. Decreased sucking is insignificant in the absence of cyanosis.
3. Difficulty when feeding may be an early indication of a heart defect.
4. Some infants retain mucus for several days that may interfere with feeding.

66. For which clinical indicator should the nurse monitor a child with chronic hypoxia?

1. Clubbing of fingers
2. Slow, irregular respirations
3. Subcutaneous hemorrhages
4. Decreased red blood cell count

67. A nurse is caring for a client with a fracture of the head of the femur. The health care provider places the client in a Buck extension. What explanation does the nurse give the client for why the traction is being used?

1. Reduces muscle spasms.
2. Prevents soft tissue edema.
3. Reduces the need for cast application.
4. Prevents damage to the surrounding nerves.

68. A client has a total hip arthroplasty. What should the nurse do when caring for this client after surgery?

1. Use a pillow to keep the legs abducted.

2. Elevate the client's affected limb on a pillow.
  3. Turn the client using the log-rolling technique.
  4. Place a trochanter roll along the entire extremity.
69. Which client in a psychiatric unit needs immediate therapeutic intervention from the nurse?
1. 50-year-old woman who is pacing around the dayroom and picking fights with other clients
  2. 25-year-old man who is making sounds and actions like a machine gun in front of the nurse's station
  3. 45-year-old man who sits quietly in the corner of the room, watching the movements of other clients
  4. 33-year-old woman who wanders aimlessly around the unit, saying, "I just don't know what to do. I feel so lost."
70. A client in a psychiatric hospital with the diagnosis of major depression is tearful and refuses to eat dinner after a visit with a friend. What is the **most** therapeutic nursing action?
1. Allow the client to skip the meal.
  2. Offer an opportunity to discuss the visit.
  3. Reinforce the importance of adequate nutrition.
  4. Provide the client with adequate quiet thinking time.
71. A person with a history of alcoholism states, "I have been drinking since last Friday to celebrate my son's graduation from college." What defense mechanism does the nurse identify the client is using?
1. Projection
  2. Suppression
  3. Identification
  4. Rationalization
- 72. A nurse is caring for a client in respiratory distress. The health care provider orders oxygen via a nonrebreather mask. Which mask should the nurse obtain to implement the oxygen order?
- 1.

2.

3.

4.

73.

The parents of a child with spasmodic croup ask why their child is receiving humidified oxygen. What effect of humidified oxygen should the nurse include in the explanation?

1. Minimizes tissue edema
2. Provides a mode for giving inhalant drugs
3. Increases the surface tension of the respiratory tract
4. Provides an environment free of pathogenic organisms

74. A client has a surgical creation of a colostomy. What is the **most** effective nursing intervention to initially help the client accept the colostomy?

1. Introduce equipment needed to care for the colo-stomy.
2. Provide literature containing factual data about colostomies.
3. Ask a member of a support group to come to speak with the client.
4. Point out the number of important people who have had colostomies.

75. When planning care for a child with autism, the nurse understands that given a choice, the child with autism usually enjoys playing:

1. on a jungle gym.
2. with a cuddly toy.

3. with a small yellow block.
4. on a playground merry-go-round.
  - Denotes alternate format question.

# Review Questions: Part B

76. A client who is at 26 weeks' gestation arrives at the clinic for her scheduled examination. Her blood pressure is 150/86. She tells the nurse that she has gained 5 pounds in the last 2 weeks. What is the **priority** nursing action?

1. Test the client's urine for albumin.
2. Take the client's body temperature.
3. Prepare the client for a vaginal examination.
4. Schedule the client for an appointment in a week.

77. What behavior does a nurse expect of a newborn about 1 hour after birth?

1. Crying and cranky
2. Hyperresponsive to stimuli
3. Relaxed and sleeping quietly
4. Intensely alert with eyes wide open

78. A client who has a phobia about dogs is about to begin systematic desensitization. The client asks what the treatment will involve. What is the nurse's **best** response?

1. "You will be exposed to dogs until you no longer feel anxious."
2. "Rewards will be given when you do not become anxious around dogs."
3. "Your contact with dogs will increase while using relaxation techniques."
4. "There will be in-depth discussions to identify what caused your phobia."

79. A nurse is providing dietary teaching for a client who is receiving a high-protein diet while recovering from an acute episode of colitis. What should the nurse include in the rationale for this diet?

1. Repairs tissues
2. Slows peristalsis
3. Corrects the anemia
4. Improves muscle tone

80. A nurse is caring for a client experiencing an acute episode of bronchial asthma. What outcome should be achieved?

1. Raising mucous secretions from the chest
2. Curing the client's condition permanently
3. Limiting pulmonary secretions by decreasing fluid intake
4. Convincing the client that the condition is emotionally based

81. When a developmental appraisal is performed on a 6-month-old infant, which observation is **most** important to the nurse in light of a diagnosis of hydrocephalus?

1. Head lag
2. Positive Babinski reflex
3. Inability to sit unsupported
4. Absence of the grasp reflex

82. A new mother refuses to look at her newborn who has a severe birth defect. What is the nurse's **most** therapeutic approach?

1. Request that the family try to distract her.
2. Clarify why she should stop blaming herself for the baby's handicap.

3. Reinforce the explanation of the handicap and allow time for her to discuss her fears.
  4. Wait until she has sufficiently recovered from the stress of birth and then bring the baby to her again.
83. When teaching a class about parenting, the nurse asks the participants what they do when their toddlers have a temper tantrum. Which statement demonstrates one parent's understanding of the origin of temper tantrums?
1. "After a temper tantrum, I discipline my child by restricting a favorite food or activity."
  2. "When a temper tantrum begins, I isolate and ignore my child until the behavior improves."
  3. "During a temper tantrum, I partially gives in to my child before the tantrum becomes excessive."
  4. "I try to prevent a temper tantrum by allowing my child to choose between two reasonable alternatives."
84. A nursing assistant interrupts the performance of a ritual by a client with obsessive-compulsive disorder. What is the **most** likely client reaction?
1. Anxiety
  2. Hostility
  3. Aggression
  4. Withdrawal
85. When a nurse is working with a client with psychiatric problems, a primary goal is the establishment of a therapeutic nurse-client relationship. What is the **major** purpose of this relationship?
1. Increase nonverbal communication
  2. Present an outlet for suppressed hostile feelings
  3. Assist the client in acquiring more effective behavior
  4. Provide the client with someone who can make decisions
86. An African-American woman is diagnosed with primary hypertension. She asks, "Is hypertension a disease of African-American people?" What is the nurse's **best** response?
1. "The prevalence of hypertension is about equal for women of all races."
  2. "The higher-risk population is composed of African-American men and women."
  3. "The highest-risk population consists of older Caucasian-American men and women."
  4. "The prevalence of hypertension is greater for African-American women than for African-American men."
87. A health care provider prescribes a diuretic for a client with hypertension. What should the nurse include in the teaching when explaining how diuretics reduce blood pressure?
1. Facilitates vasodilation
  2. Promotes smooth muscle relaxation
  3. Reduces the circulating blood volume
  4. Blocks the sympathetic nervous system
88. A nurse is caring for a client who is receiving a thiazide diuretic for hypertension. Which food selected by the client indicates to the nurse that dietary teaching about

thiazide diuretics was effective?

1. Apples
2. Broccoli
3. Cherries
4. Cauliflower

89. A 20-year-old college student comes to the college health clinic reporting increasing anxiety, loss of appetite, and an inability to concentrate. What is the **most** appropriate response by the nurse?

1. "With whom have you shared your feelings of anxiety?"
2. "What have you identified as the cause of your anxiety?"
3. "It has been difficult for you. How long has this been going on?"
4. "Let's talk about your problems. Are you having difficulty adjusting?"

90. A nurse is caring for a client who attempted suicide. What is the **most** desirable short-term client outcome during this crisis situation?

1. Strengthening coping skills
2. Establishing a no-suicide contract
3. Learning problem-solving techniques
4. Recognizing why suicide was attempted

91. A  $3\frac{1}{2}$ -year-old child is admitted to the hospital for an appendectomy. What should the nurse use to **best** prepare the child for the hospital experience?

1. A diagram
2. Puppet play
3. A storybook
4. Therapeutic play

92. A client with adrenal insufficiency reports feeling weak and dizzy, especially in the morning. What should the nurse determine is the **most** probable cause of these symptoms?

1. A lack of potassium
2. Postural hypertension
3. A hypoglycemic reaction
4. Increased extracellular fluid volume

93. A client is admitted to the hospital with a diagnosis of chronic kidney failure. For signs of what electrolyte imbalance should the nurse monitor the client?

1. Hypokalemia
2. Hypocalcemia
3. Hypernatremia
4. Hyperglycemia

94. During her sixth month of pregnancy, a woman visits the prenatal clinic for the first time. As part of the initial assessment, a CBC and a urinalysis are performed. Which laboratory finding should alert the nurse that further assessment is required?

1. WBC count of  $9000/\text{mm}^3$
2. Hemoglobin level of 10 g/dL
3. Urine specific gravity of 1.020

4. Glucose level of 1+ in the urine

95. Two hours after an uneventful labor and birth, a client's uterus is four fingerbreadths above the umbilicus. After urinary catheterization, the fundus remains firm and four fingerbreadths above the umbilicus. What is the **priority** nursing action?

1. Recheck the vital signs.
2. Catheterize again in 1 hour.
3. Notify the health care provider.
4. Palpate the fundus every 2 hours.

► 96. A client receives spinal anesthesia during labor and birth. Twenty-four hours later, she tells a nurse that she has a headache. Which statements indicate to the nurse that the headache is a reaction to the anesthesia? **Select all that apply.**

1. "I have ringing in my ears."
2. "It improves when I lie down."
3. "Bright lights really bother my eyes."
4. "It gets better as soon as I walk a while."
5. "My head hurts more when I am sitting watching TV."
6. "My head hurts more when I am lying on my side breastfeeding."

97. A client has a history of hypothyroidism. Which skin condition should the nurse expect when performing a physical assessment?

1. Dry
2. Moist
3. Flushed
4. Smooth

98. A nurse is caring for a client who has had an open reduction internal fixation of a fractured hip. Which nursing assessment of the affected leg is **most** important after this surgery?

1. Femoral pulse
2. Toes for mobility
3. Condition of the pin
4. Range of motion of the knee

99. A nurse is caring for a client with myxedema who has undergone abdominal surgery. What should the nurse consider when administering opioids to this client?

1. Tolerance to the drug develops readily.
2. One third to one half the usual dose should be prescribed.
3. Opioids may interfere with the secretion of thyroid hormones.
4. Sedation will have a paradoxical effect, causing hyperactivity.

100. A nurse is caring for a child with spasmodic croup. Which clinical finding alerts the nurse that immediate nursing intervention is required?

1. Irritability
2. Hoarseness
3. Barking cough
4. Rapid respirations

101. What must the nurse emphasize to the family when preparing a child with

persistent asthma for discharge?

1. A cold, dry environment is desirable.
2. Limits should not be placed on the child's behavior.
3. The health problem is gone when symptoms subside.
4. Medications must be continued even when asymptomatic.

102. An older adult with dementia is admitted to a nursing home. The client is confused, agitated, and at times unaware of the presence of others. What is the **best** nursing approach to help this client adapt to the unit?

1. Initiate a program of planned interaction.
2. Explain the nature and routines of the unit.
3. Explore in depth the reasons for the admission.
4. Provide for the continuous presence of a staff member.

103. The parents of a child with a fever, headache, and stiff neck express concern that the child be tested for meningitis. Which test should the nurse explain to the parents is used to confirm the diagnosis of meningitis?

1. Myelogram
2. Blood culture
3. Lumbar puncture
4. Peripheral skin smear

104. A nurse is caring for a client after a left pneumonectomy for cancer. The nurse palpates the client's trachea routinely. What is the rationale for this nursing intervention?

1. A mediastinal shift may have occurred.
2. Nodular lesions may demonstrate metastasis.
3. Tracheal edema may lead to an obstructed airway.
4. The cuff of the endotracheal tube may be overinflated.

105. A CBC, urinalysis, and x-ray examination of the chest are ordered for a client before surgery. The client asks why these tests are done. Which is the **best** reply by the nurse?

1. "Don't worry; these tests are routine."
2. "They are done to identify other health risks."
3. "They determine whether surgery will be safe."
4. "I don't know; your health care provider ordered them."

106. A client is scheduled for emergency abdominal surgery. What is the priority preoperative nursing objective when caring for this client?

1. Recording accurate vital signs
2. Alleviating the client's anxiety
3. Teaching about early ambulation
4. Maintaining the client's nutritional status

107. An infant born with hydrocephalus is to be discharged after insertion of a ventriculoperitoneal shunt. Which common complication of this type of surgery should the nurse explain to the parents to prepare them for their child's discharge?

1. Violent involuntary muscle contractions
2. Eyes with sclerae visible above the irises

3. Excessive fluid accumulation in the abdomen
4. Fever accompanied by decreased responsiveness
108. Parents are considering a bone marrow transplant for their child who has recurrent leukemia. The parents ask the nurse for clarification about the procedure. What is the **best** response by the nurse?
  1. "It is rarely performed in children."
  2. "The immune system must be destroyed before a transplant can take place."
  3. "The hematopoietic stem cells are surgically implanted in the bone marrow."
  4. "It is a simple procedure with little preparation needed, and the stem cells are infused as in a blood transfusion."
109. What is **most** important for a nurse to do when helping a new mother on the postpartum unit develop her parenting role?
  1. Teach her how to care for the infant.
  2. Provide time for her and her infant to be together.
  3. Respond to any questions she has about her infant's behavior.
  4. Demonstrate infant care and evaluate her return demonstration.
110. When performing a newborn assessment after a vaginal birth, a nurse observes a swelling on one side of the top of the head. What clinical manifestation did the nurse identify?
  1. Caput succedaneum that will spread across the scalp and then resolve
  2. Fontanel that bulges when the infant cries and will close in eighteen months
  3. Cephalohematoma that does not cross the suture line and will resolve in several weeks
  4. Molding that results from the skull taking the shape of the vagina and will disappear in several days
111. A health care provider prescribes famotidine (Pepcid) for a client with dyspepsia. What is important to include about this medication in a teaching program for this client?
  1. Lowers the stress level
  2. Neutralizes gastric acidity
  3. Reduces gastrointestinal peristalsis
  4. Decreases secretions in the stomach
112. Although a nurse is unable to identify any obvious signs or symptoms of bleeding, a client repeatedly has tested positive for occult blood in the stool. Which laboratory result is a concern considering this client's history?
  1. Iron level 100 mcg/dL
  2. Uric acid level 6.5 mg/dL
  3. Hemoglobin level 8.5 g/dL
  4. Transferrin level 300 mg/dL
113. A nurse is caring for a client with severe gastritis who vomited a large amount of blood. A lavage is ordered by the health care provider. Which response does the nurse expect when using a room temperature irrigating solution?
  1. Coagulation of blood
  2. Neutralization of acids
  3. Constriction of blood vessels

4. Stimulation of the vagus nerve

114. A blood transfusion is initiated after a client has had emergency surgery. What should the nurse do **first** when the client develops fever, chills, and low back pain?

1. Notify a health care provider.
2. Stop the blood and infuse saline.
3. Obtain a prescription for an antihistamine.
4. Slow the rate of the transfusion and inform the blood bank.

115. When entering a room, a nurse finds new parents looking at their newborn, who is lying in the bassinet with eyes wide open. What action should the nurse take in response to this infant's behavior?

1. Turn on the lights in the room.
2. Begin the physical assessment.
3. Position the infant on the right side.
4. Encourage the parent to talk to the infant.

116. A nurse determines that a postpartum client is gravida 1 and para 1. Her blood type is B negative, and her baby's blood type is O positive. What should the nurse include in the plan of care?

1. Type and crossmatch blood.
2. Obtain an order for RhoGAM.
3. Determine the father's blood type.
4. Observe for signs of ABO incompatibility.

117. While changing a newborn's diaper, a client expresses concern about a small spot of red vaginal discharge on the diaper. How should the nurse respond to this concern?

1. Assess for other signs of bleeding.
2. Obtain an order for vaginal cultures.
3. Explain that this is an expected finding.
4. Apply a urine specimen bag to the perineum.

► 118. Which clinical findings should the nurse expect when assessing a client with hyperthyroidism? **Select all that apply.**

1. Lethargy
2. Tachycardia
3. Weight gain
4. Constipation
5. Exophthalmos

119. What concept of death should a nurse expect a preschool-age child to have?

1. Cessation of life
2. Reversible separation
3. Happening that affects old people
4. Someone who takes one away from the family

120. A nurse is assessing a client with major depression. Which clinical manifestation reflects a disturbance in affect related to depression?

1. Echolalia
2. Delusions

3. Confusion

4. Hopelessness

121. A client is admitted to the birthing unit in active labor. An amniotomy is performed. What physiologic change does the nurse expect to occur after the procedure?

1. Diminished vaginal bleeding

2. Less discomfort with contractions

3. Progressive dilation and effacement

4. Increased maternal and fetal heart rates

122. A nurse is caring for a client in labor. What client response indicates that the transition phase of labor probably has begun?

1. Assumes the lithotomy position

2. Perspires and has a flushed face

3. Indicates back and perineal pain

4. Exhibits decreases in frequency of contractions

123. A client with a history of alcohol abuse says to the nurse, "Drinking is a way out of my depression." Which strategy probably is **most** effective for the client at this time?

1. A self-help group

2. Psychoanalytic therapy

3. A visit with a religious advisor

4. Talking with an alcoholic friend

124. A nurse explores with a client who has a history of drug abuse the possibility of joining Narcotics Anonymous (NA). What is a major reason NA is helpful in treating addictive behavior?

1. More change will take place within the group.

2. Group members are supportive of each other's problems.

3. Group members share a common background and history.

4. Addiction problems are dealt with more effectively in a group.

125. A client undergoes cardiac catheterization via the femoral artery because of a history of bilateral mastectomies. What is the **most** important nursing action after the procedure?

1. Provide a bed cradle.

2. Check for a pulse deficit.

3. Elevate the head of the bed.

4. Assess the groin for bleeding.

126. A client with heart failure is on a drug regimen of digoxin (Lanoxin) and furosemide (Lasix). The client dislikes oranges and bananas. Which fruit should the nurse encourage the client to eat?

1. Apples

2. Grapes

3. Apricots

4. Cranberries

127. A client in whom sexual dysfunction is diagnosed comments to the nurse, "Well, I guess my sex life is over." What is the **most** appropriate response by the nurse?

1. "I'm sorry to hear that."
  2. "Oh, you have a lot of good years left."
  3. "You are concerned about your sex life?"
  4. "Have you asked your health care provider about that?"
128. A hospitalized client hurriedly approaches the nurse, saying that it sounds like there is a roaring fire in the bathroom. In reality, the client's roommate has just turned the shower on full force. What term **best** describes this experience?
1. Illusion
  2. Delusion
  3. Dissociation
  4. Hallucination
129. A newborn with acquired herpes simplex virus infection is being discharged. Which developmental pattern is important for the nurse to teach the parents to monitor?
1. Visual clarity
  2. Renal function
  3. Long bone growth
  4. Responses to sounds
130. A health care provider prescribes tolterodine (Detrol) for a client with an overactive bladder. What is most important for the nurse to teach the client to do?
1. Maintain a strict record of fluid intake and urinary output.
  2. Chew the extended release capsule thoroughly before swallowing.
  3. Report episodes of diarrhea or any increase in respiratory secretions.
  4. Avoid activities requiring alertness until the response to medication is known.
131. A nurse is selecting toys for a 5-month-old infant. Which toy should not be given to the infant?
1. Large snap beads
  2. Soft stuffed animals
  3. Rattles that can be held
  4. Brightly colored mobiles
132. An infant who was just circumcised is to be discharged with his parents. What should the nurse include in the discharge instructions about postcircumcision care?
1. Apply diapers loosely.
  2. Withhold feedings for 6 hours.
  3. Cleanse the site with alcohol daily.
  4. Expect some bleeding for 48 hours.
133. A client in a mental health facility with the diagnosis of bipolar disorder, manic phase, is argumentative, domineering, and exhibitionistic. A visitor reports that this client is running down the hall scaring people. What should the nurse do **first**?
1. Ask the client the reason for running down the hall.
  2. Approach the client along with several staff members.
  3. Assess the client's behavior in a nonthreatening manner.
  4. Contact the client's health care provider for an order for seclusion.
- 134. A nurse is caring for a 3-year-old child with meningitis. For what signs and

symptoms of increased intracranial pressure should the nurse assess the child? **Select all that apply.**

1. Vomiting
2. Headache
3. Irritability
4. Tachypnea
5. Hypotension

135. An older adult is admitted to a nursing home with the diagnosis of dementia. When the nurse is assessing this client's mental status, what question **best** tests the ability for abstract thinking?

1. "Can you give me today's complete date?"
2. "How are a television set and a radio alike?"
3. "What would you do if you fell and hurt yourself?"
4. "Can you repeat the following numbers: 8, 3, 7, 1, 5?"

136. A male client receiving hemodialysis undergoes surgery to create an arteriovenous fistula. Before discharge, the nurse discusses care at home with the client and his wife. Which statement by the client's wife indicates that further teaching is required?

1. "I must touch the shunt several times a day to feel for the bruit."
2. "I have to take his blood pressure every day in the arm with the fistula."
3. "He will have to be very careful at night not to lie on the arm with the fistula."
4. "We really should check the fistula every day for signs of redness and swelling."

137. An older adult male with dementia is admitted to a nursing home. His wife appears frail, tired, and angry when she first visits her husband. She remarks to the nurse in a sarcastic tone, "Let's see what you can do with him." What is the nurse's **most** therapeutic response?

1. "It has been very difficult to care for him."
2. "I don't understand what you mean by that comment."
3. "I know how to care for clients such as your husband."
4. "It's too bad you didn't get some help to care for him at home."

138. A client is admitted to the hospital with a diagnosis of myasthenia gravis. For which common early clinical finding should the nurse assess the client?

1. Tearing
2. Blurring
3. Diplopia
4. Nystagmus

139. What should the nurse emphasize when providing discharge instructions for a client with the diagnosis of Addison disease?

1. Limit physical activity.
2. Restrict sodium in the diet.
3. Continue steroid replacement therapy.
4. Schedule frequent health care appointments.

► 140. A hospitalized client is receiving pyridostigmine (Mestinon) for control of myasthenia gravis. In the middle of the night, the nurse finds the client weak and barely

able to move. Which additional clinical findings support the conclusion that these responses are related to pyridostigmine? **Select all that apply.**

1. Respiratory depression
2. Distention of the bladder
3. Decreased blood pressure
4. Fine tremor of the fingers
5. High-pitched gurgling bowel sounds

141. A newborn is admitted to the neonatal intensive care unit (NICU) with a myelomeningocele. What is the **priority** nursing intervention during the first 24 hours?

1. Use only disposable diapers.
2. Place the infant prone or in a side-lying position.
3. Wash the infant's genital area with an antiinfective.
4. Perform neurologic checks above or at the site of the lesion.

142. A client with multiple sclerosis is in remission. Which diversional activity should the nurse encourage that **best** meets the client's needs while in remission?

1. Hiking
2. Swimming
3. Computer classes
4. Watching television

143. A parent whose newborn infant son has a cleft lip and palate asks the nurse, "How should I feed my baby because he has difficulty sucking?" What information should the nurse provide concerning a safe feeding technique for this infant?

1. "Since he tires easily, it is best to have him lying in bed while he is being fed."
2. "He should be held in a horizontal position and fed slowly to avoid aspiration."
3. "Try using a soft nipple with an enlarged opening so he can get the milk through a chewing motion."
4. "Give him brief rest periods and frequent burpings during feedings so he can get rid of swallowed air."

144. A client at 16 weeks' gestation calls the nurse at the prenatal clinic and states that her partner just told her he has genital herpes. What should the nurse include when teaching the client about sexual activity?

1. Condoms must be used when having intercourse.
2. Sexual abstinence should be practiced during the last six weeks.
3. It will be necessary to refrain from sexual contact during pregnancy.
4. Meticulous cleaning of the vaginal area after intercourse is essential.

145. Early in the ninth month of pregnancy a client experiences painless vaginal bleeding and is admitted to the hospital. What should the client's plan of care include?

1. Giving vitamin K to promote clotting
2. Performing a rectal examination to assess cervical dilation
3. Administering an enema to prevent contamination during birth
4. Placing her in the semi-Fowler position to increase cervical pressure

146. Which criterion should a nurse use when assessing the gestational age of a preterm infant?

1. Simian creases
2. Breast bud size
3. Reflex stability
4. Fingernail length

147. What client behavior indicates to the nurse that a client with schizophrenia, undifferentiated type, is improving and that the client's plan of care can be updated?

1. Stays away from other clients.
2. Expresses negative feelings freely.
3. Verbalizes better-developed delusions.
4. Communicates in an organized manner.

148. A client who has a diagnosis of paranoid schizophrenia and has been violent in the past is admitted to the psychiatric unit. What should the nurse do before performing an admission interview?

1. Move to the client's side and sit down.
2. Alert the assault response team about the client's history.
3. Have two other staff members present when talking with the client.
4. Enter the room with another staff member, while remaining between the client and the door.

► 149. A client at 38 weeks' gestation is admitted to the high-risk prenatal unit with a diagnosis of severe preeclampsia. The nurse obtains the vital signs, performs a health history and physical assessment, and reviews the client's laboratory results. What is the **priority** nursing intervention?

### **Vital Signs**

Blood pressure: 180/116 mm Hg

Pulse: 84 beats per minute

Respirations: 20 breaths per minute

### **Nursing Health History & Physical Assessment**

Headache

Confusion

Blurred vision

5-pound weight gain in 1 week

### **Laboratory Results**

Proteinuria: +3

Serum creatinine: 1.4 mg/dL

Platelets: 90,000/mm<sup>3</sup>

1. Monitor intake and output.
2. Provide a dark private room.

3. Measure the extent of edema.
4. Prepare for an immediate cesarean birth.
150. What is the **priority** when the nurse is establishing a therapeutic environment for a client?
  1. Providing for the client's safety
  2. Accepting the client's individuality
  3. Promoting the client's independence
  4. Explaining to the client what is being done
151. What is the **main** reason why a nurse raises three of the four side rails on the bed of a 63-year-old client who has had surgery for a fractured hip?
  1. As a safety measure because of the client's age
  2. Because older adults should use side rails for safety
  3. To be used as handholds to facilitate the client's ability to move in bed
  4. Because older adults often are disoriented for several days after anesthesia
152. A  $4\frac{1}{2}$ -year-old child is brought to the emergency department with a fractured tibia. Which type of fracture should the nurse anticipate will be diagnosed because it is the **most** frequently encountered fracture in children of this age?
  1. Greenstick
  2. Transverse
  3. Compound
  4. Comminuted
153. A health care provider prescribes transdermal fentanyl (Duragesic) 25 mcg/hr every 72 hours. What is **most** important for the nurse to do during the first 24 hours after starting the fentanyl?
  1. Titrate the dose until pain is tolerable.
  2. Manage pain with oral pain medication.
  3. Assess the client for anticholinergic side effects.
  4. Take with food to reduce the risk of gastrointestinal upset.
154. A client enters the emergency department, reporting shortness of breath and epigastric distress. What should be the triage nurse's **first** intervention?
  1. Assess vital signs.
  2. Insert a saline lock.
  3. Place client on oxygen.
  4. Draw blood for troponins.
- 155. A client is in the intensive care unit after sustaining a T2 spinal cord injury. Which priority interventions should the nurse include in the client's plan of care? **Select all that apply.**
  1. Minimizing environmental stimuli
  2. Assessing for respiratory complications
  3. Monitoring and maintaining blood pressure
  4. Initiating a bowel and bladder training program
  5. Discussing long-term treatment plans with the family
156. A client is scheduled for a vacuum aspiration abortion to terminate a pregnancy.

What should the nurse's teaching plan include?

1. It is a lengthy procedure but will cause no pain.
2. Both she and the father must sign the consent form.
3. An elevated temperature of 100.4° F or more should be reported immediately.
4. She will experience a heavy menstrual flow for 1 to 2 weeks after the procedure.

157. A client asks for and receives instruction regarding birth control methods. She elects to use a diaphragm with a spermicide. What disadvantage of using a diaphragm should be explained to the client?

1. It fails half the time when used alone.
2. It is physically uncomfortable when in place.
3. Thrombus formation and pulmonary emboli may occur.
4. Some women find insertion and removal to be objectionable.

158. A client's sputum smears for acid-fast bacillus (AFB) are positive, and transmission-based precautions are instituted. What should the nurse teach family members to do?

1. Avoid contact with objects in the room.
2. Limit their contact with nonexposed people.
3. Put on a gown and gloves before going into the room.
4. Wear a high-efficiency particulate respirator when visiting.

159. A health care provider prescribes psyllium (Metamucil) 3.5 g twice a day for constipation. What is **most** important for the nurse to teach this client?

1. Urine may be discolored.
2. Each dose should be taken with a full glass of water.
3. Use only when necessary because it can cause dependence.
4. Daily use may inhibit the absorption of some fat-soluble vitamins.

160. A nurse is caring for a client with heart failure. The health care provider orders a 2 g sodium diet. What should the nurse include when explaining how a low-salt diet helps achieve a therapeutic outcome?

1. Allows excess tissue fluid to be excreted.
2. Helps to control food intake and thus weight.
3. Aids the weakened heart muscle to contract and improves cardiac output.
4. Helps reduce potassium accumulation that occurs when sodium intake is high.

161. A client has surgery to repair a fractured right hip. Where should the nurse stand when assisting the client to ambulate?

1. Behind the client
2. In front of the client
3. On the client's left side
4. On the client's right side

162. A preschool-age child has been restricted to bed rest since admission to the hospital. As a response to improvement, the child becomes interested in playing. Based on the child's developmental level and activity restriction, what should the nurse provide?

1. Television viewing time
2. Squeaky stuffed animals
3. Small farm animals and a little barn

4. Simple three- or four-piece wooden puzzles

163. A newborn is Rh positive, and the mother is Rh negative. The infant is to receive an exchange transfusion. The nurse explains to the parents that their baby will receive Rh-negative blood because:

1. it is the same as the mother's blood.
2. it is neutral and will not react with the baby's blood.
3. the possibility of a transfusion reaction is eliminated.
4. the red blood cells will not be destroyed by maternal anti-Rh antibodies.

164. An emergency tracheotomy is performed on a child with acute epiglottitis, and the child is receiving humidified air via a tracheotomy collar. When caring for this child, what **early** clinical manifestations of hypoxia should alert the nurse to suction the tracheotomy?

1. Dyspnea and cyanosis
2. Agitation and diaphoresis
3. Restlessness and increase in pulse
4. Severe substernal retractions and stridor

165. A nurse is caring for a client with a spinal cord injury during the immediate postinjury period. What is the **primary** focus of nursing care during this immediate phase?

1. Inhibiting urinary tract infections
2. Preventing contractures and atrophy
3. Avoiding flexion or hyperextension of the spine
4. Preparing the client for vocational rehabilitation

166. Three days after birth, a breastfeeding newborn becomes jaundiced. The parents bring the infant to the clinic, and blood is drawn for an indirect serum bilirubin level. The test result is 12 mg/dL. The nurse explains that it is physiologic jaundice, a benign condition, which is caused by:

1. immature liver function.
2. an inability to synthesize bile.
3. an increased maternal hemoglobin level.
4. high hemoglobin with low hematocrit levels.

167. The parents of a newborn who is receiving phototherapy ask a nurse why their baby's eyes are covered with eye patches. What information should the nurse consider before responding?

1. They keep the eyes closed.
2. Overstimulation from bright lights is reduced.
3. They prevent injury to the conjunctiva and retina.
4. Excessive rapid eye movements and anxiety are limited.

168. A nurse is teaching sterile technique to a family member of a client who is to be discharged with a large abdominal wound that requires a dressing change twice a day. What does the family member do during a return demonstration that indicates further teaching is necessary?

1. Sets the sterile field on the client's linens at the foot of the bed.

2. Touches the outer inch of the sterile field when placing it on a flat surface.
  3. Checks expiration dates on the sterile packages before donning sterile gloves.
  4. Picks up wet gauze with sterile plastic forceps, holding the tips lower than the wrist.
169. An infant is diagnosed with hydrocephalus. Which assessment alerts the nurse to suspect increasing intracranial pressure?
1. Sunken eyes
  2. Projectile vomiting
  3. Depressed fontanel
  4. Narrowing pulse pressure
170. In the immediate postoperative period after a gastrectomy, the client's nasogastric tube is draining a light-red liquid. For how long should the nurse expect this type of drainage?
1. 1 to 2 hours
  2. 3 to 4 hours
  3. 10 to 12 hours
  4. 24 to 48 hours
171. Which complication is avoided when a nurse administers a parenteral preparation of potassium slowly and cautiously?
1. Acidosis
  2. Cardiac arrest
  3. Psychotic-like reactions
  4. Edema of the extremities
- 172. A nurse is assessing a male newborn. Which characteristics should alert the nurse to conclude that the newborn is a preterm infant? **Select all that apply.**
1. Wrinkled, thin skin
  2. Multiple sole creases
  3. Small breast bud size
  4. Presence of scrotal rugae
  5. Pinna remaining flat when folded
173. A nurse is caring for a client who is scheduled for a gastric bypass to treat morbid obesity. Which diet should the nurse teach the client to maintain because it will help minimize clinical manifestations of dumping syndrome?
1. Low-residue, bland diet
  2. Small, frequent feeding schedule
  3. Fluid intake less than half a quart
  4. Low-protein, high-carbohydrate diet
174. A nurse is caring for a client in the evening after the client has had a below-the-knee amputation. What action should be implemented by the nurse?
1. Elevate the foot of the bed.
  2. Assist the client out of bed to a chair.
  3. Have the client crutch walk in the room.
  4. Reapply the elastic bandage every two hours.
- 175. A pregnant client complains of constipation. Which strategies should the nurse

recommend? **Select all that apply.**

1. Exercise regularly.
2. Take a mild laxative before breakfast.
3. Drink at least one caffeinated beverage daily.
4. Add a few tablespoons of wheat bran to cereal at break-fast.
5. Plan to have a bowel movement at the same time every day.

176. A client with schizophrenia, paranoid type, is readmitted involuntarily to the hospital because family members state that he has threatened to harm them physically. When exploring feelings about the readmission, the client angrily shouts, "You're one of them. Leave me alone!" How should the nurse respond?

1. "Try not to be afraid. I will not hurt you."
2. "I can see you are upset. We can talk more later."
3. "I am not one of them, and I am here to help you."
4. "Your family and the staff are trying to help you."

177. Shortly after giving birth, a client says she feels that she is bleeding. When checking the fundus, a nurse observes a steady trickling of blood from the vagina. What is the nurse's **initial** action?

1. Call the health care provider.
2. Check the blood pressure and pulse.
3. Hold the fundus firmly and gently massage it.
4. Explain that the trickling blood is a common occurrence.

178. A postoperative client is diagnosed as having atelectasis. Which nursing assessment supports this diagnosis?

1. Productive cough
2. Clubbing of the fingertips
3. Crackles at the height of inhalation
4. Diminished breath sounds on auscultation

179. What is important nursing care for children with leukemia on chemotherapeutic protocols?

1. Preventing physical activity
2. Checking their vital signs every two hours
3. Having them avoid contact with infected persons
4. Reducing unnecessary stimuli in their environment

180. A client is receiving vinCRISine. What should the nurse expect the dietary plan to include to minimize the side effects of vinCRISine?

1. Low in fat
2. High in iron
3. High in fluids
4. Low in residue

181. A nurse is caring for a child with a very low platelet count related to chemotherapy. The nurse should monitor this child's urine for the presence of which constituent?

1. Protein
2. Glucose

3. Erythrocytes

4. Lymphocytes

182. The parents of a child with leukemia ask the nurse why irradiation of the spine and skull is necessary. What is the **most** accurate response by the nurse?

1. "Radiation retards growth of cells in bone marrow of the cranium."
2. "This therapy decreases cerebral edema, preventing increased intracranial pressure."
3. "Leukemic cells may invade the nervous system, but the usual drugs are ineffective in the brain."
4. "Neoplastic drug therapy without radiation is effective in most cases, but this is a precautionary treatment."

183. A nurse identifies that an older adult has not achieved the desired outcome from a prescribed proprietary medication. When assessing the situation, the client shares that the medication is too expensive and the prescription was never filled. What should the nurse do?

1. Ask the pharmacist to provide a generic form of the drug.
  2. Encourage the client to acquire the medication over the Internet.
  3. Inform the health care provider of the inability to afford the medication.
  4. Suggest that the client purchase insurance that covers prescription drugs.
184. During a routine prenatal visit, a client tells a nurse that she gets leg cramps. What condition does the nurse suspect and what suggestion is made to correct it?

1. Hypercalcemia and tells her to avoid eating hard cheeses
2. Hypocalcemia and tells her to increase her intake of milk
3. Hyperkalemia and tells her to consult with her health care provider
4. Hypokalemia and tells her to increase her intake of green, leafy vegetables

185. A health care provider prescribes simvastatin (Zocor) 20 mg daily for elevated cholesterol and triglyceride levels for a middle-age female. Which is **most** important for the nurse to teach the client to do when initially taking this medication?

1. Take the medication with breakfast.
2. Have liver function tests twice a year.
3. Wear sunscreen to prevent photosensitivity reactions.
4. Inform the health care provider if becoming pregnant is desired.

► 186. What gross motor skills should the nurse expect a developmentally appropriate 3-year-old child to perform? **Select all that apply.**

1. Skipping on alternate feet
2. Riding alone on a small bicycle
3. Standing on one foot for a few seconds
4. Alternating the feet when walking up stairs
5. Jumping rope by lifting both feet simultaneously

187. Methylphenidate (Ritalin) has been prescribed for a 7-year-old child with attention deficit/hyperactivity disorder (ADHD) to be taken with meals. What rationale should the nurse provide for the parents about the timing of medication administration?

1. Ritalin depresses the appetite.
2. This will ensure proper absorption.

3. It is an oral mucous membrane irritant.

4. Children tend to forget to take it before meals.

188. A client with acute respiratory distress syndrome is intubated and placed on a ventilator. What should the nurse do when caring for this client and the mechanical ventilator?

1. Regulate the PEEP according to the rate and depth of the client's respirations.
2. Deflate the cuff on the endotracheal tube for a few minutes every one to two hours.
3. Assess the need for suctioning when the high-pressure alarm of the ventilator is activated.
4. Adjust the temperature of fluid in the humidification chamber, depending on the volume of gas delivered.

189. A client who has had thoracic surgery is admitted to the postanesthesia care unit (PACU). What should the nurse do after the chest tube is attached to a disposable plastic waterseal drainage system?

1. Ensure the security of the connections from the client to the drainage unit.
2. Empty the drainage container and measure and record the amount once a day.
3. Verify that there is vigorous bubbling in the wet suction control compartment.
4. Check that the fluid level in the water seal compartment increases with expiration.

190. A client with schizophrenia has been experiencing hallucinations. During what client behaviors should the nurse expect the hallucinations to be more frequent?

1. Trying to rest
2. Playing sports
3. Watching television
4. Interacting with others

191. A client who had an organ transplant is receiving cycloSPORINE (Gengraf). For what should the nurse monitor to identify a serious adverse effect of cycloSPORINE?

1. Skin for hirsutism
2. Stools for constipation
3. Heart rhythm for dysrhythmias
4. Creatinine level for an increase

192. During the first prenatal visit of a woman who is at 23 weeks' gestation, the nurse discovers that the client has a history of pica. What is the **most** appropriate nursing action?

1. Seek a psychologic referral.
2. Explain the danger this poses to the fetus.
3. Obtain a prescription for an iron supplement.
4. Determine whether the diet is nutritionally adequate.

193. During a prenatal visit, a client at 36 weeks' gestation tells a nurse that she has painful, irregular contractions. What should the nurse recommend?

1. Lie down until they stop.
2. Time them for at least 1 hour.
3. Walk around until they subside.
4. Take 1 over-the-counter analgesic.

194. A health care provider prescribes losartan (Cozaar) for a client. Which is the **most** important nursing action?

1. Assess the client for hypokalemia.
2. Ensure that the medication is ingested with food.
3. Monitor the client's blood pressure during therapy.
4. Teach that a missed dose can be doubled at the next scheduled time.

195. During the postpartum period a nurse identifies that a client's rubella titer is negative. What action should the nurse plan to take?

1. Check for allergies to penicillin.
2. Alert the staff in the newborn nursery.
3. Assure the client that she has active immunity.
4. Obtain a prescription for an immunization before discharge.

196. An infant with hydrocephalus has a ventriculoperitoneal (VP) shunt surgically inserted. What nursing care is essential during the first 24 hours after this procedure?

1. Medicating the infant for pain
2. Placing the infant in a high-Fowler position
3. Positioning the infant on the side that has the shunt
4. Monitoring the infant for increasing intracranial pressure

197. An older adult is hospitalized for weight loss and dehydration because of nutritional deficits. What should the nurse consider when caring for this client?

1. Financial resources usually are unrelated to nutritional status.
2. An older adult's daily fluid intake must be markedly increased.
3. The client's diet should be high in carbohydrates and low in proteins.
4. The nutritional needs of an older adult are unchanged except for a decreased need for calories.

198. A health care provider orders peak and trough levels of an antibiotic for a client who is receiving vancomycin IV piggyback (IVPB). When should a blood sample be obtained to determine a peak level of the antibiotic?

1. Anytime it is convenient for the client
2. Between 30 and 60 minutes after a dose
3. Halfway between two doses of the drug
4. At 30 minutes before the medication is administered

199. A nurse is teaching a client who has arthritis about the steroid medication prescribed by the health care provider. Which client statement about why it is important to take steroid medication at mealtimes indicates that the teaching was effective?

1. "The presence of food will enhance the medication's absorption."
2. "Taking it with meals serves as a reminder to take the medication."
3. "Food will help decrease the gastric irritation effect of the medication."
4. "The acid medium in the presence of food makes the medication more effective."

200. What is the priority nursing intervention on admission of a primigravida in labor?

1. Monitoring the fetal heart rate
2. Asking the client when she ate last
3. Obtaining the client's health history

4. Determining if the membranes have ruptured

201. An external monitor is placed on the abdomen of a client admitted in active labor. The nurse identifies that during each contraction, the fetal heart rate decelerates as the contraction peaks. What should the nurse do next?

1. Help the client to a knee-chest position to avoid cord compression.
2. Notify the health care provider because of possible head compression.
3. Monitor the fetal heart rate until it returns to baseline when the contraction ends.
4. Place the client in a semi-Fowler position to prevent compression of the vena cava.

202. A nurse is caring for a client with the diagnosis of bulimia nervosa. The nurse understands that individuals with bulimia use food to:

1. gain attention.
2. control others.
3. avoid growing up.
4. meet emotional needs.

► 203. A nurse is admitting a client with a history of bipolar disorder. The nurse determines that the client is in the manic phase. Which signs and symptoms contribute to the nurse's conclusion? **Select all that apply.**

1. Irritability
2. Grandiosity
3. Pressured speech
4. Thought blocking
5. Psychomotor retardation

204. A client is admitted with a diagnosis of chronic adrenal insufficiency. When assigning a room, which roommate should be avoided because of the newly admitted client's condition?

1. Young adult client with pneumonia
2. Adolescent client with a fractured leg
3. Middle-age client who has cholecystitis
4. Older adult client who has had a brain attack

205. While on a hike, a rusty nail pierces the sole of an adolescent's foot and the adolescent is brought to the emergency department of a local hospital. Tetanus immune globulin is prescribed because the adolescent does not know when the last tetanus immunization was received. The nurse administers the prescribed dose of tetanus immune globulin and explains that it provides:

1. lifelong passive immunity.
2. long-lasting active protection.
3. immediate passive short-term immunity.
4. stimulation for the production of antibodies.

206. A nurse is caring for a client with Addison disease. What should the nurse teach the client to do regarding an appropriate diet?

1. Add extra salt to food.
2. Limit intake to 1200 calories.
3. Omit protein foods at each meal.

4. Restrict the daily intake of fluids to 1 liter.
207. What response should a nurse be particularly alert for when assessing a client for side effects of long-term cortisone therapy?
1. Hypoglycemia
  2. Severe anorexia
  3. Behavioral changes
  4. Anaphylactic shock
- 208. A nurse is caring for a 12-month-old infant with a diagnosis of failure to thrive. The infant's weight is below the third percentile, and development is delayed. Which behaviors of the child suggest to the nurse the possibility of parental neglect? **Select all that apply.**
1. Stiff
  2. Withdrawn
  3. Easily satisfied
  4. Minimal smiling
  5. Responsive to touch
  6. Little interest in the environment
209. A nurse observes that an infant has head control and can roll over but can neither sit up without support nor transfer an object from one hand to the other. What developmental age should the nurse estimate based on these observations?
1. 1 to 2 months
  2. 3 to 4 months
  3. 5 to 6 months
  4. 8 to 9 months
210. A health care provider prescribes milrinone (Primacor) for a client with a diagnosis of congestive heart failure who was unresponsive to conventional drug therapy. What is most important for the nurse to do **first**?
1. Administer the loading dose over ten minutes.
  2. Monitor the ECG continuously for dysrhythmias during infusion.
  3. Assess the heart rate and blood pressure continuously during infusion.
  4. Have the order, dosage calculations, and pump settings checked by a second nurse.
211. A nurse plans care for a client with a somatoform disorder based on the understanding that it is:
1. a physiologic response to stress.
  2. a conscious defense against anxiety.
  3. an intentional attempt to gain attention.
  4. an unconscious means of reducing stress.
212. During a group therapy session, some members accuse a client of intellectualizing to avoid discussing feelings. The client asks whether the nurse agrees with the others. What is the nurse's **best** response?
1. "It seems that way to me, too."
  2. "What is your perception of my behavior?"
  3. "Are you uncomfortable with what you were told?"

4. "I'd rather not give my personal opinion at this time."

► 213. A client who was in an automobile collision is admitted to the hospital with multiple injuries. Approximately 14 hours after admission, the client begins to experience signs and symptoms of withdrawal from alcohol. Which of these signs and symptoms should the nurse relate to alcohol withdrawal? **Select all that apply.**

1. Fatigue
2. Anxiety
3. Runny nose
4. Diaphoresis
5. Psychomotor agitation

214. A client is admitted to the postanesthesia care unit after an abdominal hysterectomy. Which assessment should the nurse report to the health care provider immediately?

1. Apical pulse of 90
2. Decreased urinary output
3. Increased drainage from the nasogastric tube
4. Serosanguineous drainage on the perineal pad 1 hour after surgery

215. A client rescued from a burning building has partial- and full-thickness burns over 40% of the body. Which is the initial physiologic change that the nurse can expect?

1. An increase in blood volume
2. An increase in serum potassium
3. A decrease in capillary permeability
4. A decrease in urinary specific gravity

216. A nurse is caring for a newly admitted client who has been diagnosed with bipolar disorder and has a history of hyperactivity and combativeness. Later in the evening, a commotion is heard, and this client is found hitting another client. What are the legal implications of this situation?

1. The client should have been placed in restraints on admission.
2. A client who is known to have been combative should have been kept sedated.
3. A client with bipolar disorder who is in contact with reality does not require supervision.
4. Because it was known that the client was frequently combative, close observation by the nursing staff was indicated.

217. While the nurse is talking to a hypermanic client, the client's conversation becomes vulgar. How should the nurse respond to the client's behavior?

1. Tactfully teasing the client about the use of such vulgarity
2. Restricting the client's contact with staff members until the behavior stops
3. Asking the client to limit the use of vulgarity while continuing the conversation
4. Discreetly refusing to talk to the client when the client is speaking in this manner

218. A nurse is teaching a 10-year-old child with type 1 diabetes about insulin requirements. When should the nurse explain that insulin needs will decrease?

1. Puberty is reached.
2. Infection is present.

3. Emotional stress occurs.
  4. Active exercise is performed.
- 219. A health care provider diagnoses that a client has acute cholecystitis with biliary colic. What clinical findings should the nurse expect when performing a health history and physical assessment? **Select all that apply.**
1. Diarrhea with black feces
  2. Intolerance to foods high in fat
  3. Vomiting of coffee-ground emesis
  4. Gnawing pain when the stomach is empty
  5. Pain in the upper right quadrant of the abdomen
220. On which concern should the nurse focus when caring for a client after abdominal surgery?
1. Identifying signs of bleeding
  2. Preventing pressure on the suture site
  3. Encouraging use of an incentive spirometer
  4. Detecting clinical manifestations of inflammation
221. A health care provider informs a client that a T-tube will be in place after an abdominal cholecystectomy and a choledochostomy. What should the nurse include in the preoperative teaching for this client regarding the **primary** reason why a T-tube is necessary?
1. Drains bile from the cystic duct.
  2. Keeps the common bile duct patent.
  3. Prevents abscess formation at the surgical site.
  4. Provides a port for contrast dye in a cholangiogram.
222. A nurse is assessing a client 8 hours after the creation of a colostomy. Which assessment finding should the nurse expect?
1. Presence of hyperactive bowel sounds
  2. Absence of drainage from the colostomy
  3. Dusky-colored, edematous-appearing stoma
  4. Red bloody drainage from the nasogastric tube
223. When admitting a client who is in labor to the birthing unit, a nurse asks the client about her marital status. The client refuses to answer and becomes very agitated, telling the nurse to leave. How should the nurse respond?
1. Question the family about the client's marital status.
  2. Try to obtain this information to complete the client's history.
  3. Refer the client to the social service department for counseling.
  4. Ask questions that are restricted to the client's present clinical situation.
224. A 5-week-old infant is admitted to the hospital with a tentative diagnosis of a congenital heart defect. The infant tires easily and has difficulty breathing and feeding. In what position should the nurse place this infant?
1. Supine with the knees flexed
  2. Orthopneic with pillows for support
  3. Side-lying with the upper body elevated

4. Prone with the head supported by pillows

► 225. Anorexia nervosa follows a cyclic pattern. List the following statements in order of progression through this cycle. Number 1 is the first step and number 5 is the fifth step in the cycle.

1. \_\_\_\_\_ Self-esteem increases as weight is lost.
2. \_\_\_\_\_ Dieting in an attempt to maintain control.
3. \_\_\_\_\_ Progressive deterioration in physical status
4. \_\_\_\_\_ Secondary gains reinforce the anorectic client's behaviors.
5. \_\_\_\_\_ Sociocultural attitudes exert pressure for people to attain an idealized body.

226. Three weeks after a kidney transplant, a client develops leukopenia. Which factor should the nurse conclude is the **most** probable cause of the leukopenia?

1. Bacterial infection
2. High creatinine levels
3. Rejection of the kidney
4. Antirejection medications

227. A nurse in the prenatal clinic is providing nutritional counseling for a pregnant woman with a cardiac problem. What should the nurse advise the client to do?

1. Limit the intake of fat.
2. Increase sodium in the diet.
3. Eat a moderate amount of protein.
4. Control the number of calories consumed.

228. A new father tells the nurse that he is anxious about not feeling like a father. What is the priority nursing action to meet this father's needs?

1. Encourage the father's participation in a parenting class.
2. Provide time for the father to be alone with and get to know the infant.
3. Offer the father a demonstration on newborn diapering, feeding, and bathing.
4. Allow time for the father to ask questions after viewing a film about a new infant.

229. On a 6-week postpartum visit, a new mother tells a nurse she wants to feed her baby whole milk after 2 months because she will be returning to work and can no longer breastfeed. The nurse plans to teach her that she should switch to formula feeding because whole milk does not meet the infant's nutritional requirements for which constituents?

1. Fat and calcium
2. Vitamin C and iron
3. Thiamine and sodium
4. Protein and carbohydrates

► 230. A nurse is caring for a client who is receiving a unit of packed RBCs. Which findings lead the nurse to suspect a transfusion reaction caused by incompatible blood?

**Select all that apply.**

1. Cyanosis
2. Backache
3. Shivering
4. Bradycardia

## 5. Hypertension

231. A client develops kidney damage as a result of a transfusion reaction. What is the **most** significant clinical response that the nurse should assess when determining kidney damage?

1. Glycosuria
2. Blood in the urine
3. Decreased urinary output
4. Acute pain over the kidney

► 232. A client is admitted to a medical unit with the diagnosis of acute kidney failure. The nurse reviews the client's laboratory data, performs a physical assessment, and obtains the client's vital signs. What should the nurse conclude the client is **most** likely experiencing?

### **Vital Signs**

Temperature: 98.8° F

Pulse: 78 beats per minute, irregular rhythm

Respirations: 20 breaths per minute

Blood pressure: 180/100 mm Hg

### **Client Interview: Client Reports**

Nausea

Diarrhea

Abdominal pain

Muscle weakness

### **Laboratory Results: Serum Electrolytes**

Potassium: 5.8 mEq/L

Sodium: 140 mEq/L

Calcium: 9.0 mg/dL

1. Hyperkalemia
2. Hyponatremia
3. Hypouricemia
4. Hypercalcemia

233. A nurse is caring for a client with chronic kidney failure. What should the nurse teach the client to limit the intake of to help control uremia associated with end-stage renal disease (ESRD)?

1. Fluid
2. Protein
3. Sodium
4. Potassium

234. What should the nurse do when caring for a client who is receiving peritoneal dialysis?

1. Maintain the client in the supine position during the procedure.
2. Position the client from side to side if fluid is not draining adequately.
3. Remove the cannula at the end of the procedure and apply a dry, sterile dressing.
4. Notify the health care provider if there is a deficit of 200 mL in the drainage return.

235. Children with special needs have the same needs as those without special needs, although their means of satisfying these needs may be limited. What effect should the nurse expect that these limitations will frequently cause in the child?

1. Frustration
2. Overcompensation
3. Feelings of rejection
4. Emotional dysfunction

236. A nurse assesses a client recently admitted to an alcohol-detoxification unit. What common clinical manifestation should the nurse expect during the initial stage of alcohol detoxification?

1. Nausea
2. Euphoria
3. Bradycardia
4. Hypotension

237. After an abdominal cholecystectomy, a client has a T-tube attached to a collection device. On the day of surgery, at 10:30 PM, 300 mL of bile is emptied from the collection bag. At 6:30 AM the next day, the bag contains 60 mL of bile. What should the nurse consider in response to this information?

1. The T-tube may have to be irrigated.
2. The bile is now draining into the duodenum.
3. Mechanical problems may have developed with the T-tube.
4. Suction must be reestablished in the portable drainage system.

238. A nurse in the emergency department is assessing a client who was beaten and sexually assaulted. Which is the nurse's priority assessment?

1. The family's feelings about the attack
2. The client's feelings of social isolation
3. Disturbance in the client's thought processes
4. The client's ability to cope with the situation

239. A health care provider orders oxygen therapy via nasal cannula at 2 L/min for an older, confused client with heart failure. Which nursing action is the priority?

1. Maintaining the client on bed rest
2. Determining whether the client is agitated
3. Obtaining a cannula of appropriate size for the client
4. Investigating whether the client has chronic obstructive pulmonary disease

240. A health care provider orders oropharyngeal suctioning as needed for a client in a coma. Which assessment made by the nurse indicates the need for suctioning?

1. Gurgling sounds with each breath

2. Fine crackles at the base of the lungs
  3. Cyanosis in the nail beds of the fingers
  4. Dry cough at increasingly frequent intervals
241. A parent of three young children has contracted tuberculosis. Which should the nurse expect the health care provider to prescribe for members of the family who have a positive reaction to the tuberculin skin test and are candidates for treatment?
1. Isoniazid (INH)
  2. Multiple puncture tests (MPTs)
  3. Bacille Calmette-Guérin (BCG)
  4. Purified protein derivative (PPD)
242. A nurse is caring for a client with a diagnosis of varicose veins. Which clinical findings can the nurse expect to identify when assessing this client? **Select all that apply.**
1. Discolored toenails
  2. Reports of leg fatigue
  3. Localized heat in a calf
  4. Reddened areas on a leg
  5. Tortuous veins in the legs
  6. Pain in lower extremities when standing
243. A client is diagnosed with varicose veins, and the nurse teaches the client about the pathophysiology associated with this disorder. The client asks, "What can I do to help myself?" What should the nurse respond?
1. "Limit walking to as little as possible."
  2. "Reduce fluid intake to one liter of liquid a day."
  3. "Apply moisturizing lotion on your legs several times a day."
  4. "Put on compression hose before getting out of bed in the morning."
244. A nurse is caring for a newly admitted client with anorexia nervosa. What is the **priority** treatment for the client at this time?
1. Medications to reduce anxiety
  2. Family psychotherapy sessions
  3. Separation from family members
  4. Correction of electrolyte imbalances
245. A client with acquired immunodeficiency syndrome (AIDS) is receiving a treatment protocol that includes a protease inhibitor. When assessing the client's response to this drug, which common side effect should the nurse expect?
1. Diarrhea
  2. Hypoglycemia
  3. Paresthesias of the extremities
  4. Seeing yellow halos around lights
246. A nurse teaches a client about warfarin (Coumadin). Which juice to avoid identified by the client indicates that the teaching is effective?
1. Apple juice
  2. Grape juice
  3. Orange juice

4. Cranberry juice

247. Medication is prescribed for a 7-year-old child with attention deficit hyperactivity disorder (ADHD). What information should the school nurse emphasize when discussing this child's treatment with the parents?

1. Tutor their child in the subjects that are troublesome.
2. Monitor the effects of the drug on their child's behavior.
3. Explain to their child that the behavior can be controlled if desired.
4. Avoid imposing too many rules because these will frustrate the child.

248. A nurse performs preoperative teaching for a client who is to have cataract surgery. Which is **most** important for the nurse to include concerning what the client should do after surgery?

1. Remain flat for 3 hours.
2. Eat a soft diet for 2 days.
3. Breathe and cough deeply.
4. Avoid bending from the waist.

249. A nurse is supervising a recently hired nursing assistant who is caring for a debilitated, bedbound client. What intervention being implemented necessitates the nurse to intervene?

1. Draining the client's urinary collection bag into a measuring container
2. Taking the client's blood pressure with an electronic sphygmomanometer
3. Removing boots that kept the client's feet in dorsiflexion before giving a bath
4. Replacing a dressing on the client's buttocks that was contaminated with fecal material

250. A client is receiving epoetin (Epogen) for the treatment of anemia associated with chronic renal failure. Which client statement indicates to the nurse that further teaching about this medication is necessary?

1. "I realize it is important to take this medication because it will cure my anemia."
2. "I know many ways to protect myself from injury because I am at risk for seizures."
3. "I recognize that I may still need blood transfusions if my blood values are very low."
4. "I understand that I will still have to take supplemental iron therapy with this medication."

► 251. A health care provider diagnoses that a  $2\frac{1}{2}$ -year-old child has acute nonlymphoid leukemia. The child is admitted to the hospital. What clinical manifestations of the disease should the nurse expect when assessing the child? **Select all that apply.**

1. Anorexia
2. Petechiae
3. Irritability
4. Skin pallor
5. Listlessness

252. A 7-year-old child with juvenile idiopathic arthritis has difficulty getting ready for school in the morning because of joint pain and stiffness. Which recommendation should the nurse make to the family?

1. Administer acetaminophen before bedtime.
2. Ice the joints that are painful in the evening.

3. Encourage a program of active exercise after awakening.
  4. Provide warm, moist heat to the affected joints before arising.
253. A client has just had a suprapubic prostatectomy. Which action should the nurse implement to prevent a secondary bladder infection?
1. Observe for signs of uremia.
  2. Attach the catheter to suction.
  3. Clamp off the connecting tube.
  4. Change the dressings frequently.
- 254. A client who weighs 176 pounds is being immunosuppressed by daily maintenance doses of cycloSPORINE (Sandimmune) to prevent organ transplant rejection. The dose prescribed is 8 mg/kg each day. How many milligrams should the nurse administer each day? **Record your answer using a whole number.**
- Answer: \_\_\_\_\_ mg
255. A nurse is discussing weight loss with an obese individual with Ménière's disease. Which suggestion by the nurse is **most** important?
1. Limit intake to nine hundred calories a day.
  2. Enroll in an exercise class at the local high school.
  3. Get involved in diversionary activities when there is an urge to eat.
  4. Keep a diary of all foods eaten each day, making certain to list everything.
256. A 3-year-old child is to receive a liquid iron preparation. What should the nurse teach the mother in relation to this medication?
1. Monitor stools for the occurrence of diarrhea.
  2. Administer the iron at least an hour before meals.
  3. Avoid giving the child orange juice with the iron solution.
  4. Have the child drink the diluted iron preparation through a straw.
257. A health care provider prescribes selegiline (Eldepryl) 5 mg twice a day for a client with a diagnosis of Parkinson disease. What is **most** important for the nurse to teach the client?
1. Eat food high in tyramine.
  2. Ensure that an opioid is not taken currently.
  3. Take the medication in the morning and evening.
  4. Monitor for signs of hypoglycemia and hyperglycemia.
258. A child with  $\beta$ -Thalassemia is receiving therapy that includes multiple blood transfusions. This child is at risk for developing which complication?
1. Serum hepatitis
  2. Allergic response
  3. Pulmonary edema
  4. Hemolytic reaction
259. A school nurse knows that many children with attention deficit problems may be learning disabled. The nurse should teach the parents that a child with a learning deficit will:
1. probably not be self-sufficient as an adult.
  2. have intellectual deficits that interfere with learning.

3. usually perform two grade levels below their age norm.
  4. experience perceptual difficulties that make learning problematic.
260. A nurse is evaluating the practice of a home health aide who is caring for a client who has paraplegia. Which action by the home health aide indicates understanding about the nursing team's responsibility in relation to pressure ulcers?
1. Inspecting the skin daily
  2. Providing a rubber cushion on which to sit
  3. Massaging body lotion over reddened areas
  4. Applying a heating pad to bony prominences
261. A client exhibits physical symptoms in response to stress. What nursing intervention may assist the client to reduce the use of physical symptoms as a response to stress?
1. Limit discussions about the problem.
  2. Provide information regarding medical care.
  3. Teach the client how to eliminate stress at home.
  4. Assist the client in developing new coping mechanisms.
262. When assessing the oral cavity of a newly admitted client with acquired immunodeficiency syndrome (AIDS), the nurse identifies areas of white plaque on the client's tongue and palate. What is the nurse's **initial** response?
1. Scrape an area of one of the lesions and send the specimen for a biopsy.
  2. Instruct the client to perform meticulous oral hygiene at least once daily.
  3. Document the presence of the lesions, describing their size, location, and color.
  4. Consider that these lesions are universally found in clients with AIDS and require no treatment.
263. Three days after surgery for cancer of the colon, a nurse introduces the client to colostomy care. Which should the nurse teach the client about skin care around the stoma?
1. Apply liberal amounts of an oil-based ointment around the stoma.
  2. Rinse the area with peroxide before applying fresh gauze bandages.
  3. Pour saline over the stoma and rub the area to remove hard fecal matter.
  4. Wash the area with soap and water and then apply a protective ointment.
264. Before discharge, a client with a colostomy questions the nurse about resuming prior activities. What is the nurse's **best** response?
1. "Most sports activities, except for swimming, can be resumed based on your overall physical condition."
  2. "With counseling and medical guidance, a near normal lifestyle, including complete sexual function, is possible."
  3. "Activities of daily living should be resumed as quickly as possible to avoid depression and further dependency."
  4. "After surgery, changes in lifestyle must be made to accommodate the physiologic changes caused by the surgery."
265. After surgical clipping of a cerebral aneurysm, the client develops the syndrome of inappropriate secretion of antidiuretic hormone. For which manifestation of excessive

levels of antidiuretic hormone (ADH) should the nurse assess?

1. Decreased urine output
2. Decreased urine specific gravity
3. Increased serum sodium level
4. Increased blood urea nitrogen

## Answers and Rationales: Part A

---

**1. 3 Capillary refill based on the blanch test is an accurate assessment for neurovascular integrity; immediate refill is expected.**

**1** Palpation of the pedal pulse, which is distal to the injury, is more appropriate than palpation of the femoral artery. **2** The pain associated with Homan sign indicates thrombophlebitis, not compromise of blood flow or innervation. **4** Flexion and extension of the affected knee is impossible with this cast.

**Reference:** Ch 11, Fractures of the Extremities, Nursing Care

**2. Answer: 1, 5, 6.**

**1** Obesity is a risk factor for endometrial cancer because adipose cells store estrogen; the extent of exposure to estrogen is the most significant risk factor. **2** Nulliparity, not multiparity, is a risk factor for endometrial cancer because of the increased exposure to estrogen. **3** Cigarette smoking is not identified as a risk factor for endometrial cancer. **4** Late, not early, onset of menopause is a risk factor for endometrial cancer because of the increased exposure to estrogen. **5** Although endometrial cancer has not been proven to have a genetic predisposition, it is more common in families who have gene mutations for hereditary nonpolyposis colon cancer (HNPCC). **6** Endometrial cancer has a relationship with exposure to estrogen.

**Reference:** Ch 24, Uterine Neoplasms, Data Base

**3. 1 Radiation is damaging to the skin and may cause it to become sensitive and friable.**

**2** A radiated site should be cleaned only with water. **3** This is contraindicated; lotion may contain compounds that alter the direction of x-rays. **4** A snug-fitting bra can irritate delicate, irradiated skin and should be avoided until the irradiated area heals.

**Reference:** Ch 3, Radiation, Major Side Effects

**4. 4 The client is experiencing the Somogyi effect. It is a paradoxical situation in which sudden decreases in blood glucose are followed by rebound hyperglycemia. The body responds to the hypoglycemia by secreting glucagon, epinephrine, growth hormone, and cortisol to counteract the low blood sugar. This results in an excessive increase in the blood glucose level. It most often occurs in response to hypoglycemia when asleep. The health care provider may choose to decrease the insulin dose and then reassess the client.**

**1** This will further increase the serum glucose level and is contraindicated. **2** Increasing the insulin dose at bedtime will further worsen the problem. **3** This will not address the hypoglycemia and rebound hyperglycemia that occurs when sleeping. However, a bedtime snack may help minimize this event.

**Reference:** Ch 9, Diabetes Mellitus, Data Base

**5. 2 Since the legal difficulties were a precipitating event for hospitalization, if the client can realistically examine the possible outcomes of the trial, then some benefit has been gained from the therapy.**

**1** The client has been freely expressing resentment and victimization by the employer and authority figures; this does not show improvement or insight. **3** The client has been discussing problems since admission, so this does not indicate the development of insight. **4** This indicates unrealistic planning and does not demonstrate the development of insight.

**Reference:** Ch 20, Personality Disorders, Nursing Care

**6. 2 This client can become eclamptic suddenly and have a seizure; seizure precautions are necessary to protect her from injuring herself and the fetus.**

**1** This is important, but the client's safety should be ensured first. **3** Administering sedatives will help to reduce nervous system irritability; it will not ensure safety if the client has a seizure. **4** This will be required when the client is placed on magnesium sulfate therapy.

**Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

**7. 1 The client needs further teaching; dietetic fruit is not sugar-free and must be calculated in the diet of an individual with diabetes.**

**2** Lettuce is considered a free food in the diet of a person with diabetes. **3** It is suggested that the caloric intake of a person with diabetes should be 50% carbohydrate, 20% protein, and 30% fat. **4** Saturated fats should be limited to 10% of the fat intake; 90% of fat should be unsaturated fats.

**Reference:** Ch 9, Diabetes Mellitus, Data Base

**8. 2 Although dust cannot be avoided completely, use of a damp cloth helps eliminate the quantity of airborne particles that might be inhaled.**

**1** This is unnecessary and unrealistic. **3** There are ways to limit the quantity of airborne particles. **4** Redecorating will not eliminate dust; it is part of our environment.

**Reference:** Ch 32, Asthma, Nursing Care

**9. 1 Restlessness or the desire to keep moving (akathisia) can occur within 6 hours of the first dose of Haldol. This side effect is associated with most neuroleptics.**

**2** Parkinsonian side effects include masklike facies, tremors, and shuffling gait. **3** This severe, largely irreversible, extrapyramidal side effect occurs after prolonged treatment with phenothiazines. **4** Acute dystonic reaction is characterized by severe, bizarre muscle contractions.

**Reference:** Ch 16, Antipsychotic Agents, Precautions

**10. 3 Discussing reality-based issues helps decrease delusional and hallucinatory activity by reducing feelings of isolation and competition for sensory awareness.**

**1, 2** This will support and reinforce delusions and tend to validate them. **4** This is a judgmental response that may decrease the client's trust and increase anxiety.

**Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**11. 4 This, together with observation and documentation of the seizure activity, is the primary nursing care for a client with a tonic-clonic seizure.**

**1** The client should not be left unattended. **2** This is done after the seizure; the mouth should not be pried open to insert an airway during a seizure because injury may occur. **3** This will assist with establishing an airway after the seizure, but it is an unsafe action during a seizure.

**Reference:** Ch 11, Epilepsy, Nursing Care

**12. 1 The client controls anxiety by maintaining a childlike body build and by demonstrating mastery over food intake.**

**2** Families of people with anorexia usually are fused, so separation from parents is not a desirable gain. **3** People with anorexia generally excel in academic areas and receive attention and praise as the perfect child; they will not gain from having this source of attention removed. **4** Maintenance of control, not the resulting overattention of parents, is the primary gain.

**Reference:** Ch 20, Eating Disorders, Overview

**13. 3 This is done to prevent drying and breakage of the sac; any opening increases the risk for infection to the central nervous system.**

**1** Diapering is contraindicated until the defect is repaired; the diaper may irritate the sac and cause rupture, predisposing to infection. **2** The infant generally is placed in a neutral position to reduce pressure on the affected area. **4** The legs are abducted to counteract subluxation, since the infant is unable to move the legs.

**Reference:** Ch 30, Defects of Neural Tube Closure, Nursing Care

**14. Answer: 1, 2, 3, 4, 5.**

**1** Discontinuing the oxytocin (Pitocin) infusion lessens uterine stimulation and decreases intrauterine pressure; continuing the oxytocin may lead to fetal hypoxia, placental separation, or uterine rupture. **2** Turning the client onto the side increases oxygen perfusion to the fetus. **3** The health care provider should be notified to obtain additional orders. **4** Contractions lasting longer than 90 seconds warrant stopping the oxytocin infusion to prevent uterine rupture. **5** Oxygen administration will increase oxygen to the placenta and fetus.

**Reference:** Ch 25, Intrapartum Period, Data Base

**15. 1 This is the appropriate breathing technique for the transition phase; it prevents the client from pushing too early.**

**2** The client is not fully dilated and is not ready to give birth. **3** The client is in active labor; she should be offered a bedpan if she requests to go to the bathroom. **4** Butorphanol (Stadol) should not be administered in this phase of labor because the peak of action lasts up to 1 hour and the duration is 1 to 3 hours; the infant may be born with respiratory depression.

**Reference:** Ch 25, Intrapartum Period, Nursing Care

**16. 4 Vitamin K prevents hemorrhagic disease of the newborn because it activates coagulation factors in the liver. Intestinal flora, which synthesizes vitamin K, is absent in the newborn because the GI tract is sterile. With feeding and adaptation to the environment, intestinal flora becomes established.**

**1** The intestinal tract of the newborn is considered sterile. **2** Vitamin K substitutes for the action of intestinal flora. **3** Vitamin K does not stimulate further production of this

vitamin; eventually, the bacterial flora of the intestine stimulates the production of vitamin K.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Adaptation to Extrauterine Life

**17. 4 Applesauce provides nutrition without large additional amounts of potassium and sodium.**

**1** Peanuts are high in sodium, which increases fluid retention. **2** Pretzels are high in sodium, which increases fluid retention. **3** Bananas are high in potassium, which is contraindicated.

**Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Data Base

**18. 1 The presence of fat in the duodenum stimulates painful contractions of the gallbladder to release bile; fat intake should be restricted.**

**2** Carbohydrates do not have to be restricted. **3** A reduction in spices and bulk is not necessary. **4** Although this diet might be desirable as long as the protein is not high in saturated fat, a high-calorie diet generally is not ordered.

**Reference:** Ch 8, Cholelithiasis/Cholecystitis, Data Base

**19. 2 Decreasing urinary output indicates hypovolemia that results from a fluid shift from the vascular space to the burned area.**

**1, 3, 4** This is expected with deep partial-thickness burns.

**Reference:** Ch 10, Burns, Data Base

**20. 3 The development of insight is impeded by the client's unwillingness or inability to face his own contribution to a problem.**

**1** These will not impede the development of insight. These feelings are common in clients with borderline personality disorders. **2** This will not impede the development of insight. Grandiosity is often a cover for feelings of inadequacy, which are threatening to the client; these feelings usually disappear with insight. **4** This will not impede the development of insight. It is not the anger itself but how the anger contributes to interpersonal difficulty that the client must recognize.

**Reference:** Ch 15, Anxiety and Coping Behaviors, Defense Mechanisms

**21. Answer: 1, 4.**

**1** Clients with borderline personality disorders initially tend to be engaging and to establish intense relationships. **2** These clients often are decisive and opinionated. **3** These clients have a pronounced intolerance for being alone and usually are quite social. **4** These clients may be manipulative because they are opinionated and they want people to conform to their agenda. **5** These clients are not perfectionists.

**Reference:** Ch 20, Personality Disorders, Data Base

**22. 3 A closed, sterile drainage system reduces the likelihood that microorganisms will be introduced into the bladder.**

**1** The bag usually is emptied according to hospital protocol or if it becomes full. **2** Tension on the tubing should be avoided because this may injure the mucous membranes of the urinary tract. **4** This is unsafe because if the side rail is put down abruptly, it may pull out the catheter.

**Reference:** Ch 12, Related Procedures, Urinary Catheterization

**23. 2 Serum creatinine concentration measures the kidney's ability to excrete metabolic wastes. Creatinine, a nitrogenous product of protein breakdown, is increased with renal insufficiency.**

**1** This test is more valuable for assessing structure than function. **3** WBC count does not measure kidney function; WBCs usually are depressed because of immunosuppressive therapy to prevent rejection. **4** Although this should be considered, it is not as definitive as the serum creatinine level.

**Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Disease, Nursing Care

**24. 4 The diet does not reflect a healthy diet with a variety of foods, especially protein; adequate nutrition is necessary for the birth of a healthy full-term infant whose weight is appropriate for gestational age.**

**1** The caloric content of these foods is not high if small amounts are consumed; in addition, this client's weight gain may not be reflective of an adequate weight gain in the developing fetus. **2** No data are available to support this. **3** Unrestricted salt intake does not contribute to the development of gestational hypertension.

**Reference:** Ch 25, Prenatal Period, Physical, Physiological, and Emotional Changes during Pregnancy

**25. 1 The client has severe preeclampsia, which develops suddenly with a blood pressure of 160/110 or higher and proteinuria of +2 to +3 or more. Severe headache and blurred vision are typical symptoms. The client needs immediate treatment to prevent eclampsia.**

**2, 4** There is no time to obtain or administer medication. This is an emergency situation. **3** This is unsafe and places both client and fetus in jeopardy.

**Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**26. 3 The caloric intake should be 150% to 200% more than the expected intake for size and age, because absorption of fats and nutrients is compromised by the disease process.**

**1** Fluids are encouraged to keep bronchial secretions from becoming too thick and tenacious. **2** Salt is added to the diet to compensate for excessive sodium losses in saliva and perspiration. **4** Whole milk may not be tolerated because of its high fat content; skim milk products should be substituted.

**Reference:** Ch 31, Cystic Fibrosis, Data Base

**27. 2 Retinal damage caused by the increased intraocular pressure of glaucoma is progressive and permanent if the disease is not controlled.**

**1** Early treatment may prevent blindness. **3** One eye may be affected, and there is no restriction on the use of either eye. **4** Surgery can open up drainage and permanently reduce pressure.

**Reference:** Ch 11, Glaucoma, Data Base

**28. 4 The client usually is instructed to do this to toughen the limb for weight-bearing. This process is begun by pushing the residual limb against increasingly harder surfaces.**

**1** Abduction of the residual limb does not maintain functional alignment and should be avoided; it does not prepare the end of the residual limb for a prosthesis. **2** Dangling the residual limb does not help prepare it for a prosthesis and may impede venous

return, which prolongs healing. **3** This may macerate the residual limb and hinder the use of a prosthesis.

**Reference:** Ch 11, Amputation, Nursing Care

**29. 2 Asthma involves spasms of the bronchi and bronchioles, as well as increased production of mucus. This decreases the size of the lumina, interfering with inhalation and exhalation. Bronchiolar dilation will reduce airway resistance and improve the client's breathing.**

**1** Although identifying and addressing a client's emotional state are important, maintaining airway and breathing are the priority. In addition, emotional stress is only one of many precipitating factors, which include allergens, temperature changes, odors, and chemicals. **3** Although recent studies indicate a genetic correlation along with other factors that may predispose a person to develop asthma, exploring this issue is not the priority. **4** Use of an incentive spirometer is not helpful because of mucosal edema, bronchoconstriction, and secretions, all of which cause airway obstruction.

**Reference:** Ch 7, Obstructive Airway Diseases, Data Base

**30. 3 During sleep, mucous secretions in the respiratory tract move slowly toward the throat. On awakening, increased ciliary motion raises these secretions more vigorously, thus facilitating expectoration and the collection of sputum specimens.**

**1** Although activity mobilizes secretions, no secretions may be present at the time of activity; sputum is most plentiful upon arising. **2** The sputum may leave an unpleasant taste in the mouth, which may interfere with appetite. **4** Sputum more likely would be collected after, not before, a respiratory treatment, because this mobilizes secretions.

**Reference:** Ch 7, Pneumonia, Nursing Care

**31. 3 Confused clients find comfort and security in an environment that provides realistic limits and controls because this reduces the need for self-regulation.**

**1** No environment can meet all of any client's needs. **2** This may be confusing and may precipitate anxiety. **4** This provides for physical, not psychologic, safety.

**Reference:** Ch 18, Dementia, Nursing Care

**32. 1 Inadequate oxygenation of the brain may produce restlessness or behavioral changes.**

**2** The pulse increases with cerebral hypoxia. **3** The pupils dilate with cerebral hypoxia. **4** This is the result of increased vascularization and reflects a response to prolonged hypoxia.

**Reference:** Ch 3, Perioperative Care, General Nursing Care of Clients during the Postoperative Period

**33. Answer: 1, 3, 4, 5.**

**1** Fever is a common finding with acute laryngotracheobronchitis. **2** Crackles are not characteristic of acute laryngotracheobronchitis. **3** Hoarseness is caused by edema of the mucosa of the larynx. **4** The cough is tight, with a barking, metallic sound due to laryngeal edema. **5** Children with acute laryngotracheobronchitis experience inspiratory stridor because of laryngeal edema.

**Reference:** Ch 30, Respiratory Tract Infections, Data Base

**34. 2 Administering the incorrect dose would be an act of negligence that may endanger the client, and the nurse would be liable. If the dosage is not changed after the health care provider is questioned, the nurse should contact the nurse manager.**

**1, 3** The dose should be withheld because it may result in respiratory depression and may endanger both the client and fetus. Also, the nurse is at risk for negligence. **4** The nurse should follow hospital protocol and notify the nurse manager first.

**Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**35. Answer: 1, 2, 4.**

**1** Increased maternal oxygenation increases oxygen available for the fetus. **2** The side-lying position decreases cord compression, which improves circulation to the fetus. **3** This may compromise the mother and fetus. **4** This will decrease uterine activity. Five contractions in 8 minutes does not allow enough time for uterine relaxation and reperfusion between contractions. **5** There is no infection present and no reason for an antibiotic to be administered.

**Reference:** Ch 25, Intrapartum Period, Data Base

**36. 2 Cerebral edema from hypertension or cerebral ischemia may occur, which may cause seizures.**

**1** Increasing fluid intake may lead to an increase in blood pressure and edema. **3** This is appropriate for children with nephrotic syndrome, in which the child has hypoalbuminemia that causes fluid to shift from plasma to the abdominal cavity. **4** Glomerulonephritis will not alter pupillary reactions.

**Reference:** Ch 33, Acute Post Streptococcal Glomerulonephritis, Nursing Care

**37. 1 Too much ingestion of alcohol can cause scarring and fibrosis of the liver. Eighty-five to 95 percent of acetaminophen (Tylenol) is metabolized by the liver.**

**Acetaminophen and alcohol are both hepatotoxic substances. Metabolites of acetaminophen along with alcohol can cause irreversible liver damage.**

**2** Caffeine affects (stimulates) the cardiovascular system, not the liver. In addition, caffeine does not interact with acetaminophen. **3** Saw palmetto is not associated with increased liver damage when taking acetaminophen. It is often taken for benign prostatic hypertrophy because of its antiinflammatory and antiproliferative properties in prostate tissue. **4** St. John's wort is classified as an antidepressant and is not associated with increased liver damage when taking acetaminophen. However, it does decrease the effectiveness of acetaminophen.

**Reference:** Ch 3, Pain, Related Pharmacology, Other Nonopioid Analgesics

**38. 4 Children at early school age are not yet able to comprehend death's universality and inevitability; they fear it, often personifying death as a "bogeyman" or "death angel." They need an opportunity to prepare for this.**

**1** A child this age needs to know the seriousness of the illness and that recovery may not be possible. **2** Children of this age interpret death as separation and punishment; they fear this, in addition to death itself. **3** This response only avoids the question.

**Reference:** Ch 33, Hospitalization of School-Age Children, Data Base

**39. Answer: 1, 5.**

**1** Fatigue occurs because inadequate nutritional intake results in electrolyte imbalances

and decreased RBCs. **2** Many of these clients have lowered body temperature. **3** These clients have bradycardia. **4** These clients are cold intolerant. **5** Amenorrhea occurs because of endocrine imbalances resulting from starvation; it is thought that severe starvation damages the hypothalamus.

**Reference:** Ch 20, Anorexia Nervosa, Data Base

**40. 4 This approach allows the client to control the pace of development of the nurse-client relationship.**

**1** Depressed clients are unable to move into relationships with other clients. **2** It is too early for therapy sessions; the first thing that must be established is a trusting nurse-client relationship. **3** Depressed clients are unable to move into group situations.

**Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**41. 1 An increased amount of the human chorionic gonadotropin (hCG) hormone may cause nausea and vomiting during the first trimester; the stomach should be neither too full nor too empty. Small, more frequent meals usually relieve the nausea.**

**2** This will not help the nausea and vomiting associated with the first trimester of pregnancy and should not be taken without a prescription; it may be prescribed during the second trimester when pyrosis and acid indigestion occur because progesterone slows GI tract motility. **3** This is not a treatment for nausea. **4** Over-the-counter (OTC) medications are contraindicated during pregnancy, especially during the first trimester, the period of organogenesis. The health care provider should be consulted before taking any medications during pregnancy.

**Reference:** Ch 25, Prenatal Period, Physical, Physiological, and Emotional Changes during Pregnancy

**42. 1 Chronic obstructive pulmonary disease (COPD) causes increased pressure in the pulmonary circulation. The right side of the heart hypertrophies (cor pulmonale), causing right ventricular heart failure.**

**2** The skeletal system is not directly related to the pulmonary system; joint inflammation does not occur because of COPD. **3** This system is not as closely related to the pulmonary system as is the cardiac system; kidney problems usually do not occur because of COPD. **4** Peripheral neuropathy does not occur because of COPD.

**Reference:** Ch 7, Obstructive Airway Diseases, Data Base

**43. 3 This is done instead of immersing the baby in a tub of water because the moisture may retard drying of the cord stump and may delay its falling off; the cord usually falls off by 1 to 3 weeks. Evidence-based practice research presently is being conducted to determine whether tub baths should be permitted.**

**1** Drainage is indicative of infection; the cord stump should be dry. **2** Drying is desirable; moisture slows the drying process and promotes bacterial growth. **4** Keeping the cord stump covered delays drying.

**Reference:** Ch 27, Adaptation to Extrauterine Life, Nursing Care Common to All Newborns

**44. 2 This action does not require a health care provider's order and is an independent action.**

**1, 3, 4** This is a dependent nursing function, which requires a health care provider's

order.

**Reference:** Ch 7, Malignant Lung Tumors, Nursing Care

**45. 1 This open-ended statement focuses on the client's concerns and allows further verbalization of feelings.**

**2, 4** This moves the focus away from the client and minimizes the client's concerns. **3** Although true, this response may increase anxiety and may cut off communication.

**Reference:** Ch 12, Bladder Tumors, Nursing Care

**46. 4 The concept of object permanence begins to develop at about 6 months of age because of brain development and experience.**

**1, 2** This occurs between 13 and 24 months. **3** This occurs during the first several months of life. These diminish as the newborn grows.

**Reference:** Ch 30, Health Promotion of Infants, Play

**47. 1 Because electrodes are placed internally (on the fetal scalp, not on the mother's abdomen), position does not affect the monitor. The side-lying position is recommended because it promotes maternal-fetal circulation, but it is not essential for accurate internal fetal monitoring.**

**2** It is not the position but the internal placement of electrodes on the fetal scalp that ensures accurate monitoring. **3** Constant monitoring provides continuous ongoing assessment of fetal status; there is no reason to detach the leads. **4** Although this position does not affect the monitor, it should be discouraged because the gravid uterus causes decreased venous return, leading to reduced cardiac output.

**Reference:** Ch 25, Intrapartum Period, Nursing Care

**48. 1 According to the Silverman-Anderson Index for respiratory function, flaring of the nares indicates respiratory distress; it is a compensatory mechanism to increase the intake of air.**

**2** The heart rate of a newborn in respiratory distress usually remains within the norm of 100 to 160 beats/min. **3** These are expected in the neonate; respiratory function is largely a matter of diaphragmatic contraction; expansion of the rib cage is limited in the neonate. **4** The respiratory rate of a newborn in respiratory distress is rapid, more than 60/min. The expected respiratory rate for neonates ranges between 30 and 60 breaths/min.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Nursing Care  
Common to All Newborns

**49. 4 This occurs prior to lactation; it is an exaggeration of venous and lymphatic circulation caused by prolactin.**

**1** Engorgement occurs before lactation or milk production. **2** Effective breastfeeding does not prevent engorgement; a lag between the production of milk and the efficiency of the ejection reflex often causes engorgement. **3** This does not cause engorgement, but support may relieve some of the discomfort.

**Reference:** Ch 25, Postpartum Period, Data Base

**50. 1 This will decrease edema and minimize pain.**

**2** Dry dressings, when removed, may further damage the burn site. **3** Although pain is

temporarily alleviated, removal of the spray is necessary before further treatment can be instituted; removal may cause injury. **4** Ointments are contraindicated on burns because they have an oil base.

**Reference:** [Ch 10](#), Burns, Nursing Care

**51. 3 This is limited hip abduction and is indicative of developmental dysplasia of the hip.**

**1** This is an expected newborn reflex. **2** This is an expected measurement for a newborn at term. **4** This is an expected finding.

**Reference:** [Ch 30](#), Developmental Dysplasia of the Hip, Data Base

**52. 4 Although older adults may be faced with multiple stressors as they age, how people cope with stress remains fairly constant throughout life.**

**1** Decreases in the senses of taste and smell are noted as people age. **2** GI motility decreases slightly with aging; sedentary lifestyles and lack of dietary fiber compound the problem. **3** Muscle strength decreases with aging.

**Reference:** [Ch 15](#), Anxiety and Coping Behaviors, Overview

**53. Answer: 2, 1, 3, 4, 5.**

**2** The initial response is shock, disbelief, and denial, and the client seeks additional opinions to negate the diagnosis. **1** When negating the diagnosis is unsuccessful, the client becomes angry and negative. **3** Bargaining for wellness follows in an attempt to prolong life. **4** As the reality of the situation becomes more apparent, depression sets in and the client may become withdrawn. **5** Acceptance is the final stage of grieving; this stage may never be achieved.

**Reference:** [Ch 1](#), Grieving Process, Theorists: Stages of Grieving

**54. 2 Cold stress produces hypoxia and acidemia. Because of physiologic factors, such as lack of brown fat, the preterm infant is more vulnerable to cool temperatures.**

**1, 3** These are not the priority. **4** This is necessary when the infant has an Apgar score of 0 to 3.

**Reference:** [Ch 27](#), Foundations of Nursing Care for Newborns, Nursing Care Common to All Newborns

**55. 2 Patency promotes bladder decompression, which prevents distention and bleeding; continuous flow of an irrigant limits clot formation and promotes hemostasis.**

**1** This is not associated with a transurethral resection of the prostate (TURP); a cystostomy tube is a catheter that is placed directly into the bladder through a suprapubic incision. **3** No abdominal incision is made because the resection is performed via the urethra. **4** Although hemorrhage and infection may occur, no wound is observed because the surgery was performed via the urethra.

**Reference:** [Ch 12](#), Benign Prostatic Hyperplasia, Nursing Care

**56. Answer: 21 gtt/min. Multiply the amount to be infused (125) by the drop factor (10) and divide the result by the amount of time in minutes (60 minutes); the product, 20.8, must be rounded up to 21 gtt/min.**

**Reference:** [Ch 3](#), Fluid, Electrolyte, and Acid-Base Balance; General Nursing Care of Clients with Fluid and Electrolyte Problems

**57. 2 This presents reality and simply states expected behavior.**

**1** This is an authoritarian, not a therapeutic, statement. The client has the right to refuse medication. **3** This assumes that the client does not want to take medication, whereas the client may not understand what to do. **4** This does not tell the client what behavior is expected. The client may not understand the concept of cause and effect.

**Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**58. 4 The use of reflection assists the client in expressing feelings, which is the major goal of therapy.**

**1, 3** This is a defensive response by the nurse that tends to cut off communication and limit the expression of feelings. **2** This response avoids discussion of the client's feelings about the therapist.

**Reference:** Ch 16, Therapeutic Nurse-Client Relationship, Overview

**59. 1 Hourly output is critical when kidney function is assessed; decreasing urinary output is a sign of rejection.**

**2** This is too long an interval between assessments of urinary output after a kidney transplant. **3, 4** This is too short an interval between assessments of urinary output after a kidney transplant.

**Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Disease, Nursing Care

**60. 4 Ineffective coping is the impairment of a person's adaptive behaviors and problem-solving abilities in meeting life's demands; ritualistic behavior is an impaired type of coping.**

**1, 2, 3** Not enough information is available to lead to this conclusion.

**Reference:** Ch 19, Obsessive-Compulsive Disorders, Data Base

**61. 3 The antagonist of magnesium sulfate is calcium gluconate.**

**1** This is ineffective if the action of magnesium is not reversed. **2** This is unnecessary; it is an opioid antagonist. **4** This may be necessary if the client has excessive secretions after a seizure. The priority intervention should attempt to prevent a seizure.

**Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**62. 2 The client is out of control and is dangerous to self and others. Safety requires sedation and a controlled environment.**

**1** Restraining a disturbed, belligerent client can cause injury because restraints generally increase anxiety and acting out. **3** This is inappropriate and may place the other client in a dangerous situation. **4** Any measures directed at verbal or physical correction of the client's behavior will be futile and may increase the hostile behavior.

**Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

**63. 3 This response is as optimistic as is possible while still being realistic.**

**1** This response is false reassurance; the client's status will depend on an individual response. **2** Medication does not affect progression of the disease; it only treats the signs and symptoms. **4** This response gives false reassurance; individual responses vary.

**Reference:** Ch 11, Myasthenia Gravis, Data Base

**64. 1 Because the pancreatic ducts are blocked and fibrotic, oral pancreatic enzymes must be given to make the nutrients digestible and absorbable.**

**2** Children with cystic fibrosis have good, even voracious, appetites despite respiratory

impairment. **3** Chewing of food is adequate despite coughing and shortness of breath; undernourishment results from inadequate nutrient absorption. **4** It is not the consistency of the foods that leads to inadequate digestion and absorption, but the lack of enzymes from the pancreatic duct.

**Reference:** [Ch 31](#), Cystic Fibrosis, Data Base

**65. 3 Infants with compromised heart function often become fatigued during sucking and swallowing because they have a decreased cardiac output.**

**1** When there is fatigue during feeding, generally it is an indication of some pathology; healthy infants suck vigorously until sated, and only then do they become tired. **2** Impaired sucking is never insignificant; it may be indicative of many problems, such as central nervous system (CNS) involvement, immaturity, or a congenital defect. **4** Healthy infants are free of mucus within 24 to 48 hours after birth.

**Reference:** [Ch 30](#), Cardiac Malformations, Data Base

**66. 1 Hypoxia leads to poor peripheral circulation; clubbing occurs as a result of tissue hypertrophy and additional capillary development in the fingers.**

**2** Respirations generally are rapid to compensate for oxygen deprivation. **3** This is not a physiologic response in children with chronic hypoxia. **4** These children have polycythemia.

**Reference:** [Ch 30](#), Cardiac Malformations, Data Base

**67. 1 This traction is used to reduce the fracture, align the bone, and temporarily reduce muscle spasm.**

**2** Edema occurs because of tissue trauma and will not be prevented by the use of Buck extension. **3** A fractured head of the femur is repaired via internal fixation; a cast is unnecessary. **4** Damage already has occurred at the time of trauma and is not prevented by the use of Buck extension.

**Reference:** [Ch 11](#), Fracture of the Hip, Data Base

**68. 1 This ensures abduction of the leg to maintain position of the prosthesis and avoid dislocation.**

**2** This is not necessary as long as abduction of the limb is maintained. **3** This causes flexion of the hip; it is done only if ordered by the health care provider. **4** A trochanter roll at the ankle can cause damage to the peroneal nerve along the external malleolus.

**Reference:** [Ch 11](#), Fracture of the Hip, Nursing Care

**69. 1 This client is demonstrating increased agitation and poses an immediate threat to the safety of other clients. The behavior requires immediate nursing intervention to prevent injury to self or others.**

**2** Although the client may be hallucinating, there is no immediate threat to self or others. The client should be monitored to ensure that the behavior does not escalate or become aggressive. **3** Although the client may be suspicious, data given do not indicate that this presents a danger to self or others. **4** Although anxious, this client does not represent a threat to self or others.

**Reference:** [Ch 19](#), General Nursing Care of Clients With Mood disorders

**70. 2 This offers support and provides the client with an opportunity to discuss feelings.**

**1** This intervention does not address the client's depression. **3** Teaching is inappropriate

when a client is emotionally distressed. **4** This limits further communication and may imply rejection.

**Reference:** [Ch 19](#), General Nursing Care of Clients with Mood Disorders

**71. 4 Rationalization is an unconscious defense mechanism whereby a person finds logical reasons for behavior or feelings while ignoring the illogical or unacceptable real reasons.**

**1** Projection is an unconscious defense mechanism whereby an individual attributes or blames personal inadequacies on others. **2** Suppression is the conscious putting out of the mind of an unacceptable impulse of idea. **3** Identification is an unconscious defense mechanism whereby an individual assumes the characteristics, traits, posture, and achievements of another person or group.

**Reference:** [Ch 15](#), Anxiety and Coping Behaviors, Defense Mechanisms

**72. 4 A non-rebreather mask can accurately deliver high concentrations of oxygen (>90%). It cannot be used with a high degree of humidity.**

**1** This is a face mask. It delivers low to medium concentrations of oxygen (40% to 60%) by adjusting the oxygen flow rate to 6 to 12 L/min. **2** This is a Venturi mask. It can deliver precise high-flow rates of oxygen. Concentration and liter flow are marked on the mask apparatus; it can be adjusted to deliver concentrations of 24%, 28%, 31%, 35%, 40%, or 50% oxygen. **3** This is a face tent. It delivers an imprecise amount of oxygen. It is designed to provide moderate to high-density humidification.

**Reference:** [Ch 7](#), Related Procedures, Oxygen Therapy

**73. 1 Cool mist helps reduce inflammation of the upper respiratory tract.**

**2** Inhalant drugs are administered through nebulizers. **3** The mist has no effect on surface tension of the respiratory tract. **4** This is not the purpose of humidified oxygen.

**Reference:** [Ch 30](#), Respiratory Tract Infections, Nursing Care

**74. 1 Beginning with equipment is less threatening and may stimulate feelings of mastery.**

**2** This will provide information but will do little to aid acceptance. **3** This is helpful but may take time and therefore may not meet immediate needs. **4** This will do little to aid acceptance.

**Reference:** [Ch 8](#), Cancer of Small Intestine, Colon, or Rectum; Nursing Care

**75. 4 The rhythmic movement of the merry-go-round provides an opportunity for the child to practice spatial and sensory orientation. This is important in helping the child increase interaction with the environment.**

**1, 3** This does not provide rhythmic movements that would engage the child. **2** The autistic child rejects cuddling and anything that feels cuddly.

**Reference:** [Ch 17](#), Pervasive Developmental Disorders, Data Base

# Answers and Rationales: Part B

**76. 1 Protein in the urine is a sign of preeclampsia, as are elevated blood pressure and weight gain of more than 2 pounds per week.**

**2** Changes in body temperature are not associated with preeclampsia. **3** These signs indicate preeclampsia; treatment does not require a vaginal examination. **4** This is premature. More data must be collected and documented first.

**Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Data Base

**77. 3 It is expected that a newborn will enter a sleep phase about 30 minutes after birth.**

**1** After the initial cry, the baby will settle down and become quiet and alert. **2** This occurs after the first sleep. **4** This occurs during the first period of reactivity.

**Reference:** Ch 27, Foundations of Nursing Care of Newborns, Adaptation to Extrauterine Life

**78. 3 This accurately describes the behavioral therapy method of systematic desensitization.**

**1** This is a different behavioral approach called flooding. **2** This is a different behavioral approach called operant conditioning. **4** This is a psychoanalytic type of therapy rather than a behavioral approach.

**Reference:** Ch 19, Phobic Disorders, Data Base

**79. 1 Protein is required for the building and repair of intestinal tissues.**

**2** Increased protein will not significantly affect peristalsis. **3** Anemia may result from chronic bleeding; usually, it is corrected with increased iron and adequate protein intake. **4** Once tissues are repaired, muscle tone may improve eventually.

**Reference:** Ch 8, Review of Nutrients, Sources of Energy

**80. 1 In addition to dilation of bronchi, treatment is aimed at expectoration of mucus. Mucus interferes with gas exchange in the lungs.**

**2** This is an unrealistic goal; asthma is a chronic illness. **3** Increased fluid intake helps liquefy secretions. **4** Asthma has a psychogenic factor, but this is not the only cause; it may occur as an allergic response to an antigen, such as dust.

**Reference:** Ch 7, Obstructive Airway Diseases, Data Base

**81. 1 Head lag in an infant who is 6 months old is abnormal and is frequently a sign of cerebral damage.**

**2** The Babinski reflex may be present until 2 years of age. **3** The ability to sit unsupported is achieved at 7 to 8 months. **4** The grasp reflex usually disappears by 3 months.

**Reference:** Ch 30, Hydrocephalus, Data Base

**82. 3 This approach allows for ventilation of feelings and clarifies explanations that probably were not heard or understood because of anxiety.**

**1** This prevents the client from facing the problem, thereby increasing her feelings of loss of control. **2** This closes off communication by not allowing free expression of grief and assumes that the client blames herself. **4** This supports avoidance of the reality of the situation; it does not solve the problem.

**Reference:** Ch 29, Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs

**83. 4 This parent's action gives the child more control by allowing the child to make a decision. This demonstrates an understanding of what the toddler can and cannot do safely.**

**1** Toddlers are too young to understand that this type of punishment is a response to the temper tantrum; it may lead to more frustration and anger. **2** Although tantrums as attention-getting devices largely must be ignored, isolating the child will produce feelings of rejection and insecurity. **3** This may lead to the development of more manipulative tactics, since the action brought a degree of success initially.

**Reference:** Ch 31, Growth and Development, Major Learning Events

**84. 1 Because the compulsive ritual is used to control anxiety, any attempt to prevent the action will increase anxiety.**

**2** Underlying hostility is considered to be part of the disorder itself, not a reaction to an interruption of the ritual. **3** This is possible only if the anxiety reached panic levels and caused the person to express anger overtly. **4** This is not a pattern of behavior associated with this disorder.

**Reference:** Ch 19, Obsessive-Compulsive Disorders, Nursing Care

**85. 3 The therapeutic nurse-client relationship provides an opportunity for the client to try out different behaviors in an accepting atmosphere and ultimately to replace pathologic responses with more effective responses.**

**1** Verbal, not nonverbal, communication is the objective of the therapeutic relationship. **2** The nurse, although accepting of the client's hostile feelings, uses the therapeutic relationship to redirect hostile feelings into more acceptable behaviors. **4** The nurse provides the support and acceptance that encourage clients to make their own decisions.

**Reference:** Ch 16, General Nursing Care of Clients with Mental Health/Psychiatric Problems

**86. 2 African Americans represent a higher-risk population than Caucasian Americans for hypertension; the reason is unknown.**

**1** African-American women are more frequently affected by hypertension than are Caucasian women. **3** African Americans of both sexes have a higher prevalence than Caucasian Americans of both sexes. **4** African-American men have a higher risk than African-American women.

**Reference:** Ch 6, Hypertension, Data Base

**87. 3 Diuretics block sodium reabsorption and promote fluid loss, decreasing blood volume and reducing arterial pressure.**

**1** Direct relaxation of arteriolar smooth muscle is accomplished by vasodilators, not diuretics. **2** Vasodilators, not diuretics, act on vascular smooth muscle. **4** Drugs that act on the nervous system, not diuretics, inhibit sympathetic vasoconstriction.

**Reference:** Ch 6, Related Pharmacology, Diuretics

**88. 2 Thiazide diuretics are potassium-depleting agents; broccoli provides 267 mg of potassium per 100 grams.**

**1** Apples provide 80 to 110 mg of potassium per 100 g of fruit. **3** Cherries provide 191 mg of potassium per 100 g of fruit. **4** Cauliflower provides 206 mg of potassium per 100 g.

**Reference:** Ch 8, Review of Nutrients, Minerals

**89. 3 This response acknowledges feelings and attempts to collect more data.**

**1** This will not facilitate data collection about the extent of anxiety. **2** Anxiety is most often a response to a vague, nonspecific threat; the client will not be able to answer this question. **4** It is too early to try to identify the cause of the anxiety; crisis intervention with anxious clients requires a more structured approach than "Let's talk."

**Reference:** Ch 16, Crisis Intervention, Nursing Care of Clients in Crisis

**90. 2 The primary goal is to keep the client safe. A no-suicide contract secures the client's agreement not to attempt suicide for a specified period and to seek help when suicidal ideas increase.**

**1, 4** This is part of the treatment plan after the immediate crisis is controlled. **3** This is part of the long-range treatment plan after the immediate crisis is controlled.

**Reference:** Ch 19, General Nursing Care of Clients with Mood Disorders

**91. 4 This allows the child to manipulate unfamiliar equipment; this action tends to reduce the stress of hospitalization.**

**1** This is appropriate for school-age children and adolescents. **2** Although this is appropriate play for a 3-year-old child, it is somewhat limited because it does not give the child an opportunity to handle unfamiliar hospital equipment. **3** Storytelling is more appropriate for the school-age child.

**Reference:** Ch 32, Hospitalization of Preschoolers, General Nursing Care of Preschoolers

**92. 3 Deficiency of glucocorticoids causes hypoglycemia in the client with Addison disease. Clinical manifestations of hypoglycemia include nervousness; weakness; dizziness; cool, moist skin; hunger; and tremors.**

**1** Hypokalemia is evidenced by nausea, vomiting, muscle weakness, and dysrhythmias. **2** Weakness with dizziness on arising is postural hypotension, not hypertension. **4** An increased extracellular fluid volume is evidenced by edema, increased blood pressure, and crackles.

**Reference:** Ch 9, Addison Disease, Data Base

**93. 2 Hypocalcemia, decreased calcium in the blood, occurs because of the reciprocal relationship with phosphorus, which is increased by the decreased glomerular filtration rate.**

**1** Hyperkalemia, not hypokalemia, is more likely to occur because of decreased kidney function. **3** Hypernatremia, an increase in serum sodium, generally will not be present because fluid is retained in the same proportion as sodium. **4** Hyperglycemia, an increased serum glucose level, is not a clinical manifestation of chronic kidney failure.

**Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Disease, Data Base

**94. 2 This reading suggests a true anemia. The lowest hemoglobin resulting from physiologic anemia of pregnancy is 12 g/dL, which occurs because the plasma volume increases to a greater extent than the RBCs during pregnancy.**

**1** This is within the expected range of 5000 to 10,000/mm<sup>3</sup>; it may increase to 15,000/mm<sup>3</sup> during the second half of pregnancy. **3** This is within the expected range of 1.010 to

1.030. **4** This is not an unusual urine glucose level during pregnancy because of the lowered renal threshold for glucose during pregnancy; if the level increases to 2+, further investigation for diabetes should be undertaken.

**Reference:** Ch 25, Prenatal Period; Physical, Physiologic, and Emotional Changes during Pregnancy

95. **3** The increased height of the uterus may result from accumulation of blood in the uterus from internal hemorrhaging; vital signs may be indicative of impending shock.

**1, 2, 4** This is unsafe; the client needs immediate therapeutic intervention.

**Reference:** Ch 26, Postpartum Bleeding, Data Base

96. **Answer: 1, 2, 3, 5.**

**1** Central nervous system (CNS) irritation can cause auditory problems such as tinnitus. **2** A headache resulting from spinal anesthesia usually occurs 24 to 72 hours after its administration. Postural changes cause the diminished volume of cerebrospinal fluid to exert traction on pain-sensitive central nervous system structures. The client is most comfortable when lying flat. **3** Central nervous system irritation can cause visual problems such as photophobia and blurred vision. **4** This type of headache will worsen when the client is ambulatory. **5** The headache worsens when the client assumes an upright position. **6** The headache lessens when the client is lying flat.

**Reference:** Ch 25, Intrapartum Period, Data Base

97. **1** Dry skin is caused by decreased function of sebaceous glands; a paucity of thyroid hormones triiodothyronine ( $T_3$ ) and thyroxine ( $T_4$ ), which control the basal metabolic rate, can alter the function of almost every body system.

**2, 4** This occurs with hyperfunction of the thyroid and an increase in the basal metabolic rate. **3** The skin will not be flushed; the client will appear pale.

**Reference:** Ch 9, Hypothyroidism, Data Base

98. **2** Monitoring the mobility of the toes assesses neural integrity distal to the surgical site. This is part of a neurovascular assessment.

**1** The femoral artery is not assessed because it is not distal to the surgical site. **3** No pin is present with an open reduction and internal fixation of a fractured hip. **4** This assessment may cause flexion of the hip, which is contraindicated.

**Reference:** Ch 11, Fracture of the Hip, Nursing Care

99. **2** Because of a decreased metabolism, the usual adult dose of an opioid may result in an overdose. A decreased basal metabolic rate prolongs the time for drug detoxification and elimination.

**1** Hypothyroidism does not alter tolerance. **3** Opioids do not alter thyroid hormones. **4** Opioids will cause excessive sedation, not hyperactivity.

**Reference:** Ch 9, Hypothyroidism, Nursing Care

100. **4** Rapid respirations may be a sign of impending airway obstruction.

**1** Unless irritability is accompanied by severe restlessness, symptomatic care should be given. **2** Unless accompanied by signs of respiratory embarrassment, this needs no immediate intervention. **3** This may sound ominous, but it is not a sign of respiratory embarrassment.

**Reference:** Ch 30, Respiratory Tract Infections, Data Base

**101. 4 Children with persistent asthma must continue taking medications to keep them asymptomatic. Inhaled corticosteroids, long-acting  $\beta_2$  agonists, and leukotriene modifiers are used as controller medications.**

**1** Some environmental moisture is necessary for these children. **2** Consistent limits should be placed on the child's behavior regardless of the disease; a chronic illness does not remove the need to set limits. **3** The child's symptoms are being controlled by medications that are necessary to keep the child asymptomatic.

**Reference:** Ch 32, Asthma, Nursing Care

**102. 4 The presence of staff members will give the client support and will provide an opportunity for staff to distract and reassure the client. Continuous supervision is necessary for the safety of the client and others.**

**1** Although this intervention has value as a general measure, it is too soon to initiate this; it will not decrease the client's level of anxiety at this time. **2** This will be ineffective because it is unlikely the client will comprehend or remember explanations. **3** The client does not have the capacity to explore concerns; in fact, this can be counterproductive and anxiety producing.

**Reference:** Ch 18, General Nursing Care of Clients with Disorders Related to Alterations in Cognition and Perception

**103. 3 A culture of cerebrospinal fluid (CSF) reveals the presence of the causative microorganism (e.g., pneumococcus, tubercle bacillus, meningococcus, or streptococcus).**

**1** This demonstrates the presence of bacteria on the skin; it does not identify microorganisms in the CSF. **2** This is used to detect the presence of abnormalities through injection of a contrast medium into the subarachnoid space; it does not identify the causative microorganism. **4** This is not a definitive test, although it is done because occasionally a blood culture will be positive when a CSF culture is negative.

**Reference:** Ch 30, Meningitis, Nursing Care

**104. 1 After a pneumonectomy, the mediastinum may shift toward the remaining lung or the remaining lung may shift toward the empty space, depending on the pressure within the empty space. Either of these shifts will cause the trachea to move from its usual midline position. The trachea is palpated above the suprasternal notch.**

**2** Metastatic lesions do not appear rapidly. **3** Tracheal edema cannot be assessed through palpation. **4** The cuff of the endotracheal tube cannot be assessed through palpation of the trachea.

**Reference:** Ch 7, Malignant Lung Tumors, Nursing Care

**105. 2 Certain diagnostic tests (e.g., CBC, urinalysis, chest x-ray examination) are done preoperatively to rule out the existence of health problems that may increase the risks involved with surgery.**

**1** Feelings will not be dispelled by this response; it also blocks further communication. **3** Surgery poses a risk despite test results. **4** Lack of knowledge without a statement of plans to obtain the information suggests incompetence on the part of the nurse.

**Reference:** Ch 3, Perioperative Care, General Nursing Care of Clients during the

## Preoperative and Intraoperative Periods

**106. 2 Anxiety experienced by a preoperative client can be a disruptive force that may affect the client's ability to cope psychologically and physiologically. Anxiety must be alleviated for other nursing measures to be effective.**

**1** Although vital signs are recorded because they will serve as a baseline in postoperative assessment, it is not the priority. **3** Learning is hampered by high anxiety levels. **4** The diet is limited before surgery so that residue in the intestines is decreased.

**Reference:** Ch 3, Perioperative Care, General Nursing Care of Clients during the Preoperative and Intraoperative Periods

**107. 4 These are associated with infection. This is the greatest postoperative hazard for children with shunts for hydrocephalus.**

**1** This may occur as the result of an infected shunt; however, it is not the most common sign of an infectious process. **2** These occur with progressively increasing intracranial pressure, usually before shunt insertion. **3** The peritoneum absorbs cerebrospinal fluid adequately; ascites is not a problem.

**Reference:** Ch 30, Hydrocephalus, Nursing Care

**108. 2 An intensive preparatory regimen is needed to destroy the child's immune system. Once the process is started, no rescue therapy except for the transplant is provided.**

**1** The procedure is performed in children for recurrent malignancies. **3** The child's bone marrow must be clear of all cells before transfusion of the stem cells is performed. **4** It is not a simple procedure. Preparation for the transfusion is accomplished by destroying the immune system.

**Reference:** Ch 6, Leukemia, Data Base

**109. 2 Parenting can begin only when the infant and the mother get to know each other. To promote development, the nurse should provide time for mother-infant interaction.**

**1, 3, 4** Although this should be done, it is not the priority action.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Parent-Infant Relationships

**110. 3 A cephalohematoma is a collection of blood between the skull bone and its periosteum that results from trauma during birth. It resolves spontaneously in 3 to 6 weeks.**

**1** The swelling of a caput succedaneum crosses the suture line because it is outside the periosteum. **2** A fontanel is an opening between the skull bones that allows for growth of the brain and skull; it is common to all healthy newborns and is expected to bulge when the infant cries. **4** Molding is caused by pressure of the birth canal on the head during the second stage of labor; it is benign and disappears in several days.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Nursing Care Common to All Newborns

**111. 4 Famotidine (Pepcid) inhibits histamine at H<sub>2</sub>-receptor sites in the stomach, inhibiting gastric acid secretion.**

**1** Famotidine does not affect stress levels. **2** Famotidine inhibits, rather than neutralizes, gastric secretion. **3** Famotidine inhibits gastric secretion, not peristalsis.

**Reference:** Ch 8, Related Pharmacology, Antisecretory Agents

**112. 3 Intermittent or continuous loss of a small amount of blood over extended periods will lead to a decreased hemoglobin level; 8.5 g/dL is below the expected hemoglobin range for men (14 to 18 g/dL) and women (12 to 16 g/dL).**

**1** This serum iron level is within the expected range of 60 to 180 mcg/dL. **2** A serum uric acid level provides information about a client's purine metabolism. Expected values (men—3.5 to 8.5 mg/dL and women 2.7 to 7.3 mg/dL) vary from day to day and depend on the test in a specific laboratory; repeated tests several days/weeks apart are necessary for accurate assessments. **4** This transferrin level is within the expected range of 215 to 380 mg/dL.

**Reference:** Ch 8, Peptic Ulcer Disease, Data Base

**113. 3 Lavage removes blood from the stomach, and the irrigating solution produces vascular constriction, which helps control bleeding by limiting blood flow to the area.**

**1** Lavage does not cause the blood to clot. **2** Neutralization of acid by water irrigation will take time; antacids may be instilled to alter the pH. **4** Stimulation of the vagus nerve is not the purpose of a lavage for gastric hemorrhage.

**Reference:** Ch 8, Peptic Ulcer Disease, Data Base

**114. 2 Fever, chills, and low back pain indicate an acute hemolytic reaction, which is potentially life threatening; discontinuing the transfusion immediately limits kidney damage. The vein is kept open by running the primary bottle of normal saline.**

**1** Notifying the health care provider can be done later. The client's safety must be addressed first. **3** This may be done later. **4** Although the blood bank generally is notified if a reaction occurs, slowing the transfusion rate is unsafe because the reaction will continue.

**Reference:** Ch 6, Related Procedures, Blood Transfusion

**115. 4 A quiet, alert state is an optimum time for infant stimulation and interaction with the parent.**

**1** Bright lights are disturbing to newborns and may impede parent-child interaction. **2** The physical examination can be delayed. **3** There is no reason to reposition the infant; it does not increase the opportunity for stimulation and interaction.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Parent-Infant Relationships

**116. 2 RhoGAM will prevent sensitization from Rh incompatibility that may arise between an Rh-negative mother and an Rh-positive infant.**

**1** Because the newborn has type O blood with no ABO incompatibility, neither mother nor infant will require a transfusion; this is the mother's first pregnancy, so the risk for Rh incompatibility is minimal. **3** Only the mother's and the newborn's Rh factors are relevant at this time. **4** ABO incompatibility does not exist in this situation; it can if the mother had O positive and the newborn had type B blood.

**Reference:** Ch 27, Hemolytic Disorders, Data Base

**117. 3 This is related to the influence of maternal hormones; it is temporary.**

**1** This is unrelated to problems with bleeding. **2** This finding is not related to

infection. **4** This finding is unrelated to urinary elimination.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Adaptation to Extrauterine Life

**118. Answer: 2, 5.**

**1** Lethargy is associated with hypothyroidism; hyperactivity occurs with hyperthyroidism. **2** Tachycardia is associated with hyperthyroidism and is caused by the increase in the basal metabolic rate. **3** Weight gain occurs with hypothyroidism; weight loss occurs with hyperthyroidism because of the high metabolic rate. **4** Constipation is associated with hypothyroidism; frequent loose stools occur with hyperthyroidism. **5** Exophthalmos is associated with hyperthyroidism and results from accumulation of fluid behind the eyeball.

**Reference:** Ch 9, Hyperthyroidism, Data Base

**119. 2 Preschoolers view death as a separation; they believe the deceased will return to life. This is part of their fantasy world.**

**1** Preschoolers view death as a separation, or possibly a kind of sleep, and expect the deceased to return or wake up. **3** The preschooler does not yet have the understanding that older people are more likely to die. **4** The preschooler believes that the separation was initiated by the deceased, not by another force.

**Reference:** Ch 32, Hospitalization of Preschoolers, Data Base

**120. 4 Feelings of hopelessness are symptomatic of depression; the individual feels unable to find any solution to problems and thus feels overwhelmed.**

**1** Echolalia is the pathologic meaningless repetition of another's words or phrases and is associated with schizophrenia, not with depression. **2** Delusions are associated with psychotic disorders such as schizophrenia, not depression. **3** Confusion is not common because these individuals are in contact with reality.

**Reference:** Ch 19, Major Depression, Data Base

**121. 3 An amniotomy allows for more effective pressure of the fetal head on the cervix, enhancing dilation and effacement.**

**1** Vaginal bleeding may increase because of the progression of labor. **2** Discomfort may increase because contractions usually become more intense after an amniotomy. **4** An amniotomy should not affect maternal or fetal heart rates.

**Reference:** Ch 25, Intrapartum Period, Nursing Care

**122. 2 As cervical dilation nears completion, labor is intensified, causing an increase in energy expenditure; these result in perspiration and a flushed face.**

**1** The client usually is restless and thrashes about during transition, assuming no particular position. **3** Back pain usually indicates a posterior-lying position of the fetus's head. Perineal pain starts during the second stage of labor. **4** Pain is increased because contractions are more frequent and intense, and they last longer.

**Reference:** Ch 25, Intrapartum Period, Data Base

**123. 1 Members of self-help groups, particularly Alcoholics Anonymous, are living with the problem themselves; therefore, problem identification and self-responsibility are emphasized, and manipulation is limited.**

**2** Long-term therapy tends to increase anxiety until resolution occurs; level of

commitment and duration of therapy render it a less desirable choice for substance abusers. **3** Depending on the client's feelings about religion, this may or may not be helpful. **4** This depends on the friend's drinking status; it may be helpful or harmful. These variables negate the effectiveness of this choice.

**Reference:** Ch 20, Alcohol Abuse and Dependency, Data Base

**124. 2 Although members of the group may become impatient with one another's problems at times, the group usually is supportive. Members share common goals, and the opportunity is available to test out new patterns of behavior.**

**1** This statement is too universal; the rate and amount of change are individually based variables. **3** People with addiction problems have varied backgrounds; the only common denominator may be drug abuse. **4** This statement is too universal; although many clients function well in a group, some clients cannot.

**Reference:** Ch 20, Drug Abuse, Data Base

**125. 4 Most complications after cardiac catheterization involve the puncture site; included are localized hemorrhage and hematomas, as well as thrombosis of the femoral artery.**

**1** Providing a bed cradle is not necessary after cardiac catheterization. **2** Although this is important, it is not the priority assessment. **3** The client should remain supine to avoid disturbing the insertion site.

**Reference:** Ch 6, Related Procedures, Cardiac Catheterization

**126. 3 Lasix is potassium depleting; apricots have more than 440 mg of potassium per 100 g.**

**1** Apples have about 80 to 110 mg of potassium per 100 g. **2** Grapes have about 80 to 160 mg of potassium per 100 g, depending on the variety. **4** Cranberries have about 65 mg of potassium per 100 g.

**Reference:** Ch 8, Review of Nutrients, Minerals

**127. 3 This explores the meaning of the statement and allows further expression of concern.**

**1** This does not allow an explanation of feelings and cuts off communication. **2** This response lacks both empathy and understanding; it also cuts off communication. **4** This shirks responsibility; the client may be embarrassed to ask the health care provider and needs the nurse to act as facilitator.

**Reference:** Ch 21, General Nursing Care of Clients with Sexual and Gender Identity Disorders

**128. 1 An illusion is a misperception of an actual stimulus.**

**2** A delusion is a fixed false belief that is unrelated to an external stimulus. **3** Dissociation is a disturbance in the integrative functions of the client. **4** A hallucination is a false perception with no actual external stimulus.

**Reference:** Ch 18, Delirium, Data Base

**129. 1 These infants may have retinal dysplasia and other problems that interfere with vision acuity. Ocular disease may not be apparent for several months.**

**2** This does not affect renal function. **3** This does not affect long bone growth. **4** This does not affect auditory acuity.

**Reference:** Ch 27, TORCH, Data Base

**130. 4 Tolterodine (Detrol), a urinary tract antispasmodic, may cause dizziness and blurred vision, placing the client at risk for injury.**

**1** Although it is important to know if the client is experiencing anuria and/or overflow incontinence, which may indicate urinary retention, a detailed I&O record is unnecessary. **2** An extended release capsule should be swallowed whole and should not to be opened or chewed. If chewed or opened, the client will receive a surge of action and the long-term action of the medication is gone. **3** Tolterodine is classified as an anticholinergic, and adverse reactions include constipation and dry mouth; diarrhea and an increase in respiratory secretions are associated with drugs classified as cholinergics.

**Reference:** Ch 12, Related Pharmacology, Urinary Spasmolytics

**131. 1 Fine motor coordination is developed inadequately for manipulation of snap toys. Also, small beads are a choking hazard.**

**2** These stimulate the sense of touch, and since voluntary grasp appears at about 3 to 4 months, they can be handled satisfactorily. **3** The voluntary grasp will allow the child to hold the toy, and the rattling sound will stimulate the auditory system. **4** These are appropriate to stimulate visual attention.

**Reference:** Ch 30, Health Promotion of Infants, Play

**132. 1 Applying the diaper loosely for 2 or 3 days lessens pressure on the penis, thus promoting healing.**

**2** The newborn can be fed as usual. **3** This will be painful and irritating to the wound. **4** Bleeding is not expected, although the newborn should be monitored for signs of bleeding.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Nursing Care Common to All Newborns

**133. 3 The nurse needs to make an assessment; the nurse cannot rely on a visitor's observations.**

**1** The client probably will be unable to answer this question. **2** The nurse is intervening without first assessing the client; this may be threatening if the client is not out of control. **4** This may be done later, after the client is assessed.

**Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**134. Answer: 1, 2, 3.**

**1** Increased intracranial pressure can precipitate vomiting because of its effect on the chemoreceptor trigger zone in the medulla. **2** Because the cranial sutures are closed by this age, increased pressure can cause headache. **3** Irritability results from increased pressure in the cranium and as a response to related discomforts. **4** Pressure on the respiratory center in the brain results in a decreased, not increased, respiratory rate. **5** Blood pressure is increased, not decreased, with increased intracranial pressure in the toddler who has closed fontanels.

**Reference:** Ch 30, Meningitis, Data Base

**135. 2 This requires the client to find a common characteristic of two things, an ability that is a criterion for abstract thinking.**

**1** This tests orientation, not abstract thinking. **3** This tests judgment, not abstract thinking. **4** This tests short-term memory, not abstract thinking.

**Reference:** [Ch 18](#), Dementia, Data Base

**136. 2 Taking the blood pressure in the affected arm may injure the fistula.**

**1** The presence of a bruit indicates that the circulation is not obstructed by a thrombus. **3** Lying on the arm may injure the fistula and should be avoided. **4** These are signs of infection, which is a complication of an arteriovenous fistula.

**Reference:** [Ch 12](#), Chronic Kidney Failure/End-Stage Renal Disease, Nursing Care

**137. 1 Acknowledgment of the client's behavior will help lower the spouse's anxiety, reduce guilt, and encourage discussion of feelings.**

**2** Lack of understanding by the nurse can be interpreted as uncaring and can incite the spouse to make more angry remarks. **3** This is insensitive; it implies that the spouse did not know how to care for the client. **4** This is insensitive; it suggests inadequate judgment on the spouse's part.

**Reference:** [Ch 18](#), Dementia, Nursing Care

**138. 3 With myasthenia gravis, the sensitivity of the end plates at the postsynaptic junction to acetylcholine is reduced, thus interfering with muscle contraction.**

**Inadequate contraction of the ocular muscles results in double vision (diplopia).**

**1, 2** This is not a clinical manifestation associated with myasthenia gravis. **4** Nystagmus is not a clinical manifestation associated with myasthenia gravis; it is associated with multiple sclerosis.

**Reference:** [Ch 11](#), Myasthenia Gravis, Data Base

**139. 3 Clients with Addison disease must take glucocorticoids regularly to enable them to adapt physiologically to stress and prevent an addisonian crisis, a medical emergency similar to shock.**

**1** Activity is permitted as tolerated. **2** Sodium should be taken as desired because hyponatremia frequently occurs from diminished mineralocorticoid secretion. **4** Frequent visits to a health care provider are not necessary after control is established.

**Reference:** [Ch 9](#), Addison Disease, Data Base

**140. Answer: 1, 3, 5.**

**1** Anticholinergic effects of pyridostigmine (Mestinon) can cause respiratory depression, bronchospasm, laryngospasm, and respiratory arrest, which are life-threatening. **2** Bladder distention is not associated with pyridostigmine. **3** Anticholinergic effects of pyridostigmine can cause hypotension, tachycardia, bradycardia, dysrhythmias, and cardiac arrest. **4** Although pyridostigmine can cause incoordination, it does not cause fine tremors of the hands. **5** Pyridostigmine is an anticholinergic that increases the peristaltic activity of the intestines. The result is hyperactive bowel sounds.

**Reference:** [Ch 11](#), Related Pharmacology, Cholinesterase Inhibitors

**141. 2 This position will prevent pressure on the sac; if the sac ruptures, infection may occur.**

**1** Diapers should not be applied because they may irritate or contaminate the

sac. 3 Antiinfectives are too caustic. 4 Assessment of the area below the defect is essential for determining motor, urinary, and bowel function.

**Reference:** Ch 30, Defects of Neural Tube Closure, Nursing Care

**142. 2 Swimming helps keep the muscles supple, without requiring fine motor activity.**

1 Hiking might prove too rigorous for the client. 3 Manipulating a mouse and keyboarding require fine motor activity and will be difficult for the client. 4 Sedentary activities are not helpful in maintaining muscle tone.

**Reference:** Ch 11, Myasthenia Gravis, Nursing Care

**143. 4 The congenital defect prevents the infant from creating a tight seal with the lips to promote sucking. As a result, the infant swallows large amounts of air when feeding.**

**The parent should be taught to provide frequent rest periods and to burp the infant often to expel excess air in the stomach.**

1, 2 Infants with cleft lip and palate should be held upright during feedings. 3 Newborn infants cannot chew and do not make chewing movements.

**Reference:** Ch 30, Cleft Lip and Cleft Palate, Nursing Care

**144. 2 Abstinence 4 to 6 weeks before term is the best way to avoid contracting the virus and having an outbreak before the birth.**

1 Because the herpes virus is smaller than the pores of a condom, this type of protection has limited effectiveness. 3 Abstinence is necessary only when disease symptoms are present in the partner and during the last 4 to 6 weeks of pregnancy. 4 Washing is not sufficient to prevent contraction of this virus; contact already has been made.

**Reference:** Ch 27, TORCH, Data Base

**145. 4 Placing the client in the semi-Fowler position forces the heavy uterus to put pressure on the blood vessels at the site of the separating placenta. This controls bleeding to some extent.**

1 There is no indication that the clotting mechanism is disturbed. 2 This is contraindicated with placenta previa; it may further dislodge the placenta. 3 This is contraindicated in any client admitted with vaginal bleeding.

**Reference:** Ch 26, Placenta Previa, Data Base

**146. 2 The size of the breast buds is an indication of gestational age. Small, underdeveloped nipples reflect prematurity.**

1 A single palm crease is a clinical manifestation of Down syndrome, not of prematurity. 3 This is not a reliable indicator of gestational age; also, reflexes may be impaired in full-term infants. 4 Although the nails may be longer in a postterm infant, it is not a reliable indicator in a preterm infant.

**Reference:** Ch 27, Preterm Infant, Data Base

**147. 4 The presence of loosely associated, tangential thinking is one of the cardinal symptoms of schizophrenia; its lessening will demonstrate improvement.**

1 This behavior may reflect withdrawal from reality and does not necessarily signal improvement. 2 Most clients with schizophrenia are able to express negative feelings freely because control by the ego is ineffective. 3 This does not demonstrate an improvement; paranoid delusions usually are well organized and on the surface often seem logical.

**Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**148. 4 This provides safety for the nurse and the other staff member; placement closer to the door allows for a rapid exit.**

**1** This invades the client's territory and may precipitate an aggressive client response. **2** This is premature; the team is alerted when a client is out of control, harming self or others, and cannot be managed by the staff on the unit. **3** This may be viewed by the client as confrontational and may precipitate an aggressive response.

**Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**149. 2 Increasing cerebral edema may predispose the client to seizures; therefore, stimuli of any kind should be minimized.**

**1** Although intake and output should be monitored to identify oliguria, it will not limit the occurrence of a seizure. **3** Although this should be done, it will not limit the occurrence of a seizure. **4** A cesarean birth may not be needed.

**Reference:** Ch 26, Hypertensive Disorders of Pregnancy, Nursing Care

**150. 1 Safety is the priority before any other intervention is provided.**

**2** This is important, but less of a priority. **3** This is a later nursing action. **4** Although this is important, it is not the priority.

**Reference:** Ch 16, General Nursing Care of Clients with Mental Health/Psychiatric Problems

**151. 3 Side rails can help clients increase their movement in bed. They are immovable objects that provide a handhold for leverage when changing positions.**

**1, 2, 4** The need to use side rails for safety must be evaluated for each individual on the basis of mental and physical status and hospital regulations.

**Reference:** Ch 11, Brain Attack/Cerebral Vascular Accident, Nursing Care

**152. 1 Ossification of the long bones is incomplete in childhood; children's bones can flex to about a 45-degree angle before breaking. When the bone is angulated beyond 45 degrees, the compressed side bends and the torsion side breaks (greenstick fracture).**

**2** A transverse fracture usually is a complete fracture seen in blunt trauma; it occurs in adults because bone ossification is complete. **3** A compound fracture is a fracture with an open wound from which the bone protrudes; it seldom is seen in children. **4** A comminuted fracture is a fracture in which small fragments of bone are broken from the fracture site and lie in the surrounding tissue; it is rarely seen in children.

**Reference:** Ch 31, Fractures Throughout Childhood, Data Base

**153. 2 It takes 24 hours to reach the peak effect of transdermal fentanyl (Duragesic). Oral pain medication may be necessary to support client comfort until the fentanyl reaches its peak effect.**

**1** The nurse needs to administer the dose of transdermal fentanyl exactly as prescribed by the health care provider. **3** This is associated with tricyclic antidepressants, not transdermal fentanyl. **4** A transdermal medication is administered through the skin via a patch applied to the skin, not via the gastrointestinal tract.

**Reference:** Ch 3, Pain, Related Pharmacology, Opioid Analgesics

**154. 1 Assessment is the first step of the nursing process, and vital signs provide vital information about the client's cardiopulmonary status.**

**2,4** Although this may be done, it is not the priority. **3** Although this may be done, it is not the priority. Administration of oxygen may alter the client's baseline vital sign results.

**Reference:** Ch 6, Coronary Artery Disease, Myocardial Infarction, Data Base

**155. Answer: 2, 3.**

**1** Environmental stimuli do not have to be reduced. **2** Individuals with spinal cord injury, particularly injury higher in the vertebral column, remain unstable for several weeks after the injury. Maintaining a patent airway is a priority. **3** Physiologic instability during the first several weeks after injury results in fluctuating vital signs, including blood pressure readings. **4** This is too early to institute a bowel and bladder training program. **5** This is inappropriate because family members are coping in the present; also, it is too early to determine how much function the client may recover.

**Reference:** Ch 11, Spinal Cord Injury, Nursing Care

**156. 3 The elevated temperature may be indicative of an infection; if so, immediate treatment, probably with antibiotics, is required.**

**1** The procedure is a short one; there is some pain or discomfort. **2** The woman's signature is all that is required in most states. **4** A light menstrual flow is expected for several days.

**Reference:** Ch 23, Induced Abortion, Nursing Care

**157. 4 This is an objection of some women that the nurse must consider when providing counseling about the diaphragm.**

**1** The failure rate is 4% to 35% when used without a spermicide; effectiveness increases with the use of a spermicide. **2** This problem has not been documented. **3** These can be side effects of oral contraceptives, not the diaphragm.

**Reference:** Ch 23, Contraceptive Methods, Nursing Care

**158. 4 Tubercle bacilli are transmitted through airborne droplets; therefore, respiratory isolation with an Ultra-Filter mask is necessary.**

**1** Transmission occurs through the airborne route, not via fomites. **2** Contact of family members with others does not have to be limited as long as isolation precautions are employed by family members when visiting the client. **3** Transmission occurs through the airborne route; gowns and gloves are unnecessary.

**Reference:** Ch 7, Pulmonary Tuberculosis, Nursing Care

**159. 2 Because this drug has a strong affinity for fluids, it will swell in the intestine. The large bulk stimulates peristalsis. A full glass of fluid taken at the same time will help minimize the risk of esophageal obstruction or fecal impaction.**

**1** Senna (Senokot), a stimulant laxative, may discolor urine, not psyllium (Metamucil). **3** Psyllium, a bulk-forming laxative, is among the safest laxatives on the market. It is useful with prolonged therapy because it is not systemically absorbed and is not potent in its action. **4** Prolonged use of lubricant or saline/osmotic laxatives can inhibit the absorption of some fat-soluble vitamins.

**Reference:** Ch 8, Related Pharmacology, Cathartics/Laxatives

**160. 1 A decreased concentration of extracellular sodium causes a decrease in the release of antidiuretic hormone (ADH). This leads to increased excretion of urine.**

**2** Sodium restriction does not control the volume of food intake; weight is controlled by a low-calorie diet, exercise (if permitted), and prevention of fluid retention. **3** The resulting elimination of excess fluid reduces the workload of the heart but does not improve contractility. **4** Potassium is inefficiently retained by the body; an adequate intake of potassium is needed.

**Reference:** Ch 6, Heart Failure, Data Base

**161. 3 When ambulating a client, the nurse walks on the client's stronger or unaffected side. This provides a wide base of support and therefore increases stability during the phase of ambulation that calls for weight-bearing on the affected side as the unaffected limb moves forward.**

**1, 2** This tends to change the center of gravity from directly above the feet and may cause instability. **4** This will not support the client as the strong leg moves forward and weight-bearing is on the affected side.

**Reference:** Ch 11, Fracture of the Hip, Nursing Care

**162. 3 This allows an active preschooler to move within restrictions and encourages use of the imagination.**

**1** Unless carefully selected, many television shows are inappropriate and uninteresting for a preschool-age child. **2** Although a preschool-age child may still cling to a security toy, it will not stimulate the child's imagination. **4** This may provide the child with rest, but this activity is too simple for a preschool-age child and will not promote development.

**Reference:** Ch 32, Health Promotion of Preschoolers, Play

**163. 4 Rh-negative cells are not attacked by maternal antibodies in the infant's blood. Giving Rh-positive cells will lead to further hemolysis**

**1** This is irrelevant because the blood cells usually do not come from the mother. **2** Rh-negative blood is not neutral; it provides a temporary safeguard from further hemolysis. **3** A reaction to other antigens in the crossmatched blood may occur.

**Reference:** Ch 27, Hemolytic Disorders, Data Base

**164. 3 These are some of the first signs of hypoxia; the airway must be kept patent to promote oxygenation.**

**1, 2, 4** These are late signs of respiratory difficulty; suctioning and other measures should have been implemented before these clinical findings are manifested.

**Reference:** Ch 30, Respiratory Tract Infections, Nursing Care

**165. 3 The priority of care at this time is to protect the spine from additional damage to the traumatized area while it heals.**

**1** Although important, it is not the immediate priority. A urinary tract infection can result from urinary stasis because of prolonged immobility. **2** Although important, it is not the priority in the immediate postinjury period. **4** Vocational rehabilitation will assume greater importance after the client's condition stabilizes.

**Reference:** Ch 11, Spinal Cord Injury, Data Base

**166. 1 Jaundice occurs because of the expected physiologic breakdown of fetal red blood cells and the inability of the newborn's immature liver to conjugate the resulting bilirubin. Breastfed neonates are more prone to physiologic jaundice because of**

**diminished calorie and fluid intake in the three days before milk is produced.**

**2** Conjugation and excretion, not synthesis of bile, are compromised because of the immature liver. **3** This is unrelated to the newborn's hemoglobin level; the mother and the fetus had separate circulations. **4** Newborns usually have high hemoglobin and high hematocrit levels.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Adaptation to Extrauterine Life

**167. 3 Eye patches are applied while receiving phototherapy to prevent drying of the conjunctiva, injury to the retina, and alterations in biorhythms.**

**1** The infant will close the eyes automatically in response to bright lights and application of a patch. **2** The infant should be exposed to bright lights periodically so circadian rhythms will become established. **4** These movements are automatic during different phases of sleep and will not be affected by eye patches.

**Reference:** Ch 27, Hemolytic Disorders, Data Base

**168. 1 The field should be placed on a clean, dry table near the client. A client's bed surface may not be clean and the client's movements may cause the field to become contaminated.**

**2** The outer inch of the sterile field is considered contaminated. Sterile objects must be kept within the one-inch border of the sterile field. **3** Expired equipment must be discarded. Sterile gloves are donned after the soiled dressing is removed and contained, the hands washed, and the sterile field is prepared. **4** This is the correct technique if using forceps to hold wet gauze. This keeps the flow of the sterile solution in the direction of sterile equipment. If forceps are held with the tips higher than the wrist, sterile solution will flow in the direction of the caregiver and may become contaminated by flowing onto an unsterile surface.

**Reference:** Ch 3, General Nursing Care of Clients at Risk for Infection

**169. 2 Increased intracranial pressure exerts pressure on the vomiting center in the brain, resulting in projectile vomiting unrelated to feeding.**

**1** The eyeballs will show signs of increased fluid volume in the skull and will be pushed forward, pulling the lids taut. **3** The fontanelles will show signs of increased fluid volume in the skull and therefore will bulge. **4** In adults, increased intracranial pressure causes a widening pulse pressure (the systolic pressure is increased and the diastolic pressure is the same or decreased). This is rarely seen in infants and children.

**Reference:** Ch 30, Hydrocephalus, Data Base

**170. 3 The trauma of surgery results in some seeping or oozing of blood into the remaining gastric area for 10 to 12 hours until coagulation takes place.**

**1, 2** This is too short a time for coagulation of blood to occur after the trauma of surgery. **4** Light-red drainage 24 to 48 hours after surgery is abnormal and unexpected; the health care provider should be notified.

**Reference:** Ch 8, Peptic Ulcer Disease, Nursing Care

**171. 2 Too rapid administration can cause hyperkalemia, which contributes to a long refractory period in the cardiac cycle, resulting in cardiac dysrhythmias and arrest.**

**1** Although acidosis can cause hyperkalemia, hyperkalemia will not lead to

acidosis. **3** These reactions do not occur with hyperkalemia. **4** Hyperkalemia usually causes nausea, vomiting, and diarrhea, which may result in dehydration; in this instance, fluid will shift from interstitial spaces to the intravascular compartment. With edema, the fluid shift occurs in the opposite direction.

**Reference:** [Ch 3](#), Fluid and Electrolyte Balance, Major Ions (Electrolytes)

**172. Answer: 1, 3, 5.**

**1** Preterm newborns have little subcutaneous fat; the skin is wrinkled, and blood vessels and bony structures are visible. **2** Sole creases develop progressively, covering the entire foot at term. **3** Breast bud size is small with underdeveloped nipples. **4** Preterm male infants' testes are undescended; rugae develop progressively and cover the entire scrotum of the full-term male newborn. **5** Preterm infants' ears contain little cartilage and are very springy when folded; at term, the ears contain cartilage and the pinnae are firm.

**Reference:** [Ch 27](#), Preterm Infant, Data Base

**173. 2 Small feedings reduce the amount of bulk passing into the jejunum and therefore reduce the fluid that shifts into the jejunum.**

**1** Although a diet high in roughage may be avoided, a low-residue, bland diet is not necessary. **3** Daily fluid intake does not have to be restricted; however, fluids should not be taken immediately before, during, or after a meal because they promote rapid stomach emptying. **4** Concentrated sweets pass rapidly out of the stomach, and increase fluid shifts; the diet should be low in carbohydrates. Protein is needed to promote tissue repair.

**Reference:** [Ch 8](#), Peptic Ulcer Disease, Nursing Care

**174. 1 The residual limb is elevated for the first 24 hours after surgery to reduce edema and then is placed flat on the bed to prevent hip flexion contractures.**

**2, 3** This is too soon; the residual limb is elevated in bed for the first 24 hours. **4** The dressing applied on the completion of surgery should not be disturbed at this time because it is supporting hemostasis.

**Reference:** [Chapter 11](#), Amputation, Nursing Care

**175. Answer: 1, 4, 5.**

**1** One of the benefits of regular exercise is that it promotes peristalsis. **2** Medications should not be recommended or taken during pregnancy without a prescription. **3** Caffeinated beverages do not relieve constipation and may be harmful. Staying hydrated by drinking 8 to 10 glasses of fluid per day may relieve the constipation. Water, milk, and fruit juices are recommended. **4** High-fiber foods promote peristalsis. **5** Setting aside a specific time of day helps establish regular bowel habits.

**Reference:** [Ch 25](#), Prenatal Period; Physical, Physiologic, and Emotional Changes during Pregnancy

**176. 2 This statement acknowledges the client's feelings and offers as opportunity to talk in the future; this shows the nurse cares and is not abandoning the client. Pursuing the topic while the client is angry may result in an escalation of the client's anger, jeopardizing the nurse and others.**

**1, 3, 4** This requires trust on the part of the client, which may or may not be justified at this time; the client feels betrayed and is angry.

**Reference:** [Ch 18](#), Schizophrenic Disorders, Nursing Care

**177. 3 A relaxed uterus is the most frequent cause of bleeding in the early postpartum period. The uterus can be returned to a state of firmness via intermittent gentle fundal massage.**

**1** Immediate action is directed toward the client's safety; the health care provider is called if nursing intervention does not control the bleeding. **2** The vital signs are checked after another intervention that addresses the client's immediate needs. **4** Steady bleeding is a complication that must be attended to immediately.

**Reference:** [Ch 25](#), Intrapartum Period, Nursing Care

**178. 4 Atelectasis refers to the collapse of alveoli; breath sounds over the area are diminished.**

**1** A productive cough most often is associated with inflammation or infection, not atelectasis. **2** This is not specific to atelectasis. Clubbing of the fingertips is a late sign of chronic hypoxia related to prolonged obstructive lung disease. **3** Crackles are associated with fluid in the alveoli, which occurs with heart failure and pulmonary edema.

**Reference:** [Ch 3](#), Perioperative Care, Nursing Care of Clients during the Postoperative Period

**179. 3 Chemotherapy and leukemia cause immunosuppression (low WBCs), thus increasing the risk for infection.**

**1** The child should maintain physical activity that can be tolerated. **2** Although vital signs must be checked to assess for changes in pulse or blood pressure, unless there is clinical evidence of bleeding, it is not necessary to obtain vital signs every 2 hours. **4** Children need stimulation that is appropriate for their developmental level except when acutely ill.

**Reference:** [Ch 32](#), Leukemia, Nursing Care

**180. 3 A common side effect of vinCRISTine is a paralytic ileus that results in constipation. Preventative measures include high-fiber foods and fluids that exceed minimum requirements. These will keep the stool bulky and soft, thereby promoting evacuation.**

**1, 2, 4** This will not provide the roughage and fluids needed to minimize the constipation associated with vinCRISTine.

**Reference:** [Ch 32](#), Leukemia, Nursing Care

**181. 3 A low platelet count predisposes to bleeding, which may be evident in the urine. RBCs are seen microscopically in the sediment.**

**1** Protein is not found in the urine when the platelet count is low. **2** Glucose is not found in the urine when the platelet count is low. **4** Lymphocytes usually are not found in the urine.

**Reference:** [Ch 32](#), Leukemia, Nursing Care

**182. 3 The protective blood-brain barrier initially screens leukemic cells from the central nervous system (CNS). However, in advanced stages, leukemic infiltration occurs.**

**Chemotherapeutic agents, also screened out by the blood-brain barrier, are ineffective.**

**1** Radiation destroys, not just retards, malignant cells. **2** Radiation does not decrease cerebral edema. **4** Irradiation of the cranium is needed because chemotherapy does not pass the blood-brain barrier.

**Reference:** Ch 32, Leukemia, Nursing Care

**183. 3 The health care provider needs to be aware of the reason for the client's lack of response to the medication so that an alternate treatment plan or financial assistance can be arranged (e.g., go to The National Council on the Aging website [BenefitsCheckUp.org] to establish whether the client is eligible for assistance from any community, state, or federal programs or from the drug company).**

**1** A health care provider may prefer the proprietary form of the medication. Asking the pharmacist to provide a generic form of the medication is unsafe. Recommending that the client obtain a generic form of the medication is not within the legal role of the nurse, unless the health care provider documents that this is acceptable. **2** Medications purchased over the Internet may be illegally imported, counterfeit, expired, or contaminated and therefore should be avoided. **4** Although some prescription insurance plans may help to reduce the cost of some medications, the client may not be able to afford the insurance.

**Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration

**184. 2 The most likely cause is a disturbance in the ratio of calcium to phosphorus, with the amount of serum calcium reduced and the serum phosphorus increased; milk and other dairy products are excellent sources of calcium.**

**1** Leg cramps are related to hypocalcemia, not hypercalcemia. **3** An elevated potassium level is manifested by muscle weakness. **4** A low potassium level is evidenced by fatigue and muscle weakness.

**Reference:** Ch 25, Prenatal Period; Physical, Physiological, and Emotional Changes during Pregnancy

**185. 4 Simvastatin (Zocor) is contraindicated in pregnancy because it is capable of causing fetal damage (teratogenic). It is a Pregnancy Category X teratogen.**

**1** Simvastatin should be taken in the evening because most cholesterol is synthesized between 12 midnight and 3:00 AM. **2** Liver function tests should be done at 6 to 12 weeks initially and only then every 6 months. **3** Although wearing sunscreen should be taught, sensitivity reactions are a rare occurrence; it is not as important as the action in another option.

**Reference:** Ch 6, Related Pharmacology, Antilipidemics

**186. Answer: 3, 4.**

**1** This usually is accomplished at 5 years of age. **2** This requires balance that is not present until 4 or 5 years of age; the 3-year-old child usually can ride a tricycle. **3** This can be expected; usually, it is accomplished by 3 years of age. **4** Children at 3 years of age are able to walk up the stairs alternating the feet; they also can jump off the bottom step. **5** This is not accomplished until later in the school-age years.

**Reference:** Ch 32, Growth and Development, Three Years

**187. 1 A side effect of methylphenidate (Ritalin) is anorexia; it should be given during or immediately after breakfast.**

**2** The absorption rate is not affected by the timing of when it is given. **3** This is not a side effect of methylphenidate. **4** At this age, the parents are responsible for administering medications.

**Reference:** Ch 17, General Nursing Care of Children with Disorders First Evident in Infancy, Childhood, or Adolescence

**188. 3 The high-pressure alarm signifies increased pressure in the tubing or the respiratory tract; obstruction usually is caused by excessive secretions.**

**1** This is a dependent function of the nurse and cannot be implemented without a health care provider's order. **2** High-volume, low-pressure cuffs make this unnecessary; it will decrease the effectiveness of the ventilator and compromise respiratory status. **4** The temperature can remain constant, usually at about 5° F to 10° F below body temperature.

**Reference:** Ch 7, Related Procedures, Mechanical Ventilation

**189. 1 The system must remain airtight (closed) to prevent collapse of the lung.**

**2** The system is kept closed; a record of drainage is kept by marking the outside of the container or chamber. **3** It should bubble but not vigorously; vigorous bubbling will not increase the suction but will cause the fluid to evaporate more rapidly. **4** The water level will fluctuate as the client inhales and exhales. The level will increase with inspiration and decrease with expiration; this is known as *tidaling*.

**Reference:** Ch 7, Related Procedures, Chest Tubes

**190. 1 Hallucinations occur most often when sensory stimulation is diminished because there is less competition for attention.**

**2, 3, 4** This activity competes for sensory attention and thereby diminishes hallucinations.

**Reference:** Ch 18, Schizophrenic Disorders, Nursing Care

**191. 4 A life-threatening effect of cycloSPORINE (Gengraf, Sandimmune) is nephrotoxicity. Therefore, creatinine and blood urea nitrogen (BUN) levels should be monitored.**

**1** Although abnormal hairiness (hirsutism) is an effect of cycloSPORINE, it is not life-threatening. **2** Diarrhea, not constipation, is a response to cycloSPORINE. **3** CycloSPORINE does not cause cardiovascular life-threatening effects.

**Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Disease, Nursing Care

**192. 4 The primary concern for pregnant women who practice pica is that their diet is nutritionally inadequate. Nutritional guidance may be necessary based on this assessment.**

**1** Pica does not indicate a psychologic/emotional disturbance; frequently, it is influenced by the client's culture. **2** If not toxic to the mother, it generally is not fetotoxic. **3** Iron is routinely prescribed during pregnancy; this does not specifically address the practice of pica.

**Reference:** Ch 25, Prenatal Period; Physical, Physiological, and Emotional Changes during Pregnancy

**193. 3 Ambulation decreases irregular contractions (i.e., preparatory contractions, Braxton Hicks contractions).**

**1** Preparatory contractions increase when the client is resting. **2** These contractions are not indicative of true labor and need not be timed. **4** Medications should not be recommended by the nurse; this is a dependent nursing function.

**Reference:** Ch 25, Intrapartum Period, Data Base

**194. 3 Losartan (Cozaar) is an antihypertensive. It blocks vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites. A lowering of the client's blood pressure reflects a therapeutic response and should be monitored frequently.**

**1** The client may be at risk for hyperkalemia, not hypokalemia. **2** Losartan may be taken without regard to meals. **4** Doubling a dose is unsafe. A missed dose can be taken as long as it is not close to the next scheduled dose.

**Reference:** Ch 6, Related Pharmacology, Antihypertensives

**195. 4 A negative rubella titer indicates no immunity. Immunizations are given safely during the immediate postpartum period.**

**1** Penicillin will not affect the client's immune status. **2** The mother's negative rubella titer does not affect the infant. **3** A client with a negative titer has no immunity to rubella.

**Reference:** Ch 25, Postpartum Period, Nursing Care

**196. 4 The shunt may obstruct, leading to accumulation of cerebrospinal fluid (CSF) and increased intracranial pressure.**

**1** Although providing pain relief for the infant is an important part of postsurgical care, monitoring for potentially severe complications such as increased intracranial pressure takes precedence. **2** Positioning the infant flat helps to prevent complications that may result from too rapid reduction of intracranial fluid. **3** The infant is positioned off the shunt to prevent pressure on the valve and incisional area.

**Reference:** Ch 30, Hydrocephalus, Nursing Care

**197. 4 A well-balanced diet with fewer calories because of decreased metabolism is suggested for older adults.**

**1** Limited financial resources are one cause of malnutrition in the older adult. **2** Fluid needs do not increase. An older client who becomes dehydrated probably is not maintaining a minimum fluid intake. **3** High carbohydrates will provide excessive calories, which may result in obesity. Balance should be maintained among the food groups according to dietary guidelines advocated by the U.S. Department of Agriculture and the U.S. Department of Health and Human Services; protein is needed for tissue replacement.

**Reference:** Ch 5, The Middle-Older Adult (Age 75 to 84 Years) and Old-Older Adult

**198. 2 Because the drug was just administered, the blood level of the drug will be at its highest.**

**1** This will produce inaccurate results; peak and trough levels are measured in relation to the time a drug is administered. **3** This result will reveal a drug blood level halfway between peak and trough levels. **4** This is done for a trough level, when the drug level

is at its lowest.

**Reference:** Ch 2, Medication Administration, Factors Influencing Drug Dosage and Response

**199. 3 The presence of food limits the irritating effect of steroids on the gastric mucosa.**

**1** Food does not increase or decrease absorption of steroids. **2** It may help the client remember to take the medication, but it is not the reason for taking it with meals. **4** The medication is not affected by an acid environment.

**Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

**200. 1 Determining fetal well-being supersedes all other measures; if the fetal heart rate (FHR) is absent or is persistently decelerating, immediate intervention is required.**

**2, 3, 4** This is important, but it is not the priority.

**Reference:** Ch 25, Intrapartum Period, Nursing Care

**201. 3 The fetal heart rate (FHR) is expected to decelerate when the head is compressed during a contraction. If the FHR returns to baseline at the end of the contraction, fetal well-being is indicated.**

**1** Cord compression during a contraction is a common occurrence; no intervention is necessary if the FHR returns to baseline at the end of the contraction. **2** There is no need for further intervention; this is an expected occurrence as long as the FHR returns to baseline at the end of the contraction. **4** This position will increase pressure on the vena cava.

**Reference:** Ch 25, Intrapartum Period, Nursing Care

**202. 4 Clients with bulimia eat to blunt emotional pain because they frequently feel unloved, inadequate, and/or unworthy; purging is precipitated to relieve feelings of guilt for bingeing and/or to limit the fear of obesity.**

**1** The bingeing and purging usually are done alone and in secret. **2** Clients with bulimia often feel out of control and perform their behaviors in secret. **3** This is one of the psychodynamic theories related to anorexia nervosa, not to bulimia nervosa.

**Reference:** Ch 20, Eating Disorders, Overview

**203. Answer: 1, 2, 3.**

**1** Irritability and emotional lability, fluctuating between euphoria and anger, are common moods associated with mania. **2** An inflated self-esteem and delusions of grandeur represent mood-congruent psychotic features of mania; clients believe that they possess extraordinary talents, that they are famous, or that they know someone famous. **3** They are extremely talkative, and their speech is rapid, with an urgent quality; they rapidly change subjects and have flight of ideas and racing thoughts. **4** This occurs most often with schizophrenia; the client loses the train of thinking and is unable to retrieve the previous thought. **5** This is related to depression; clients with mania move fast, pace, fidget, and rarely are still.

**Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Data Base

**204. 1 Circulatory collapse can be caused by exposure to an infection or by overexertion of a client with chronic adrenocortical insufficiency (Addison disease).**

**2, 3, 4** This is an appropriate room assignment because the roommate does not have a communicable infection.

**Reference:** Ch 9, Addison Disease, Nursing Care

**205. 3 Tetanus immune globulin contains ready-made antibodies and confers short-term passive immunity.**

**1** Passive immunity lasts a short time, not throughout life. **2** Immune globulins confer passive artificial immunity, not long-lasting active immunity. **4** Immune globulins are antibodies; they do not stimulate the production of antibodies.

**Reference:** Ch 13, Tetanus, Data Base

**206. 1 Because of diminished mineralocorticoid secretion, clients with Addison disease are prone to develop hyponatremia. Therefore, the addition of salt to the diet is advised.**

**2** Intake of calories and fluid is determined on an individual basis, not because the client has Addison disease. **3** Protein is not omitted from the diet; ingestion of essential amino acids is necessary for optimum metabolism. **4** Fluids are not restricted for clients with Addison disease.

**Reference:** Ch 9, Addison Disease, Nursing Care

**207. 3 Development of mood swings and psychosis is possible during long-term therapy with glucocorticoids because of fluid and electrolyte alterations.**

**1, 2, 4** This is not a response to long-term glucocorticoid therapy.

**Reference:** Ch 9, Related Pharmacology, Adrenocorticoids

**208. Answer: 1, 2, 4, 6.**

**1** These infants are either stiff and unyielding or flaccid and unresponsive. **2** These infants have difficulty reaching out to the environment and tend to be withdrawn. They get little response from parents and do not learn how to respond to others. **3** These infants show little satisfaction and are very difficult to comfort. **4** These infants show little satisfaction and are nonresponsive or minimally responsive to human contact. **5** These infants are not physically or emotionally responsive to others; they resist being held and respond in a stiff and unyielding posture. **6** These infants have social and language deficits and display minimal interest in the environment or others.

**Reference:** Ch 30, Failure to Thrive, Data Base

**209. 3 Head control and rolling over are achieved at 4 and 5 months, respectively.**

**Transferring objects from one hand to another and sitting unsupported are achieved at 7 and 8 months, respectively.**

**1, 2** This is too young; the ability to roll over is achieved by approximately 5 months of age. **4** This is too old; transferring objects from hand to hand usually is achieved at approximately 7 months.

**Reference:** Ch 30, Growth and Development, Developmental Timetable

**210. 4 Accidental overdose can cause death. Another nurse should verify accuracy of the order, dose, and pump settings to prevent harm to the client.**

**1** Although administering the loading dose over 10 minutes is an appropriate intervention, it is not the first thing the nurse should do. **2** Although monitoring for dysrhythmias is important because they are common with this medication and may be life-threatening, it is not the first thing the nurse should do. **3** Although taking the vital signs continuously during the infusion is important because the dose needs be

slowed or discontinued if the blood pressure decreases excessively, it is not the first thing the nurse should do.

**Reference:** Ch 6, Related Pharmacology, Phosphodiesterase Inhibitors

**211. 4 When emotional stress overwhelms an individual's ability to cope, the unconscious seeks to reduce stress. A conversion reaction removes the client from the stressful situation, and the conversion reaction's physical/sensory manifestation causes little or no anxiety in the individual. This lack of concern is called *la belle indifférence*.**

**1** No physiologic changes are involved with this unconscious resolution of a conflict. **2,** **3** The conversion of anxiety to physical symptoms operates on an unconscious level.

**Reference:** Ch 19, Conversion Disorders, Data Base

**212. 3 This helps the client identify behavior and feelings in a nonthreatening manner.**

**1** This judges the client, indicating a lack of acceptance. **2** The nurse's behavior is not the issue; the situation should be turned back to the client's behavior. **4** This evasion and refusal to answer will have the psychologic effect of removing the nurse from the group.

**Reference:** Ch 16, Group Therapy, Nursing Care Associated with Group Therapy

**213. Answer: 2, 4, 5.**

**1** Fatigue is associated with withdrawal from caffeine or stimulants. **2** Anxiety is a symptom that is commonly associated with withdrawal from alcohol. **3** A runny nose and tearing of the eyes are associated with withdrawal from opioids. **4** When a person is withdrawing from alcohol, associated autonomic hyperactivity causes an increased heart rate and diaphoresis. **5** The withdrawal of alcohol affects the central nervous system, resulting in excited motor activity.

**Reference:** Ch 20, Alcohol Abuse and Dependency, Nursing Care

**214. 2 Accidental ligation of a ureter is a serious complication of total abdominal hysterectomy. A decrease in urine output should be reported immediately to the surgeon.**

**1** An apical rate of 90 falls within expected limits but should be evaluated in relation to the client's previous vital signs. **3** A nasogastric tube is not inserted routinely. **4** This is expected.

**Reference:** Ch 24, Uterine Neoplasms, Nursing Care

**215. 2 Because of tissue destruction, potassium ions are liberated from the injured cells. The result is hyperkalemia.**

**1** Blood volume decreases, not increases, and hypovolemic shock may occur. **3** Capillary permeability is increased, not decreased, as a result of the inflammatory response. **4** Because of the fluid shift, glomerular filtration is decreased, leading to an increased, not decreased, specific gravity.

**Reference:** Ch 10, Burns, Data Base

**216. 4 The nurse, knowing the client was combative, was negligent in not providing close supervision; a reasonable, prudent nurse should have observed the client closely to protect against self-imposed injury and to protect others.**

**1** A client can be placed in restraints only because of current unsafe behaviors, not because of past history. **2** It is unrealistic to keep a client sedated at all times. **3** All

clients should be supervised, especially those who have a history of combativeness.

**Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**217. 3 This sets appropriate limits for the client who cannot set self-limits; it rejects the behavior but accepts the client.**

**1** This may have the effect of reinforcing the behavior rather than decreasing it. **2** This does not show acceptance of the client, nor does it help the client control behavior. **4** This does not address the problem directly; the nurse's response can confuse the client because the client may not be aware of why the nurse is refusing to talk.

**Reference:** Ch 19, Manic Episode of a Bipolar Disorder, Nursing Care

**218. 4 Exercise reduces the body's need for insulin. Increased muscle activity accelerates transport of glucose into muscle cells, thus producing an insulin-like effect.**

**1** With increased growth and associated dietary intake, the need for insulin increases during puberty. **2** An infectious process may require increased insulin. **3** Emotional stress increases the need for insulin.

**Reference:** Ch 33, Diabetes Mellitus, Data Base

**219. Answer: 2, 5.**

**1** Diarrhea with melena is not associated with cholecystitis. Melena is tarry stools associated with upper GI bleeding; diarrhea is associated with increased intestinal motility. **2** Interference with bile flow into the intestine will lead to an increasing inability to tolerate fatty foods. The unemulsified fat remains in the intestine for prolonged periods, and the result is an inhibition of stomach emptying with possible gas formation. **3** Coffee-ground emesis is indicative of gastric bleeding; it is not associated with cholecystitis. **4** Gnawing pain when the stomach is empty is associated with duodenal ulcers, not with cholecystitis. **5** The gallbladder is in the upper right quadrant of the abdomen, and when inflamed it will cause pain in this area.

**Reference:** Ch 8, Cholelithiasis/Cholecystitis, Data Base

**220. 1 Bleeding and hemorrhage are the most serious concerns. Bleeding disorders are common when bile does not flow through the intestine. Vitamin K, a fat-soluble vitamin synthesized in the small intestine, requires bile salts for its absorption; vitamin K is used by the liver to synthesize prothrombin necessary for clotting.**

**2, 3, 4** This is not as serious as the concern presented in another option.

**Reference:** Ch 8, Cholelithiasis/Cholecystitis, Nursing Care

**221. 2 Exploration of the common bile duct may cause edema; a T-tube prevents edema from obstructing the duct.**

**1** The cystic duct is ligated when the gallbladder is removed. **3** The T-tube will not prevent the formation of an abscess. **4** A T-tube can be used to inject dye for a cholangiogram, but it is not inserted for that purpose.

**Reference:** Ch 8, Cholelithiasis/Cholecystitis, Nursing Care

**222. 2 A colostomy does not function for 2 to 4 days postoperatively because of the lack of peristalsis.**

**1** Bowel sounds will be absent until peristaltic activity returns. **3** A dusky-colored, edematous-appearing stoma indicates a problem with circulation to the stoma; it

should be cherry red. **4** Red bloody drainage from the nasogastric tube indicates gastric bleeding, which is abnormal.

**Reference:** Ch 8, Cancer of Small Intestine, Colon, or Rectum; Nursing Care

**223. 4 The nurse has invaded the client's right to privacy. The client's marital status has no bearing on the needs of the client at this time.**

**1, 2** This action is an invasion of privacy. **3** There is no indication at this time that the client requires this referral.

**Reference:** Ch 2, Communication, The Nurse-Client Relationship

**224. 3 With the head and chest elevated, gravity promotes respiratory excursion; alternating side-lying positions allows for pulmonary drainage and expansion. Placing the infant in an infant seat helps to maintain these positions.**

**1** This causes the abdominal viscera to put pressure on the diaphragm, thereby impeding lung expansion. **2** It is difficult to maintain a 5-week-old infant in this position; in addition, this position will not promote rest. **4** This position will make it difficult for the lungs to expand, causing difficulty in breathing. The prone position is contraindicated for all infants because of its relationship to sudden infant death syndrome (SIDS).

**Reference:** Ch 30, Cardiac Malformations, General Nursing Care of Children with Cardiac Malformations

**225. Answer: 5, 2, 1, 4, 3.**

**5** Sociocultural (e.g., fashion, "superwoman" issues, and the diet and fitness industry), biologic, psychologic, and familial factors all influence the development of anorexia nervosa. **2** Dieting, exercise, purging, and laxatives are used to lose weight, with the resulting primary gain of a feeling of control over one's life. **1** As weight is lost, the individual feels a sense of accomplishment, and self-esteem increases. **4** Finally, secondary gains such as attention from parents and peers reinforce the behaviors associated with anorexia nervosa. **3** Continued dieting leads to multisystem dysfunction and a deterioration of physical status.

**Reference:** Ch 20, Anorexia Nervosa, Data Base

**226. 4 Immunosuppressants such as azathioprine (Imuran) and cycloSPORINE (Sandimmune, Gengraf) are given to prevent rejection and therefore depress WBCs.**

**1** An increased WBC level is associated with bacterial infection. **2** High creatinine levels do not cause leukopenia; increased creatinine levels are caused by kidney failure. **3** Rejection of the kidney does not cause leukopenia; signs of rejection include decreased urine output, increased serum creatinine, hypertension, and edema.

**Reference:** Ch 12, Chronic Kidney Failure/End-Stage Renal Disease, Nursing Care

**227. 4 This is recommended to keep weight gain to no more than 25 lb so that the increased cardiac workload that occurs during pregnancy can be controlled as much as possible.**

**1** Fats specifically are not limited; however, they should be eaten in moderation to control the total number of calories consumed. **2, 3** This is not advised for clients with cardiac problems.

**Reference:** Ch 26, Heart Disease, Nursing Care

**228. 2 This provides the opportunity for paternal-infant attachment/bonding. Touching the infant may reduce some of the father's anxiety.**

**1** Although helpful, this does not meet the need for paternal-infant attachment/bonding. **3** This does not acknowledge the father's anxiety; also, he may not be ready to absorb this information. **4** This is a simplistic approach to the father's emotional needs and does not address the father's concerns.

**Reference:** Ch 27, Foundations of Nursing Care for Newborns, Parent-Infant Relationships

**229. 2 Whole milk does not meet the infant's need for vitamin C and iron.**

**1** Whole milk contains adequate fats, but the calcium content is  $3\frac{1}{2}$  times that of human milk. **3** Whole milk contains adequate thiamine, but the sodium content is 3 times that of human milk. **4** Whole milk contains adequate carbohydrates, but the protein content is 3 times that of human milk.

**Reference:** Ch 30, Nutrition during Infancy, Guidelines for Infant Nutrition

**230. Answer: 2, 3.**

**1** Cyanosis is not commonly associated with a transfusion reaction. **2** Mismatched blood cells are attacked by antibodies, and the hemoglobin released from ruptured erythrocytes plugs the kidney tubules; this kidney involvement results in backache. **3** Shivering occurs as part of the inflammatory response associated with a transfusion reaction. **4** Tachycardia, not bradycardia, is associated with a transfusion reaction. **5** Hypotension, not hypertension, is associated with a transfusion reaction.

**Reference:** Ch 6, Related Procedures, Blood Transfusion

**231. 3 Diminished renal function usually is evidenced by a decrease in urine output to less than 100 to 400 mL/24 hours.**

**1** Glycosuria is unrelated to a transfusion reaction. **2, 4** Although this finding is related to the renal system and may reflect an acute hemolytic reaction, its presence does not necessarily indicate kidney damage.

**Reference:** Ch 12, Acute Kidney Failure, Data Base

**232. 1 Damaged kidneys are unable to excrete potassium, resulting in hyperkalemia. Potassium, part of the sodium-potassium pump, is involved with muscle contraction. The clinical manifestations indicate hyperkalemia. The expected serum level of potassium is 3.5 to 5.5 mEq/L.**

**2** Hyponatremia generally is not associated with acute renal failure; hyponatremia is associated with headache, muscle weakness, apathy, and abdominal cramps, not with an irregular pulse or diarrhea. The expected serum level of sodium is 136 to 145 mEq/L. With acute kidney failure the serum sodium may be normal, increased, or decreased. **3** Hypouricemia will not occur because serum uric acid is increased in clients with kidney failure. **4** Hypercalcemia is not associated with the assessment data listed in the scenario. The expected serum calcium level is 9.0 to 10.5 mg/dL. The serum calcium level with acute kidney failure may be slightly decreased.

**Reference:** Ch 12, Acute Kidney Failure, Data Base

**233. 2 The waste products of protein metabolism are the main cause of uremia. The degree of protein restriction is determined by the severity of the disease.**

**1** Fluid restriction may be necessary to prevent edema, heart failure, or hypertension; fluid intake does not directly influence uremia. **3** Sodium is restricted to control fluid retention, not uremia. **4** Potassium is restricted to prevent hyperkalemia, not uremia.

**Reference:** [Ch 12](#), Acute Kidney Failure, Data Base

**234. 2 If fluid is not draining adequately, the client should be positioned from side to side or with the head raised, or manual pressure should be applied to the lower abdomen to facilitate drainage.**

**1** A supine position does not facilitate drainage by gravity. **3** The health care provider, not the nurse, removes the cannula. **4** This deficit is not enough to require notifying the health care provider.

**Reference:** [Ch 12](#), Chronic Kidney Failure/End-Stage Renal Disease, Nursing Care

**235. 1 When one's effort toward meeting a goal is blocked or thwarted, frustration results. The child with special needs may be repeatedly thwarted when trying to meet developmental needs, especially in an environment where certain achievements beyond the child's ability are expected.**

**2** This does not occur. **3** This is an external factor that has little to do with the child's ability to cope with limitations. **4** This is not a frequent occurrence.

**Reference:** [Ch 29](#), The Family, Nursing Care Related to Meeting the Needs of the Family of a Child with Special Needs

**236. 1 During the first stage of alcohol detoxification, nausea and anorexia are experienced.**

**2** Irritability, not euphoria, is experienced during this stage. **3** Tachycardia, not bradycardia, is experienced during this stage. **4** Hypertension, not hypotension, is experienced during this stage.

**Reference:** [Ch 20](#), Alcohol Abuse and Dependency, Nursing Care

**237. 3 This amount of drainage is inadequate; 1000 mL of bile is expected in 24 hours via this surgically implanted tube. The presence of a mechanical obstruction (tube compression or kinking) should be determined.**

**1** This is unlikely; also, this is not an independent nursing function. **2** This is unlikely; common bile duct edema takes several days to subside. **4** A T-tube drains by gravity, not by suction.

**Reference:** [Ch 8](#), Cholelithiasis/Cholecystitis, Nursing Care

**238. 4 The situation is so traumatic that the individual may be unable to use past coping behaviors to comprehend what occurred.**

**1** This may be a later concern. The client should be the focus of care at this time. **2** Social isolation is not an immediate concern. **3** Coping skills, not thought processes, are challenged at this time.

**Reference:** [Ch 16](#), Rape Counseling, Nursing Care

**239. 2 Safety is a priority. Also, maintaining the cannula in place may be compromised if the client is confused or agitated, thus interfering with the consistent delivery of oxygen. Agitation may be an indication of hypoxia.**

**1** Although rest should be encouraged (the client could rest in a chair), the priority is that the client receives the oxygen. **3** In the adult, nasal cannulas do not come in a variety of

sizes; the elastic strap is adjustable. **4** Two liters of oxygen per minute is not contraindicated for a client with chronic obstructive pulmonary disease (COPD); if the client has COPD, levels above 2 L should be avoided to prevent the possibility of CO<sub>2</sub> narcosis.

**Reference:** Ch 7, Related Procedures, Oxygen Therapy

**240. 1 Secretions in the upper airway that interfere with the free flow of air with each breath produce gurgling sounds.**

**2** Oropharyngeal suction will not address fine crackles at the base of the lungs. **3** Cyanosis can result from a variety of problems unrelated to the presence of secretions; suctioning should be done only when secretions are blocking the airway. **4** Suctioning is not needed in the absence of accumulated oropharyngeal secretions.

**Reference:** Ch 7, Related Procedures, Suctioning of Airway

**241. 1 Isoniazid (INH) is used as a prophylactic agent for people who have been exposed to tuberculosis. Isoniazid is used in drug combinations to treat tuberculosis, which has improved compliance with drug therapy; combination drugs (e.g., Rifamate [contains rifampin, isoniazid, and pyrazinamide])**

**2** Multiple puncture tests (MPTs), such as the tine test, are used to test for tuberculosis; these are no longer recommended. They are not a treatment for the prevention or cure of tuberculosis. **3** Bacille Calmette-Guérin (BCG) is a vaccine that provides limited immunity; it is not recommended for use in the United States. **4** Purified protein derivative (PPD), the Mantoux test, is a widely used skin test for detecting tuberculosis; it is not a treatment for the prevention or treatment of tuberculosis.

**Reference:** Ch 7, Pulmonary Tuberculosis, Data Base

**242. Answer: 2, 5, 6.**

**1** Discolored toenails result from a fungus under the nail or chronic hypoxia, not varicose veins. **2** Leg fatigue is a common clinical manifestation caused by venous stasis and inadequate tissue oxygenation. **3** Localized heat in a calf is a sign of thrombophlebitis. **4** Reddened areas on a leg are indicative of thrombophlebitis. **5** Vein walls weaken and dilate, resulting in distended, protruding veins that appear tortuous and darkened. **6** As vein walls weaken and dilate, venous pressure increases and the valves become incompetent; venous stasis and inadequate oxygenation result in leg pain.

**Reference:** Ch 6, Vascular Disease: Varicose Veins, Data Base

**243. 4 As valves become incompetent, they allow blood to pool in the veins, which increases hydrostatic pressure and leads to further valve destruction. Compression hose provide external pressure, thereby facilitating venous return and minimizing blood pooling in the veins. The legs are less congested after sleeping, and therefore the hose should be put on before getting out of bed in the morning and before the legs are in the dependent position.**

**1** The client should engage in exercise such as walking or swimming because muscle contraction encourages venous return to the heart. Prolonged sitting, standing, or crossing the legs should be avoided because they reduce venous return. **2** Limiting

fluid intake will not alter the leakage of fluid or blood into the interstitial space. This occurs in response to the increased hydrostatic pressure in the veins. **3** Although applying moisturizing lotion may make the skin more supple, it will not treat enlarged and tortuous veins.

**Reference:** [Ch 6](#), Review of Anatomy and Physiology, Regulatory Mechanisms Affecting Circulation

**244. 4 Starvation or inadequate/inappropriate nutrition can lead to electrolyte imbalances, which are life-threatening.**

**1, 2** This is not the priority at this time. **3** Client independence, not separation from family members, is supported.

**Reference:** [Ch 20](#), Anorexia Nervosa, Data Base

**245. 1 Diarrhea, nausea, and vomiting are common side effects; clients should take these medications with a meal or light snack.**

**2** These drugs may cause hyperglycemia, not hypoglycemia. **3** Circumoral (perioral), not peripheral, paresthesias may occur with protease inhibitors; peripheral paresthesias may occur with nucleoside reverse transcriptase inhibitors. **4** Seeing yellow halos around lights does not occur with protease inhibitors; it may occur with digoxin toxicity.

**Reference:** [Ch 13](#), Acquired Immunodeficiency Syndrome, Data Base

**246. 4 Antioxidants in cranberry juice may inhibit the mechanism that metabolizes warfarin (Coumadin), causing elevations in the international normalized ratio (INR) and resulting in hemorrhage.**

**1, 2, 3** This juice is not contraindicated when warfarin (Coumadin) is taken.

**Reference:** [Ch 6](#), Related Pharmacology, Anticoagulants

**247. 2 By monitoring and reporting changes in the child's behavior, the health care provider can determine the effectiveness of the medication and the optimum dosage.**

**1** Parents should not be encouraged to tutor their children because there may be too much emotional interaction. **3** This child's behavior is not deliberate or easily controllable; this type of statement may lead to diminished self-esteem in the child if control does not occur. **4** Children, especially children with ADHD, need more structure than do adults.

**Reference:** [Ch 17](#), General Nursing Care of Children with Disorders First Evident in Infancy, Childhood, or Adolescence

**248. 4 Bending increases intraocular pressure and must be avoided.**

**1, 2** This is not necessary. **3** Coughing deeply increases intraocular pressure and is contraindicated.

**Reference:** [Ch 11](#), Cataract, Nursing Care

**249. 4 Nursing assistants are not permitted to reinforce, much less change, a dressing. This requires the expertise of a licensed nurse.**

**1** Nursing assistants are permitted to collect urine from a client's urinary drainage bag and communicate a patient's I&O to the nurse. **2** Obtaining vital signs, including blood pressure, of stable clients is within the scope of practice of a nursing assistant. **3** Removing boots to provide hygiene is permitted to be performed by a

nursing assistant; it is part of the activities of daily living.

**Reference:** Ch 2, Leadership and Management, Delegation

**250. 1 Epoetin (Epogen) will increase a sense of well-being, but it will not cure the underlying medical problem. This misconception needs to be corrected.**

**2** Seizures are a risk during the first 90 days of therapy, especially if the hematocrit increases more than 4 points in a two-week period. A dose adjustment may be necessary. **3** Blood transfusions may still be necessary when the client is severely anemic. **4** Supplemental iron therapy is still necessary when receiving epoetin because the increased RBC production still requires iron.

**Reference:** Ch 6, Related Pharmacology, Antianemics

**251. Answer: 1, 2, 3, 4, 5.**

**1** Anorexia and vague abdominal discomfort occur because of areas of intestinal inflammation. **2** Bleeding tendencies (e.g., petechiae, bleeding gums) occur because of decreased platelets. **3** Irritability results because of the stress of the pathophysiological changes that occur with the disease. **4** Pallor results because of decreased erythrocytes (anemia). **5** Listlessness and lethargy result because of decreased erythrocytes (anemia).

**Reference:** Ch 32, Leukemia, Data Base

**252. 4 Warm, moist heat will reduce inflammation and pain, thus promoting mobility.**

**1** Acetaminophen administered at night will not decrease pain experienced the following morning. **2** Ice will not be beneficial regardless of the time it is administered. **3** Gentle stretching, not active exercise, should be employed.

**Reference:** Ch 33, Juvenile Idiopathic Arthritis, Nursing Care

**253. 4 After a suprapubic prostatectomy, leakage of urine generally is identified around the suprapubic tube. This creates an environment in which bacteria can flourish if the dressing is not changed frequently.**

**1** Uremia is caused by inadequate kidney function; it is not directly related to bladder infection. **2** Negative pressure on the bladder may traumatize the delicate tissue; urine should flow via gravity. **3** Clamping off the tube causes urinary stasis, which increases the risk for infection.

**Reference:** Ch 12, Benign Prostatic Hyperplasia, Nursing Care

**254. Answer: 360 mg per day. First compute the client's weight in kilograms and then compute the dosage. Use the "Desired over Have" formula of ratio and proportion to solve this problem.**

$$\frac{\text{Desired}}{\text{Have}} = \frac{176 \text{ lb}}{2.2 \text{ lb}} = \frac{x \text{ kg}}{1 \text{ kg}}$$

$$\begin{aligned}
 2.2 \times &= 176 \\
 x &= 176 \div 2.2 \\
 x &= 80 \text{ kg}
 \end{aligned}$$

$$\begin{array}{rcl}
 \text{Desired} & \frac{80 \text{ kg}}{1 \text{ kg}} & \times \frac{x \text{ mg}}{8 \text{ mg}} \\
 \text{Have} & & 
 \end{array}$$

$$\begin{aligned}
 1 \times &= 80 \times 8 \\
 x &= 640 \text{ mg}
 \end{aligned}$$

**Reference:** Ch 2, Medication Administration, Nursing Responsibilities Related to Medication Administration

**255. 4 Keeping a record of what one eats helps to limit unconscious and nervous eating by making the individual aware of intake.**

**1** Limiting calories to 900 per day is a severe restriction that requires a health care provider's order. **2** Exercise causes rapid head movements, which may precipitate a Ménière's attack. **3** Although this is a therapeutic intervention, the nurse first should make suggestions that help increase the client's awareness of personal eating habits.

**Reference:** Ch 8, Obesity, Nursing Care

**256. 4 A liquid iron preparation may stain tooth enamel; therefore, it should be diluted and administered through a straw.**

**1** Constipation, rather than loose stools, often results from the administration of iron. **2** To avoid gastric irritation, iron should be given with food. **3** To improve absorption, iron may be given with orange juice.

**Reference:** Ch 31, Health Promotion of Toddlers, Childhood Nutrition

**257. 2 Selegiline (Eldepryl) concurrently used with an opioid analgesic can result in a fatal reaction (e.g., excitation, rigidity, hypertension, hypotension, coma).**

**1** Foods high in tyramine (e.g., cheese, wine, beer, pickled products) should be avoided, not encouraged. When foods high in tyramine are broken down, they release specific biogenic amines. When the breakdown of these biogenic amines is inhibited by monoamine oxidase inhibitors, such as selegiline, pressor substances accumulate in the body, causing a quick increase in blood pressure to excessively high levels, precipitating intracranial bleeding and death. **3** It is recommended that this medication be taken at breakfast and lunch when its effects are more apparent while the client is awake; it should not be taken in the evening or at bedtime. **4** This medication does not influence serum glucose levels. It can produce false positive or negative results for glycosuria.

**Reference:** Ch 11, Related Pharmacology, Antiparkinson Agents

**258. 3 The added cardiac workload of individuals with anemia who are receiving transfusions increases the risk for heart failure that leads to pulmonary edema.**

**1, 2, 4** Although this may occur, a child with  $\beta$ -Thalassemia does not have an increased risk of developing this complication.

**Reference:** [Ch 31](#),  $\beta$ -Thalassemia, Nursing Care

**259. 4 This disorder interferes with the ability to perceive and respond to sensory stimuli, which causes a deficit in interpreting new sensory data and makes learning difficult.**

**1, 3** This is not necessarily true. **2** It is not an intellectual deficit that prevents learning but rather a perceptual difficulty; these children may have superior intelligence.

**Reference:** [Ch 17](#), Attention Deficit Hyperactivity Disorder, Data Base

**260. 1 Because the client is paralyzed and movement is compromised, daily inspection to determine the presence of reddened areas or lesions is necessary so that treatment can be initiated quickly. Identifying gross clinical changes is within the scope of practice of home health aides.**

**2** This may contribute to circumscribed pressure, which can lead to skin breakdown.

Rubber promotes perspiration, which increases the risk of pressure ulcers. **3** Massage of reddened areas may cause further damage and should be avoided. **4** Because sensation may be compromised, a heating pad should not be used.

**Reference:** [Ch 10](#), Pressure Ulcers, Nursing Care

**261. 4 Until the client learns new ways of coping with anxiety, this pattern of behavior will continue. Learning new ways to deal with stress will break the pattern.**

**1** This will avoid the problem. **2** This will reinforce the sick role. **3** A certain amount of stress is present in everyday family situations; the elimination of stress is impossible.

**Reference:** [Ch 19](#), General Nursing Care of Clients with Anxiety Disorders

**262. 3 Documentation of nursing findings during assessment is a nursing function. This facilitates early treatment.**

**1** This medical intervention is beyond the scope of nursing practice. **2** Inadequate oral hygiene has not been identified as a cause of plaques; once-daily treatment is insufficient for anyone. **4** Candida is a frequent secondary infection in clients with AIDS; it is treated when present.

**Reference:** [Ch 13](#), Acquired Immunodeficiency Syndrome, Data Base

**263. 4 Using soap and water, and protective ointment helps maintain skin integrity and prevent infection.**

**1** Applying an oil-based ointment is contraindicated because it will interfere with adherence of the appliance. **2** Soap and water are adequate unless peroxide is specifically prescribed by the health care provider; gauze bandages generally are not applied around or over a stoma. **3** Rubbing may be irritating and may promote conditions that contribute to infection.

**Reference:** [Ch 8](#), Related Procedures, Colostomy Irrigation

**264. 2 Few physical restraints on activity are required postoperatively, but the client may have emotional problems as a result of body image changes.**

**1** Swimming is not prohibited because water does not harm the stoma. **3** Activities of

daily living (ADLs) are resumed 6 to 8 weeks after surgery. **4** No changes in lifestyle are necessary.

**Reference:** [Ch 8](#), Cancer of Small Intestine, Colon, or Rectum; Nursing Care

**265. 1 Antidiuretic hormone (ADH) causes water retention, resulting in decreased urine output.**

**2** ADH acts on nephrons to cause water to be reabsorbed from glomerular filtrate, leading to an increased specific gravity of urine. **3** The client is overhydrated so that serum sodium is decreased. **4** Blood volume may increase, causing dilution of nitrogenous wastes in the blood.

**Reference:** [Ch 9](#), Syndrome of Inappropriate Antidiuretic Hormone Secretion, Data Base

# CHAPTER 37

# Study Worksheets for Reviewing Your Test-Taking Performance

---

# Introduction

Two comprehensive examinations have been included with this book. Comprehensive Examination 1 appears in the book and on the companion CD, and Comprehensive Examination 2 appears just on the companion CD. The questions in these examinations have been developed to reflect the current NCLEX-RN computer adaptive test (CAT). Their purpose is to provide an opportunity for test takers to experience a testing situation that approximates the NCLEX-RN examination. These questions cross clinical disciplines and require the test taker to respond to individual and specific needs associated with common health problems and nursing responsibilities. Answers and Rationales are provided for each question. The rationales for correct and incorrect options introduce or reinforce the theories, principles, concepts, and information contained within the practice of nursing. The NCLEX-RN test plan classifications are a reference to the chapter and section where information contained in the question can be found in Mosby's Comprehensive Review of Nursing does not appear at the end of each question's answer and rationale in the book for Comprehensive Examination 1; however, this information for both Comprehensive Examinations is included on the companion CD. These examinations on the CD provide an opportunity for students to take computerized comprehensive examinations.

# How to Maximize Use of the Comprehensive Examinations

To achieve maximum learning from the experience of taking an integrated, comprehensive examination, we have divided each Comprehensive Examination into two sections. Part A contains 75 questions, which is the minimum number of questions every candidate must answer on the NCLEX-RN. Part B contains 190 questions. Part B and Part A together total 265 questions, the maximum number of questions on the NCLEX-RN examination.

With Comprehensive Examination 1, we recommend that you review the answers and rationales and the classifications of questions for each part as you complete it. In Comprehensive Examination 2, which appears on the Companion CD, you should wait until you have completed both parts before checking the answers and rationales and classifications of questions. We have made these recommendations so Test 1 will reinforce your immediate learning and so Test 2, although it also reinforces learning, will better reflect the actual situation that you will experience when you take the computerized NCLEX-RN examination.

To help you analyze your mistakes on the comprehensive examinations and to provide a database for making study plans, Focus for Study worksheets have been included in this chapter to help you identify and record errors in the way you process information and to help you identify and record gaps in knowledge. Follow the directions that appear below under HOW TO DEVELOP A FOCUS FOR STUDY. As you review material in notes or in this book, pay attention to correcting your most common problems and identifying the topics you should review further. It might be helpful to set priorities; review the most difficult topics first so that you will have time to review them more than once. The worksheets can be used to focus your future study. Remember, if you study the proper subject matter, the knowledge you gain will provide you with the ability to answer questions, regardless of the medium used to ask the question, because the required knowledge of the subject matter does not change.

# How to Develop a Focus for Study

You will find two Focus for Study Worksheets on pp. 820-824.

- Focus for Study Worksheet–Adapted NCLEX-RN® Test Plan
- Focus for Study Worksheet–Content Areas

These Focus for Study Worksheets should be used at the completion of each Comprehensive Examination to analyze each question that you answered incorrectly. It is important that you take the time to complete the worksheets carefully. The resulting information will assist you in identifying areas of strength and weakness and will help you to use your study time effectively and efficiently.

## Focus for Study Worksheet: Adapted NCLEX-RN® Test Plan

This worksheet has 19 columns across the top. The first column allows you to insert the number of the question that you answered incorrectly. Eight columns are the subclassifications of Client Need; six columns are the subclassifications of Integrated Processes (including the Nursing Process); and four columns are the subclassifications of the Cognitive Level of the question. **These classifications can be found in Introduction for Students Preparing for the NCLEX-RN® Examination in the beginning of this book.**

To develop a meaningful focus of study, simply follow these directions.

1. In the Comprehensive Examination, reread the question that you missed.
2. In the Answers and Rationales section, read the rationale for the correct answer and the rationales for all the incorrect options.
3. Reread the answer you chose, and read the reason your answer was incorrect.
4. Place the number of the question you got wrong in its own box in the first column.
5. Look at the classifications for the question that accompany the answers and rationales for the question. Place an X in the box on the Focus for Study Worksheet–Adapted NCLEX-RN Test Plan that relates to Client Need, Integrated Processes (including Nursing Process), and Cognitive Level for the question.
6. Perform steps 1 through 5 for each question that you got wrong.
7. At the completion of your review of the questions you got wrong, count the Xs in each column and put the total at the bottom of the column.

At the completion of this process, you will have an overview of where you made mistakes in relation to the NCLEX-RN test plan. You may see a pattern of errors that will provide a direction for studying.

## Focus for Study Worksheet Reference/Chapter

This worksheet has eight columns. The first column lists Content Areas that reflect a broad classification of information that is essential to the practice of nursing. These content areas mirror the chapters in Mosby's Comprehensive Review of Nursing for the NCLEX-RN Examination. The other seven columns reflect specific information that crosses clinical disciplines: Pathophysiology, Pharmacology, Nutrition, Diagnostic

Studies, Developmental Factors, Physical Care, and Emotional Care.

To develop a meaningful focus of study, simply follow these directions.

1. In the Comprehensive Examination, reread the question that you missed.
2. In the Answers and Rationales section, read the rationale for the correct answer, as well as the rationales for all incorrect options.
3. Reread the answer you chose, and read the reason your answer was incorrect.
4. Identify the Reference for the question by looking at the group of classifications that accompanies the rationale for the question. Next to Reference will be the chapter and the headings under which the information in the question is reviewed in this book. Find this content area in column one of the worksheet, Reference/Chapter.
5. Look at the question you missed, and decide where the subject matter that is being tested best fits under one of the headings in the first horizontal row of the worksheet (Pathophysiology & Basic Sciences, Pharmacology, Nutrition, Diagnostic Studies, Developmental Factors, Physical Care, and Emotional Care).
6. Write the number of the question you got wrong in the box that intersects the content area row and the appropriate heading in the vertical column of the worksheet. Make your numbers small so that more than one question number can fit in a box if necessary.
7. Perform steps 1 through 6 for each question you got wrong.

At the completion of this process, you will be able to identify the areas of knowledge in which you missed the greatest number of questions. These gaps require additional study. You can access a review of the information tested in the question by going to the appropriate chapter and heading in Mosby's Comprehensive Review of Nursing for the NCLEX-RN Examination that is listed next to Reference in the classifications that follow each question's answers and rationales. Also, the topics in the worksheets can be found in the index of most nursing textbooks. Therefore, you can use whatever text or resource material is available to you and with which you are already familiar.

As you review material in class notes or in this book, pay attention to correcting your most common problems and identifying the topics you should review further. It might be helpful to set priorities; review the most difficult topics first so that you will have time to review them more than once. Remember, if you study the proper subject matter, the knowledge you gain will provide you with the ability to answer questions, regardless of the medium used to ask the question, because the required knowledge of the subject matter does not change.

Two-health care provider commitment, [414](#)

Typhoid fever, [252-253](#)

Tyramine, [490](#)

## U

Ulcerative colitis, [162-163](#), [163f](#), [354](#)

Ulcers, [85](#), [277](#)

    pressure, [187-190](#), [187f](#), [189f-190f](#), [293-294](#), [369](#), [383](#)

Ultrasonography, [550](#), [584](#), [587](#), [595](#)

Umbilical cord, [536](#)

Unconscious, the, [407](#)

Undoing, [412](#)

Unspecified conduct disorder, [429](#), [495](#)

Ureteral calculi, [309](#), [393](#)

Ureteral colic, [309](#), [393](#)

Ureters, [236](#), [393](#)

Urethra, [236](#), [237f](#), [308](#), [391-392](#)

displaced urethral openings, [660](#)

Urinary bladder, [236](#)

continuous irrigation, [239](#), [239f](#)

exstrophy of the, [659-660](#), [712](#)

lacerations, [66](#)

Urinary catheterization, [238-239](#), [308-310](#)

Urinary/reproductive system

anatomy and physiology

female reproductive system, [237](#), [237f](#)

male reproductive system, [236-237](#), [237f](#)

urinary system functions, [235](#)

urinary system structures, [235-236](#), [236f](#)

child, [639](#)

disorders

acute kidney failure, [241-242](#)

adenocarcinoma of the kidneys, [244](#)

benign prostatic hyperplasia, [245-247](#)

bladder tumors, [245](#)

cancer of the prostate, [247](#)

cancer of the testes, [247-248](#)

chronic kidney failure, [242-244](#)

glomerulonephritis, [244-245](#)

urinary tract infection, [240](#)

urolithiasis and nephrolithiasis, [240-241](#)

malformations, [659-660](#)

microorganisms and, [238](#)

nursing care

acute kidney failure, [242](#)

adenocarcinoma of the kidney, [244](#)

benign prostatic hyperplasia, [246-247](#)

bladder tumors, [245](#)

cancer of the prostate, [247](#)

cancer of the testes, [248](#)

chronic kidney failure, [243-244](#)

glomerulonephritis, [244-245](#)

urinary tract infections, [240](#)

urolithiasis and nephrolithiasis, [241](#)

overview, [235-239](#)

pharmacology

androgens, [238](#)

kidney-specific antiinfectives, [238](#)

sulfonamides, [238](#)

urinary spasmolytics, [238](#)

procedures

continuous bladder irrigation, [239](#), [239f](#)

urinary catheterization, [238-239](#)

Urinary tract infections (UTIS), [240](#), [308-309](#)

in children, [693-694](#)

Urine, [235](#), [392](#)

Urolithiasis, [240-241](#)

Uterine fibroids, [528](#), [582](#)

Uterine neoplasms, [528-529](#)

Uterus, [519](#)

prolapsed, [531-532](#), [582](#)

## V

Vaccinations *See* [Immunizations/vaccinations](#)

Vacuum aspiration, [525](#)

Vacuum extraction, [563](#)

Vagina, [519](#)

Vaginal ring, [522](#)

Vaginitis, [529-530](#)

Valacyclovir, [194](#)

Valproates, [204](#), [423](#)

Valproic acid, [204](#), [491](#)

Valsartan, [97](#), [263](#), [318](#)

Values and health, [11](#)

Valves, heart, [93](#)

Vancomycin-resistant enterococcus (VRE), [253](#)

Van deferens, [236](#), [237f](#)

Varicella vaccine, [646](#), [718](#), [747](#)

Varicose veins, [113-114](#), [262](#)

Vasectomy, [522](#), [580](#), [604](#)

Vasoconstriction, [92](#)

Vasodilators, [263](#)

coronary, [97](#)

direct, [98](#)

Vasopressin, [98](#)

hepatic cirrhosis and, [158](#)

receptor antagonists, [175](#)

Venlafaxine, [419](#), [422](#)

Venous insufficiency, chronic, [261](#), [268](#), [331-332](#)

Ventilation, mechanical, [126-127](#), [127f](#), [274](#)

Ventricles and cerebral aqueduct, brain, [198](#)

Ventricular fibrillation, [104](#), [104f](#), [265](#), [326-327](#)

Ventricular septal defect (VSD), [653-654](#), [654f](#), [711](#), [717](#)

Ventricular tachycardia, [104](#), [104f](#), [326-327](#)

Venturi mask, [274](#), [732-733](#)

Verapamil, [96](#)

Verbal communication, [15](#)

Vermiform appendix, [139](#)

Vicodin, [316](#)

Vinca alkaloids, [46](#)

VinCRISTine, [317](#), [404](#), [727](#), [769](#)

Violence, nursing care in relation to, [417-418](#)

Viral infectious gastroenteritis, [253-254](#)

Viral pathogens, [30](#)

- respiratory system disorders and, [122](#)
- urinary/reproductive system disorders and, [238](#)

Viscosity, blood, [91](#), [331](#)

Vision, [201](#) *See also* [Eyes](#)

- cataract and, [232](#)
- changes, [214](#)
- detached retina and, [233](#)
- glaucoma and, [232-233](#)
- impaired, [684-685](#), [722](#)

Vital capacity, lungs, [120](#)

Vitamin A acid, [186](#)

Vitamins, [140](#), [275](#), [315](#), [319](#), [332](#), [341](#)

- alcoholism and, [279-280](#)
- wound healing and, [65](#), [85](#)

Volume, blood, [91](#)

Voluntary admission, [414](#)

Vomiting, [60](#), [712](#)

- in infants, [666](#), [744-745](#)

Voyeurism, [456](#)

Vulva, [519](#)

## W

Walkers, [211](#), [387](#)

Warfarin, [99](#), [264](#), [268-269](#), [314-316](#), [399](#), [401-402](#)

Water exercise, [305](#)

Weight loss, [64](#)

- fluid, [60](#)

Wernicke's encephalopathy, [479](#)

West Nile virus (WNV), [258-259](#)

Wheelchairs, [211](#)

Wheezes, [122](#)

White blood cells, [91](#)

Wilms tumor, [692](#), [728](#), [762](#)

Withdrawal behavior, [411-413](#)

Women's health *See also* [Pregnancy](#)

- benign breast disease, [532-533](#)

- cancer of the breast, [66](#), [87](#), [533-534](#)

- contraceptive methods and, [521-522](#)

- disorders

  - cancer of the cervix, [66](#), [87](#), [527-528](#)

  - cancer of the ovary, [529](#)

  - cystocele and/or rectocele, [532](#)

  - endometriosis, [530](#)

  - osteoporosis, [260](#), [286](#), [319-320](#), [534-535](#)

  - pelvic inflammatory disease, [531](#)

  - prolapsed uterus, [531-532](#)

  - toxic shock syndrome, [530-531](#)

  - uterine neoplasms, [528-529](#)

  - vaginitis, [529-530](#)

- family planning and, [520-523](#)

- female reproductive system and, [519-520](#)

- infertility and sterility in, [522-523](#)

- male reproductive system and, [520](#)

- menstrual cycle in, [520-521](#)

- perimenopause and, [521](#)

- pharmacology, [525-526](#)

- procedures, [523-525](#)

- promotion, [519-521](#)

Working phase, nurse-client relationship, [16](#)

Wounds

- contaminated, [63](#)

- drainage, [44-45](#), [44t](#), [59](#), [65](#), [77](#), [83-85](#)

- healing, [65](#), [85](#)

## X

Xanthines, [122](#)

X-rays, [142](#)

**Y**

Young adults, [88](#)

Young-older adults, [89](#)

**Z**

Zafirlukast, [122](#), [694](#)

Zaleplon, [419](#)

Zileutin, [122](#)

Ziprasidone, [420](#), [423](#), [492](#)

Zoledronic acid, [205](#)

Zollinger-Ellison syndrome, [151](#)

Zolpidem, [419](#)
